- PUPILS** to whom this textbook is issued must not write on any page or mark any part of it in any way, consumable textbooks excepted.
1. Teachers should see that the pupil's name is clearly written in ink in the spaces above in every book issued.
 2. The following terms should be used in recording the condition of the book: New; Good; Fair; Poor; Bad.

Physical Science

with Earth Science

Features of *Physical Science with Earth Science*

- Chapter and section correlations to the Sunshine State Standards are listed.
- Chapter review and Standardized Test Practice in every chapter are correlated to the science Benchmarks.
- FCAT Vocabulary words are identified in each section, the chapter review, and in the glossary.

Additional Florida Resources

- **Succeeding On the FCAT** CD-ROM is a diagnostic and prescriptive student tutorial that provides FCAT questions and compiles class data to measure Benchmark mastery.
- **StudentWorks™ Plus** CD-ROM provides an all-in-one interactive Student Edition and student resources—a backpack solution in Spanish, Haitian Creole, and English.
- **Interactive Chalkboard** CD-ROM provides customizable Microsoft® PowerPoint® presentations correlated to the Sunshine State Standards.
- **TeacherWorks™** CD-ROM is a complete lesson planner and resource center correlated to the Sunshine State Standards.
 - **FCAT Pacing Guide** is a year-long planning guide that prioritizes content, allowing you to focus class time on important FCAT concepts.
 - **Florida Planning Guide for Continuous Improvement** provides assignment plans, benchmark progress charts, and diagnostic and prescriptive tools to help you ensure that students of all ability levels master the FCAT.
- **Curriculum Mapping** provides correlations to the Sunshine State Standards for you to quickly identify how *Physical Science with Earth Science* meets and exceeds these standards.
- **Mastering the FCAT** provides Benchmark-based pretests and posttests in FCAT format.
- **Reading Essentials, A Florida Interactive Student Textbook** presents each chapter at a lower reading level to help struggling readers master the content.
- **Video Labs, Virtual Labs, the Science Lab Manual, the Probeware Lab Manual, and the Science Inquiry Lab Manual** provide additional opportunities to learn and practice laboratory techniques.

SAFETY SYMBOLS

SAFETY SYMBOLS		HAZARD	EXAMPLES	PRECAUTION	REMEDY
DISPOSAL		Special disposal procedures need to be followed.	certain chemicals, living organisms	Do not dispose of these materials in the sink or trash can.	Dispose of wastes as directed by your teacher.
BIOLOGICAL		Organisms or other biological materials that might be harmful to humans	bacteria, fungi, blood, unpreserved tissues, plant materials	Avoid skin contact with these materials. Wear mask or gloves.	Notify your teacher if you suspect contact with material. Wash hands thoroughly.
EXTREME TEMPERATURE		Objects that can burn skin by being too cold or too hot	boiling liquids, hot plates, dry ice, liquid nitrogen	Use proper protection when handling.	Go to your teacher for first aid.
SHARP OBJECT		Use of tools or glassware that can easily puncture or slice skin	razor blades, pins, scalpels, pointed tools, dissecting probes, broken glass	Practice common-sense behavior and follow guidelines for use of the tool.	Go to your teacher for first aid.
FUME		Possible danger to respiratory tract from fumes	ammonia, acetone, nail polish remover, heated sulfur, moth balls	Make sure there is good ventilation. Never smell fumes directly. Wear a mask.	Leave foul area and notify your teacher immediately.
ELECTRICAL		Possible danger from electrical shock or burn	improper grounding, liquid spills, short circuits, exposed wires	Double-check setup with teacher. Check condition of wires and apparatus.	Do not attempt to fix electrical problems. Notify your teacher immediately.
IRRITANT		Substances that can irritate the skin or mucous membranes of the respiratory tract	pollen, moth balls, steel wool, fiberglass, potassium permanganate	Wear dust mask and gloves. Practice extra care when handling these materials.	Go to your teacher for first aid.
CHEMICAL		Chemicals can react with and destroy tissue and other materials	bleaches such as hydrogen peroxide; acids such as sulfuric acid, hydrochloric acid; bases such as ammonia, sodium hydroxide	Wear goggles, gloves, and an apron.	Immediately flush the affected area with water and notify your teacher.
TOXIC		Substance may be poisonous if touched, inhaled, or swallowed.	mercury, many metal compounds, iodine, poinsettia plant parts	Follow your teacher's instructions.	Always wash hands thoroughly after use. Go to your teacher for first aid.
FLAMMABLE		Flammable chemicals may be ignited by open flame, spark, or exposed heat.	alcohol, kerosene, potassium permanganate	Avoid open flames and heat when using flammable chemicals.	Notify your teacher immediately. Use fire safety equipment if applicable.
OPEN FLAME		Open flame in use, may cause fire.	hair, clothing, paper, synthetic materials	Tie back hair and loose clothing. Follow teacher's instruction on lighting and extinguishing flames.	Notify your teacher immediately. Use fire safety equipment if applicable.

Eye Safety

Proper eye protection should be worn at all times by anyone performing or observing science activities.

Clothing Protection

This symbol appears when substances could stain or burn clothing.

Animal Safety

This symbol appears when safety of animals and students must be ensured.

Handwashing

After the lab, wash hands with soap and water before removing goggles.

WHAT IS THE FCAT?

The **Florida Comprehensive Assessment Test (FCAT)** is part of Florida's effort to improve the teaching and learning of a higher level of standards. The primary purpose is to assess student mastery of the skills represented in the Sunshine State Standards (SSS) in reading, writing, mathematics, and science. The SSS portion of the FCAT is a criterion-referenced test.

A secondary purpose is to compare the performance of Florida students to the performance of students across the nation using a norm-referenced test (NRT) of reading and mathematics. All students in grades 3–10 take the Reading and Math FCAT in the spring of each year. All students in grades 4, 8, and 10 take the Writing FCAT. All students in grades 5, 8, and 11 take the Science FCAT.

Interpreting Benchmark Identifiers

The Sunshine State Standards are organized as eight major clusters called Strands:

- A The Nature of Matter
- B Energy
- C Force and Motion
- D Processes that Shape the Earth
- E Earth and Space
- F Processes of Life
- G How Living Things Interact with Their Environment
- H The Nature of Science

Major topics under each Strand are called Standards. Each Standard has one or more Benchmarks. Florida uses a unique naming system to identify Strands, Standards, and Benchmarks. Here is how to interpret the Benchmark identifier **SC.B.1.4.1**.

Every chapter begins with a list of the Sunshine State Standards covered in the chapter.

chapter
25

Nuclear Changes

SC.8.14 This student understands the basic principles of atomic theory. SC.8.14.7 This student understands that energy may be changed in form with varying efficiency. Also covers SC.8.2.4, SC.8.2.4.1, SC.8.2.4.2, SC.8.2.4.3

section
2

Nuclear Decay

SCA.2.4.3 The student knows that a number of elements have heavier, unstable nuclei that decay spontaneously giving off smaller particles and waves that result in a small loss of mass and release a large amount of energy.

Also covers SC.8.2.4.5

Reading Guide

What You'll Learn

- Compare and contrast alpha, beta, and gamma radiation.
- Define the half-life of a radioactive material.
- Describe the process of radioactive dating.

Why It's Important

Nuclear decay produces nuclear radiation that can both harm people and be useful.

Review Vocabulary

electromagnetic wave: a transverse wave consisting of vibrating electric and magnetic fields.

New Vocabulary

- alpha particle
- transmutation
- beta particle
- gamma ray
- half-life

Nuclear Radiation

When an unstable nucleus decays, particles and energy called nuclear radiation are emitted from the nucleus.

Benchmark correlations are listed at the beginning of a section.

Assessed Benchmarks are listed in the Chapter Review.

FCAT vocabulary words are identified in the vocabulary list at the beginning of a section and in the chapter review.

chapter
25 Review

Using Vocabulary

- alpha particle (p. 791)
- beta particle (p. 791)
- bubble chamber (p. 791)
- chain reaction (p. 802)
- cloud chamber (p. 796)
- critical mass (p. 802)
- gamma ray (p. 791)
- Geiger counter (p. 796)
- half-life (p. 794)
- nuclear fission (p. 801)
- nuclear fusion (p. 801)
- radioactivity (p. 796)
- strong force (p. 791)
- tracer (p. 804)
- transmutation (p. 792)

FCAT Vocabulary Use what you know about the vocabulary words to answer the questions in the review.

- What is an electron that is produced when a neutron decays called?
 - an alpha particle
 - a beta particle
 - gamma radiation
 - a neutron
- Which of the following describes an isotope's half-life?
 - a constant time interval
 - a varied time interval
 - an increasing time interval

Standardized Test Practice pages have assessed Benchmarks above applicable questions.

chapter
25 Standardized Test Practice

Standardized
Test Practice

Record your answers on the answer sheet provided by your teacher or on a sheet of paper. The assessed Florida Benchmark appears above the question.

Multiple Choice

- If a radioactive material has a half-life of 10 years, what fraction of the material will remain after 30 years?
 - one-half
 - one-third
 - one-fourth
 - one-eighth
- Which of the following statements is true about all the isotopes of an element?
 - They have the same mass number.
 - They have different numbers of protons.
 - They have different numbers of neutrons.
 - They have the same number of neutrons.

- SCA.2.4.3
- How does the beta decay of a nucleus cause the nucleus to change?
 - The number of protons increases.
 - The number of neutrons increases.
 - The number of protons decreases.
 - The number of protons plus the number of neutrons decreases.

Use the illustration below to answer question 4.

- Which is a true statement about the two nuclei?
 - They have the same atomic number.
 - They have the same mass number.
 - They have different numbers of electrons.
 - They have different numbers of protons.
- What is the atomic number of a nucleus equal to?
 - the number of neutrons
 - the number of protons
 - the number of neutrons and protons
 - the number of neutrons minus the number of protons

- SCA.2.4.3
- What process is shown by this illustration?
 - nuclear fusion
 - chain reaction
 - transmutation
 - beta decay

Test-Taking Tip

Understand the Question: Be sure you understand the question before you read the answer choices. Make special note of words like NOT or EXCEPT. Read and consider all the answer choices before you mark your answer sheet.

SC.8.14

- How do the total charge and total mass number of the products compare to the charge and mass number of the polonium nucleus?
 - The charges are equal but the mass numbers are not equal.
 - The mass numbers are equal but the charges are not equal.
 - Neither the mass numbers or the charges are equal.
 - The mass numbers and charges are equal.
- Radioactive isotopes of which element are used to study the brain?
 - uranium
 - fluorine
 - carbon
 - lead

Gridded Response

Use the table below to answer questions 9 and 10.

Isotope	Half-life
Carbon-14	5,730 years
Potassium-40	1.28 billion years
Iodine-131	8.04 days
Radium-222	4 days

- How many grams of an 80-g sample of carbon-14 will be left after 17,190 years?

SC.8.14

- A sample containing which radioactive isotope will have one-eighth of the isotope left after 24 days?

Short Response

SC.8.14

- When the boron isotope boron-10 is bombarded with neutrons, it absorbs a neutron and then emits an alpha particle. Identify the isotope that is formed in this process.

Extended Response

- SC.8.14
- Compare the strength of the strong force and the strength of the electric force on a proton in a small nucleus and in a large nucleus.

Use the illustration below to answer question 13.

- In the figure above, nuclear radiation is escaping from a small hole in the lead box.

PART A Which type of nuclear radiation is escaping from a small hole in the lead box, and why is this radiation deflected toward this electrode?

PART B Explain why the radiation that struck the photographic plate was not detected by the electrodes.

How should I prepare for the FCAT?

When preparing for the FCAT, the best thing to do is practice. Solving example questions ahead of time will help you prepare and become more comfortable with the different types of question-and-answer formats that appear on the test. Depending on your grade and the subject matter of the test, questions have any of several different formats.

Multiple Choice

Multiple-choice items are worth one point each. These questions require you to choose the **best** answer from four possible choices. Answer choices are lettered with “A, B, C, D” or “F, G, H, I”. Choose your answer by filling in the correct bubble.

- 1** A homeowner accidentally used a chemical treatment that eliminated the bacteria in the lawn. What would be the long-term effect of such an action?

- A. an increase in nests in the lawn area
- B. a need to pull more weeds from the lawn area
- C. a need to fertilize the lawn area with plant nutrients
- D. an increase in the number of rodents in the lawn area

1	☐ A	☐ B	☐ C	☐ D
2	☐ F	☐ G	☐ H	☐ I

FCAT TIPS

Read Carefully Be sure you understand the question before you read the answer choices. Make special note of words like NOT or EXCEPT. Read and consider all the answer choices before you mark your answer sheet.

When in Doubt If you don't know the answer to a multiple-choice question, try to eliminate as many incorrect answers as possible. Mark your best guess from the remaining answers before moving on to the next question.

Mark Your Answer Sheet Carefully Be sure to fill in the answer bubbles completely. Do not make any stray marks around answer spaces.

Gridded response questions are worth one point each. These questions require you to solve problems and then mark your numerical answer on an answer grid. You must fill in the bubbles accurately to receive credit for your answer.

Answer Grid Key

- ➔ Answer boxes
- ➔ Fraction bar
- ➔ Decimal point
- ➔ Number bubbles

Directions for Filling in Answer Grids

- Print your answer with the first digit in the first box **OR** the last digit in the last box.
- Print only one digit in each box. **DO NOT** leave a blank box in the middle of an answer.
- Include the decimal point or fraction bar if it is part of the answer.
- Fill in **ONLY** one bubble for each answer box. **DO NOT** fill in a bubble under an unused answer box.
- **DO NOT** write a mixed number such as $2\frac{1}{2}$. If this is your answer, you must first convert it to an improper fraction, $\frac{5}{2}$, or to a decimal, 2.5.

FCAT TIPS

Calculators When working with calculators, use careful and deliberate keystrokes. Calculators will display an incorrect answer if you press the wrong keys or press keys too quickly. Remember to check your answer to make sure that it is reasonable.

Be Careful For each question, make sure that you are filling in the correct answer bubble for the question number you are working on.

Be Prepared Bring at least two sharpened No. 2 pencils and a good eraser to the test. Before the test, make sure that your eraser erases completely.

Clear Your Calculator When using a calculator, always press CLEAR before starting a new problem.

- 1 The graph below shows the percentage of municipal wastes that were recycled between 1960 and 2000.

How much more waste, in percent, was recycled in 2000 than in 1960?

Each of the four grids below shows an acceptable response.

acceptable fraction answers

Guide to FCAT Success

Short Response

Short-response items are worth zero to two points depending on your answer. These questions ask you to respond in your own words or to show solutions in a concise manner. Spend about five minutes answering each short-response question.

READ
INQUIRE
EXPLAIN

- 1** Katrina collects a specimen in the forest. She wants to determine if the specimen is a living thing. Describe the characteristics the specimen must have to be considered a living thing.

The specimen must be organized into a cell or cells, respond to stimuli, use energy, grow and develop, and reproduce.

FCAT TIPS

Show All Your Work For “Read, Inquire, Explain” questions, show all of your work and any calculations on your answer sheet.

Write Clearly Neatly write your explanations in clear, concise language. Use only the space provided in the answer book.

Double-Check Your Answer When you have answered a question, reread your answer to make sure it is reasonable and that it is the *best* answer to the question.

Practice Remember that test-taking skills can improve with practice. If possible, take at least one practice test to familiarize yourself with the test format and instructions.

Get Enough Sleep Do not cram the night before the test. It can confuse you and make you tired.

Pay Attention Listen carefully to the instructions from the teacher and carefully read the directions and each question.

Extended Response

Extended-response items are worth between zero and four points depending on your answer. These questions require you to provide a longer, more detailed response. Allow 10–15 minutes to answer each extended-response question.

READ
INQUIRE
EXPLAIN

- 1** Reanne investigated the effect of temperature on cultures of bacteria. She found that as the temperature increased, so did the population of the bacteria.

PART A Why is the temperature the independent variable in the experiment and the bacteria population the dependent variable?

Temperature is the independent variable because Reanne changes it during the experiment. The size of the bacteria population is the dependent variable because it responds to the change in temperature.

PART B Why must other factors of the experiment remain constant?

All other factors should be held constant because if they are not, Reanne will not be able to say for sure that temperature was the variable that caused the response in population size.

FCAT TIPS

Keep Your Cool Stay focused during the test and don't rush, even if you notice that other students are finishing the test early.

List and Organize First For extended-response "Read, Inquire, Explain" questions, spend a few minutes listing and organizing the main points that you plan to discuss.

Keep Track of Time Allow about five minutes to answer short-response questions and about 10–15 minutes to answer extended-response questions.

READING TO LEARN SCIENCE

The strategies that you use to help you understand the material that you read depend on the purpose of your reading. For example, you do not read a textbook or questions on the FCAT the same way you read a novel. You read a textbook for information. You read a novel for fun. To get the most out of your reading, you need to choose the right strategy to fit the purpose of your reading.

USE READING AND SUCCEEDING TO HELP YOU:

- **identify new words and build your vocabulary.**
- **adjust the way you read to fit your reason for reading.**
- **use specific reading strategies to better understand what you read.**
- **use critical-thinking strategies to think more deeply about what you read.**

Identifying New Words and Building Vocabulary

What do you do when you come across a word you do not know as you read? Do you skip the word and keep reading? You might if you are reading for fun. But if you are reading for information, you might miss something important if you skip an unfamiliar word. When you come to a word you don't know, try the following strategies to figure out how to say the word and determine what the word means.

Sounding Out the Word

One way to figure out how to say a new word is to sound it out, syllable by syllable. Look carefully at the word's beginning, middle, and ending. Inside the word, do you see a word you already know how to pronounce? What vowels are in the syllables? Use the following tips when sounding out new words.

READING PRACTICE

- **What letters make up the beginning sound or beginning syllable of the word?**

In the word *coagulate*, *co* rhymes with *so*.

- **What sounds do the letters in the middle part of the word make?**

In the word *coagulate*, the syllable *ag* has the same sound as the *ag* in *bag*, and the syllable *u* is pronounced like the letter *u*.

- **What letters make up the ending sound or syllable?**

In the word *coagulate*, *late* is a familiar word you already know how to pronounce.

- **Now try pronouncing the whole word: *co ag u late*.**

- **Root and Base Words** The main part of a word is called its root. When the root is a complete word, it may be called the base word. For example, *bio*, meaning "life," is the root of *biology*, which is the study of life. *Atomic* is an adjective meaning "relating to atoms." It is composed of the base *atom* and the suffix *-ic*, which changes the base word from a noun into an adjective. When you see a new word, identify its root or base word. It can help you pronounce the word and figure out the word's meaning.
- **Prefixes** A prefix is a word part added to the beginning of a root or base word. For example, the prefix *micro-* means "small," so *microorganism* means "small organism." Prefixes can change, or even reverse, the meaning of a word. For example, *non-* means "not," so *nonvascular* means "not vascular."
- **Suffixes** A suffix is a word part added to the end of a root or base word to change the word's meaning. Adding a suffix to a word also can change that word from one part of speech to another. For example, the word *human*, which is a noun, becomes an adjective when the suffix *-oid* (meaning "form") is added. *Humanoid* means "human form."

Reading and Succeeding

Using Syntax

All languages have rules for the way words are arranged in sentences. The way a sentence is organized is called the syntax. In a simple English sentence, someone or something (the subject) does something (the predicate or verb) to or with another person or thing (the object). In the sentence “*The rabbit ate the grass*,” *rabbit* is the subject, *ate* is the verb, and *grass* is the object.

READING PRACTICE

The blizzy kwarkles sminched the flerky fleans.

At first glance, you might think you can’t determine anything about the meaning of this sentence. However, your experience with English syntax tells you that the action word, or verb, in this sentence is *sminched*.

- Who did the **sminching**? The **kwarkles**
- What kind of **kwarkles** were they? **Blizzy**
- Whom did they **sminch**? The **fleans**
- What kind of **fleans**? **Flerky**

Using Context Clues

You often can figure out the meaning of an unfamiliar word by looking at its context, that is, the words and sentences that surround it.

1. Look before and after the unfamiliar word for:
 - a definition or a synonym.
 - a general topic associated with the word.
 - a clue to what the word is similar to or different from.
 - an action or a description that has something to do with the word.
2. Connect what you already know with what the author has written.
3. Predict a possible meaning.
4. Use the meaning in the sentence.
5. Try again if your guess does not make sense.

Recognizing Word Meanings Across Subjects

Have you ever learned a new word in one class and then noticed it in your reading for other subjects? The word might not mean the same thing in each class. But you can use what you know about the word’s meaning to help you understand what it means in a different subject area.

READING PRACTICE

The meaning of the word *product* in one subject can help you understand its meaning in other subjects.

Social studies: Cotton cloth is one of the major products manufactured in the southern United States.

Math: After you multiply the two numbers, explain how you arrived at the product.

Science: One product of photosynthesis is oxygen.

Using Reference Materials

Dictionaries and other reference sources can help you learn new words.

- A **dictionary** gives the pronunciation and the meaning or meanings of words. A dictionary also might give other forms of words, their parts of speech, synonyms, and the historical backgrounds of words.
- A **glossary** is a word list that appears at the end, or in the appendix, of a book or other written work. It includes only words that appear in that work. Like dictionaries, glossaries can have the pronunciation and definitions of words.
- A **thesaurus** lists groups of words that have the same, or almost the same, meaning. Words with similar meanings are called synonyms.

Reading for a Reason

Why are you reading that paperback mystery? What do you hope to get from your science textbook? Do you read either of these books in the same way that you read a restaurant menu? How you read will depend on why you're reading.

Choosing Reading Materials

In school and in life, you will have many reasons for reading, and those reasons will lead you to a wide range of materials.

- **General Knowledge** To learn and understand new information, you might read news magazines, textbooks, news on the Internet, books about your favorite pastime, encyclopedia articles, primary and secondary sources for a school report, instructions on how to use a calling card, or directions for a standardized test.
- **Specific Information** To find specific information, you might read a Web page, a weather report, television listings, or the sports section of a newspaper.
- **Entertainment** To be entertained, you might read your favorite magazine, emails from friends, the Sunday comics, novels, or poems.

Adjusting How Fast You Read

How quickly or how carefully you should read something depends on your purpose for reading it. Think about your purpose and choose a strategy that works best.

- **Scanning** means quickly running your eyes over the material, looking for key words or phrases that point to the information you're looking for. For example, you might scan a newspaper for movie show times.
- **Skimming** means quickly reading to find the main idea. You might skim the sports section of the daily newspaper to find out how your favorite teams are doing. You might skim a chapter in your textbook to prepare for a test.
- **Careful reading** involves reading slowly and paying attention with a purpose in mind. Read carefully when you're learning new concepts, following complicated directions, or preparing to explain information to someone else.

Reading and Succeeding

Understanding What You Read

Try using some of the following strategies before, during, and after reading to understand and remember what you read.

Previewing

When you preview a piece of writing, you are looking for a general idea of what to expect from it. Before you read, try the following.

- **Look at the title** and any illustrations that are included.
- **Read the headings**, subheadings, and anything in bold letters.
- **Skim** over the passage to see how it is organized. Is it divided into many parts? Is it a long poem or short story?
- **Look at the graphics**—pictures, maps, or diagrams.
- **Set a purpose** for your reading. Are you reading to learn something new? Are you reading to find specific information?

Using What You Know

Believe it or not, you already know quite a bit about what you are going to read. Your own knowledge and personal experience can help you create meaning in what you read. Before you read, ask yourself: *What do I already know about this topic?*

Predicting

A prediction is a guess about what will happen. You do not need any special knowledge to make predictions when you read. The predictions do not even have to be accurate. Try making predictions before and during your reading about what might happen in the story or article you are reading.

Visualizing

Creating pictures in your mind about what you are reading—called *visualizing*—will help you understand and remember it. As you read, picture the setting—city streets, the desert, or the surface of the Moon. Visualizing what you read can help you remember it for a longer time.

Identifying Sequence

When you discover the logical order of events or ideas, you are identifying sequence. Look for clues and signal words that will help you find how information is organized.

Determining the Main Idea

When you look for the main idea of a selection, you look for the most important idea. The examples, reasons, and details that further explain the main idea are called *supporting details*.

Reading and Succeeding

Questioning

Ask yourself questions as you read. *Why is this important? How does one event relate to another? Do I understand what I just read?* Asking and answering questions helps you understand what you read.

Clarifying

As you read, you might find passages that you do not understand. Reread the passage using these techniques to help you clarify the passage's meaning.

- **Reread** the confusing parts slowly and carefully.
- **Look up** unfamiliar words.
- **"Talk out"** the passage to yourself.

Reviewing

When you review in school, you go over what you learned the day before so that the information is clear in your mind. Reviewing when you read does the same thing. Take time now and then to pause and review what you have read. Think about the main ideas and organize them for yourself so you can recall them later. Completing study aids such as graphic organizers can help you review.

Monitoring Your Comprehension

As you read, check your understanding by using the following strategies.

- **Summarize** When you read, pause from time to time and state the main ideas of what you have just read. Answer the questions *Who? What? Where? When? Why?* and *How?* Summarizing tests your comprehension because you state key points in your own words.
- **Paraphrase** Use paraphrasing to test whether you really got the point. Paraphrasing is retelling something in your own words. Try putting what you have just read into your own words. If you cannot explain it clearly, you probably should reread the text.

Thinking About Your Reading

Sometimes it is important to think more deeply about what you read so you can get the most out of what the author says. These critical thinking skills will help you go beyond what the words say and understand the meaning of your reading.

Interpreting

To interpret a text, first ask yourself: *What is the writer really saying here?* Then use what you know about the world to help answer that question.

Inferring

Writers sometimes suggest information or meaning without stating it directly. In reading, you infer when you use context clues and your own experience to figure out the author's meaning.

Reading and Succeeding

Drawing Conclusions

When you find connections between ideas and events, you are drawing conclusions. The process is like a detective solving a mystery. You combine information and evidence that the author provides to come up with a statement about the topic. This gives you a better understanding of what you are reading.

Analyzing

Analyzing, or looking at separate parts of something to understand the entire piece, is a way to think critically about written work. In analyzing informational text, you might look at how the ideas are organized to see what is most important.

Evaluating

When you form an opinion or make a judgment about something you are reading, you are evaluating. Ask yourself whether the author seems biased, whether the information is one-sided, and whether the argument presented is logical.

Synthesizing

When you synthesize, you combine ideas (maybe even from different sources) to come up with something new. For example, you might read a manual on coaching soccer, combine that information with your own experiences playing soccer, and come up with a winning plan for coaching your sister's team this spring.

Distinguishing Fact from Opinion

Distinguishing between fact and opinion is one of the most important reading skills you can learn. A fact is a statement that can be proved with supporting information. An opinion, on the other hand, is what a writer believes on the basis of his or her personal viewpoint.

As you examine information, always ask yourself, *Is this a fact or an opinion?* Opinions are important in many types of writing. You read editorials and essays for their authors' opinions. Reviews of books, movies, plays, and CDs can help you decide whether to spend your time and money on something. When opinions are based on faulty reasoning or prejudice, or when they are stated as facts, they become troublesome.

READING PRACTICE

Look at the following examples of fact and opinion.

Fact: Spiders are arachnids.

Opinion: Spiders are scary.

You could prove that spiders are arachnids; it is a fact. However, not everyone would agree that spiders are scary. That is someone's opinion.

Understanding Text Structure

Good writers structure each piece of their writing in a specific way for a specific purpose. That pattern of organization is called text structure. When you know the text structure of a selection, you will find it easier to locate and recall an author's ideas. Here are four ways that writers organize text.

Compare and Contrast

Compare-and-contrast structure shows the similarities and differences between people, things, and ideas. When writers use compare-and-contrast structure, often they want to show you *how things that seem alike are different* or *how things that seem different are alike*.

- **Signal words and phrases:** *similarly, on the other hand, in contrast to, however*

Cause and Effect

Just about everything that happens in life is the cause or the effect of some other event or action. Writers use cause-and-effect structure to explore the reasons for something happening and to examine the results of previous events. This structure helps answer the question that everybody is always asking: *Why?* Cause-and-effect structure is about explaining things.

- **Signal words and phrases:** *so, because, as a result, therefore*

Problem and Solution

How did scientists overcome the difficulty of getting a person to the Moon? How will I brush my teeth when I have forgotten my toothpaste? These questions might be very different in importance, but they have one thing in common: each identifies a problem and asks how to solve it. Problems and solutions are part of what makes science interesting. Problems and solutions also occur in fiction and nonfiction writing.

- **Signal words and phrases:** *how, help, problem, obstruction, difficulty, need, attempt, have to, must*

Sequence

Take a look at three common types of sequences, or the order in which thoughts are arranged.

1. **Chronological order** refers to the order in which events take place. First you wake up; next you have breakfast; then you go to school. Those events don't make much sense in any other order.

- **Signal words:** *first, next, then, later, finally*

2. **Spatial order** tells you the order in which to look at objects. For example, read this description of an ice cream sundae: *At the bottom of the dish are two scoops of vanilla ice cream. The scoops are covered with fudge and topped with whipped cream and a cherry.* Your eyes follow the sundae from the bottom to the top. Spatial order is important in writing because it helps you as a reader to see an image the way the author does.

- **Signal words:** *above, below, behind, next to*

3. **Order of importance** is going from most important to least important or the other way around. For example, a typical news article has a most-to-least-important structure.

- **Signal words:** *principal, central, important, fundamental*

Reading in the Science Classroom

Teaching science, much like the act of reading itself, is a complex process that incorporates a multitude of skills. Students come to the science classroom eager to learn, yet they sometimes flounder as they attempt to bridge the gap between reading the text and mastering the subject matter. Glencoe has provided a series of scientifically based reading strategies that enhance students' access to the text, no matter what their reading level. In the *Teacher Wraparound Edition*, each section of a chapter has the following reading components:

Reading Preview

Vocabulary is a key component of reading comprehension, especially in science. Many students acquire a superficial understanding of vocabulary terms but fail to grasp the complex associations, applications, or facets of the key concepts they represent. Research reveals that students must have multiple exposures to a word to comprehend its meaning, so Glencoe has provided activities and strategies in each section to guide teachers in helping students unlock vocabulary before they begin to read. By examining new vocabulary through structural analysis, activating prior knowledge, and/or explicit instruction, students will learn more than new words; they will learn strategies for future encounters with difficult vocabulary. Once students develop an understanding of scientific concepts through word study, they will be introduced to additional strategies during and after reading to fully incorporate the concept described by the word. Instructional techniques such as word charting, brainstorming, previewing, and setting a purpose for reading will ensure that students are prepared to comprehend the text.

Reading Strategy

Reading is constructing meaning from text. Teachers can help students construct meaning during reading by providing systematic instructional techniques that increase comprehension as students internalize strategies that hone their cognitive skills. Teachers and students will practice activities that build strong comprehension skills such as reciprocal teaching, paired reading, questioning the author, and class discussions. Students also will learn when and how to use graphic organizers, charts, and notes to summarize, categorize, and clarify. Students will learn to rely on such tools when comprehension breaks down. A combination of individualized activities, cooperative learning, and meaningful dialogue will provide the differentiated instruction necessary to meet the needs of each student.

Post Reading

Because reading is an active process, comprehension questions at the end of each chapter are not enough to ensure mastery of the content. Interactive projects in which students work together to gain deeper understanding, written responses that stimulate reflection, and extended learning based on interest, research and investigation will provide the practice and engagement students need to “own” the concepts provided by the text.

8-Step Process

The Florida Continuous Improvement Model: Implementing the 8-Step Instructional Process for *Florida Physical Science with Earth Science*

The Continuous Improvement Model provides a structure for improving student achievement. Its implementation in the science classroom can improve student mastery of the Sunshine State Standards and aid in student preparation for the FCAT.

The backbone of the Continuous Improvement Model is the 8-Step Process:

Disaggregate Data

Provide Tutorials for Non-Mastery Students

Develop Timeline and Instructional Focus Calendar

Provide Enrichments for Mastery Students

Deliver Focused Benchmark Lessons

Monitor Instructional Delivery

Administer Mini-Assessments of Benchmarks

Maintain Efficacy of the Process

The cyclical Plan-Do-Check-Act nature of the 8-Step Process provides continuous feedback and results data that can be used to determine the effectiveness of instruction and allow for modification as needed.

The following pages will describe how *Florida Physical Science with Earth Science* helps you work through each step.

8-Step Process

Disaggregate Data

Analyze Results

The foundation of the Continuous Improvement Model is the determination of student strengths and weaknesses at the beginning of the school year. With this information, a plan will be formulated to address student needs.

In addition to data provided by your district or the state, *Florida Physical Science with Earth Science* offers these data collection tools:

ExamView® Pro Testmaker CD-ROM

- Contains editable pretests for each chapter
- Allows you to build Benchmark-specific tests
- Provides disaggregated data by student or Benchmark when students test online

Succeeding on the FCAT CD-ROM

- Allows students to practice by Benchmark
- Generates data reports by Benchmark for the class and for individual students
- Allows the teacher to set a mastery threshold
- Generates NCLB data and reports

Mastering the FCAT

- Offers an additional pretest that can be taken with paper and pencil or edited and taken online through *ExamView® Pro*
- Contains a Student Tracking Chart to record student progress

8-Step Process

Develop Timeline and Instructional Focus Calendar

Make a Plan

Once student needs are determined, it's time to plan. Typically, a district or school time line will be developed based on this step. Once such an overall strategy is in place, you can plan your focused lesson instruction.

Pacing Guide

The Pacing Guide on pages FL29–FL41 is a sequence of single-session classes for teaching the *Student Edition* to cover all in-depth Benchmarks. This guide also includes scheduling for block classes. Both schedules allow time for review and practice.

Chapter 13 Electricity								
45-minute period								
Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7 & 8	Day 9	
Launch LAB Section 13.1	MiniLAB Section 13.2	Section 13.2 MiniLAB	Section 13.2	LAB (1-p)	Section 13.3	LAB (2-p)	Chapter Review Standardized Test Practice	
90-minute period								
Day 1	Day 2	Day 3	Day 4	Day 5				
Launch LAB Section 13.1	Section 13.2 MiniLAB	LAB (1-p) Section 13.3	LAB (2-p)	Chapter Review Standardized Test Practice				

TeacherWorks™ CD-ROM

- Lists Benchmarks for each chapter and section
- Contains Interactive Teacher Edition
- Provides editable *Florida Planning Guide for Continuous Improvement* with Benchmark correlations and a list of all teaching resources. Pick and choose what you need when you need it.
- Each lesson is available for three ability levels—L1, L2, and L3.

8-Step Process

Deliver Focused Benchmarks Lessons

Teach the Lesson

With your teaching plan developed, you are ready to focus on lessons that are structured around the Sunshine State Standards. Lessons should concentrate on covering required Benchmarks, some FCAT focus, and meeting students' needs.

Interactive Chalkboard™ CD-ROM

- Includes editable Microsoft® PowerPoint® presentations for each section of every chapter
- Contains animations with audio
- Provides an extensive image bank

Florida Physical Science with Earth Science Student Edition

- Lists all Benchmarks covered within each chapter and section
- Provides correlations to Benchmarks for assessment questions

Florida Physical Science with Earth Science Teacher Wraparound Edition

- Includes correlations to Sunshine State Standards, Mathematics
- Shows chapter components at a glance on the Chapter Organizer pages at the beginning of each chapter

End of Chapter Assessment		
Backline Masters	Technology	Professional Series

8-Step Process

Differentiated Instruction

The following resources provide materials for use with diverse student needs.

Florida Physical Science with Earth Science Teacher Wraparound Edition

- Each chapter's Resource Manager pages show reduced worksheets and transparencies, including options for reading and mathematics support. The following labels are used to help you decide which activities are appropriate for your students:

-  appropriate for students with learning difficulties
-  within the ability range of all students
-  designed for students who have mastered the content

- Features in the margins of the *Teacher Wraparound Edition* are labeled with the above learning levels and the following:

-  appropriate for English-language learners
-  designed for a small group
-  strategies that address different learning styles
-  students produce work appropriate for their portfolios

StudentWorks™ Plus CD-ROM

- StudentWorks™ Plus* is ideal for auditory learners, English-language learners, or reluctant readers. It combines the *Student Edition* on CD-ROM with a full audio reading of the text in English so that students can simultaneously read and listen to the book. It also includes Spanish and Haitian Creole summaries of each chapter, as well as animations with audio.

Reading Essentials for Florida Physical Science with Earth Science

- This workbook contains the content of the *Student Edition* written at a reading level two to three grades lower than the *Student Edition*. It is appropriate for struggling readers and ELL students. To make the content accessible to all learners, it includes additional reading strategies and extra *Foldables™* projects.

Additional Components

- Dinah Zike's *Foldables™* are found in each chapter and provide a kinesthetic study organizer that students can use throughout the chapter.
- The Glencoe Professional Series component *ELL Strategies for Science* helps meet the needs of English-language learners.
- At fl.gpescience.com, you will find a multilingual science glossary that lists key science terms in English, Spanish, Haitian Creole, and seven other languages. You also will find tools for differentiation including an Interactive Tutor, Vocabulary PuzzleMaker, and WebQuests.
- Virtual Labs provide application and enrichment opportunities for students as interactive simulations.

8-Step Process

Administer Mini-Assessments of Benchmarks

Check Progress

Assessment is the heart of the Florida Continuous Improvement Model. Assessments will tell you how successful your instruction was and what adjustments need to be made. Using different assessment techniques will help you meet the diverse learning styles of your students.

Assessment		
	Student Edition	Technology and Online Resources
Section	Reading Checks throughout the text assess student comprehension.	More Section Review at fl.gpscience.com provides additional section questions.
	Section Reviews provide questions of different ability levels.	Unique section assessment questions correlated to Benchmarks follow each <i>Interactive Chalkboard™</i> presentation.
Chapter	Chapter Review pages include Using Vocabulary, Checking Concepts, Interpreting Graphics, and Applying Math assessments. Benchmark correlations are given.	Chapter Review at fl.gpscience.com provides additional chapter questions.
		<i>ExamView® Pro Testmaker</i> CD-ROM enables test generation by chapter or Benchmark.
		<i>TeacherWorks™</i> CD-ROM contains transparencies, including <i>Chapter Review</i> , <i>Chapter Test</i> , and <i>Assessment</i> , and worksheets for each chapter.
FCAT	Each chapter ends with two pages of Standardized Test Practice . These questions are written in all four FCAT formats and are correlated to Benchmarks.	Standardized Test Practice at fl.gpscience.com provides additional questions.
		<i>ExamView® Pro Testmaker</i> CD-ROM includes a pretest, posttest, and practice questions for each Benchmark. These questions come from <i>Mastering the FCAT</i> .
		<i>TeacherWorks™</i> CD-ROM contains the <i>FCAT Transparencies</i> book. There are two transparencies for each assessed Benchmark.
		<i>Succeeding on the FCAT</i> CD-ROM is a Benchmark-driven tutorial that can provide student feedback and teacher data.

8-Step Process

Provide Tutorials for Non-Mastery Students

Provide Practice

Assessment and daily observations will help you identify students who need additional help mastering the Sunshine State Standards. The following resources will help you meet students' needs.

Tutorials for Reading and Science Skills

Teacher Classroom Resources

Reading Essentials for Florida Physical Science with Earth Science—a key resource for struggling and reluctant readers. Reading level is two to three grade levels below the *Student Edition*.

Chapter Resources

- Note-taking Worksheets—content outlines students can complete
- Directed Reading for Content Mastery (English and Spanish)—consists of an overview page, two pages of review by section, and a key terms page
- Reinforcement worksheets—review chapter content
- Teaching Transparency Activity—black and white copy of teaching transparency with worksheet for students to complete

Mathematics Skills Activities—allows students to practice mathematics skills while reinforcing science concepts; correlated to the Sunshine State Standards, Mathematics in the *Teacher Wraparound Edition*.

Reading and Writing Skills Activities—offers science-based reading and writing activities; models FCAT formats; correlated to the Sunshine State Standards, Language Arts

Science Notebook—presents a step-by-step approach to improving student note-taking ability with strategies based on the Cornell note-taking model; builds scientific and academic vocabulary skills, scientific writing skills, and ability in reading for critical content; uses Bloom's Hierarchy of Learning to indicate strategy levels

Study Guide and Reinforcement—includes worksheets and study tools for each section

Performance Assessment in the Science Classroom—contains rubrics and assessment-task checklists

Technology

Succeeding on the FCAT CD-ROM—Benchmark-based tutorials

StudentWorks™ Plus CD-ROM—combines the *Student Edition* on CD-ROM with full audio reading of the text in English and chapter summaries in Spanish and Haitian Creole; contains student worksheets, *Reading Essentials for Florida Physical Science with Earth Science*, and *Laboratory Activities Manual*

Video Labs—for student review, absent students, and students who have difficulty with labs; one lab per chapter; DVD and VHS

fl.gpescience.com

Standardized Test Practice—quizzes correlated to the Sunshine State Standards

Vocabulary PuzzleMaker—word searches, games, and crossword puzzles

8-Step Process

Provide Enrichment for Mastery Students

Provide Enrichment

Students who master content will benefit from challenging, hands-on investigations that can be done in the classroom or a computer lab.

Teacher Classroom Resources

Differentiated Instruction, Challenge activities—in-depth strategies in the *Teacher Wraparound Edition* for mastery students

Enrichment Worksheets—activities in *Chapter Resources* that extend chapter topics or explore related topics

Science Inquiry Lab Manual—open-ended activities that develop critical-thinking in science

Probeware Lab Manual—labs that use a probe or sensor to collect data

Cultural Diversity—activities that put scientific achievements in a multicultural context

Earth Science Critical Thinking/Problem Solving, *Physical Science Critical*

Thinking/Problem Solving—two resources that help students develop higher-order thinking skills in science

Study Guide and Reinforcement—includes worksheets and study tools for each section

Performance Assessment in the Science Classroom—contains rubrics and assessment-task checklists

Technology

Virtual Labs CD-ROM—interactive lab simulations

StudentWorks™ Plus CD-ROM—combines the Interactive *Teacher Wraparound Edition*, planning tools, and electronic versions of print resources

fl.gpescience.com

Standardized Test Practice—quizzes correlated to the Sunshine State Standards

8-Step Process

Monitor Instructional Delivery

Demonstrate Performance

School leadership support and monitoring is an integral part of the 8-Step Process. *Florida Physical Science with Earth Science* provides options to track your Benchmark coverage.

TeacherWorks™ CD-ROM

- create printable lesson plans with Benchmark correlations and resources
- customize lessons to align with various capabilities and skill levels of your students

Florida Planning Guide for Continuous Improvement

- focuses on ways teachers can intervene to help struggling students improve their performance
- contains Academic Improvement Plan, a daily assignment document that can be used to reflect and identify additional modified lessons for the diverse needs of students
- includes Monitor Benchmark Progress chart, a weekly Benchmark proficiency document that provides a quick solution for each achievement level
- includes Maintenance Progress chart, a weekly Benchmark review and evaluation document that records periodic reviews of each Sunshine State Standard and illustrates your Benchmark review progress
- editable version of this guide also available on *TeacherWorks™* CD-ROM

Science YES

- professional development modules that provide additional content support for key science concepts

Curriculum Mapping for Florida Physical Science with Earth Science

- incorporates the 8-Step Continuous Improvement Plan to prepare your students for the FCAT
- correlates each Sunshine State Standard to all available Glencoe middle school print and technology materials
- utilizes a scaffolding content approach to ensure that Benchmarks are reinforced throughout middle school

8-Step Process

Maintain Efficacy of the Process

Help Students Retain Knowledge

Once students have mastered a skill, it is important that they retain what they have learned. Reinforcement should be an integral part of daily lesson plans. The *Florida Physical Science with Earth Science* program offers many options for skill and content reinforcement.

Science Skills

MindJogger Videoquizzes

- game show format to help students review every main idea and key term in the textbook
- VHS and DVD

ExamView™ Pro Testmaker CD-ROM

- includes questions from *Mastering the FCAT* test prep book
- contains a pretest, posttest, and practice questions in FCAT formats for each Benchmark

Interactive Tutor at fl.gpescience.com

- vocabulary-based word searches, puzzles, and games
- one per chapter

FCAT Skills

Mastering the FCAT

- provides Benchmark-based practice questions in FCAT formats
- includes student recording chart

Succeeding on the FCAT CD-ROM

- Benchmark-based tutorial

FCAT Transparencies

- two transparencies for each Benchmark
- can be used for pretests or posttests

Standardized Test Practice at fl.gpescience.com

- quizzes correlated to the Sunshine State Standards

Pacing Guide

Pacing Guide for Integrated Science I to *Florida Physical Science with Earth Science*

The pacing guide for Integrated Science I to *Physical Science with Earth Science* will allow you to concentrate on the Sunshine State Standards assessed on the grade 11 FCAT. Items that cover Sunshine State Standards and Benchmarks are in red.

Guide to FCAT Success

Sunshine State Standards Science Grades 9–12

correlated to

Florida Physical Science with Earth Science

Bold page numbers indicate in-depth coverage of Benchmark.

Strand A: The Nature of Matter

Standard 1: The student understands that all matter has observable, measurable properties. (SC.A.1.4)

Benchmark(s)	Page(s)
1. The student knows that the electron configuration in atoms determines how a substance reacts and how much energy is involved in its reactions.	594, 694–700
2. The student knows that the vast diversity of the properties of materials is primarily due to variations in the forces that hold molecules together.	254, 260–261 , 357, 371, 373–375, 610–614 , 694–700 , 768–769
3. The student knows that a change from one phase of matter to another involves a gain or loss of energy.	261–263 , 371–373, 618, 622, 630, 741–743 , 762
4. The student experiments and determines that the rates of reaction among atoms and molecules depend on the concentration, pressure, and temperature of the reactants and the presence or absence of catalysts.	520, 612 , 631 , 633, 763
5. The student knows that connections (bonds) form between substances when outer-shell electrons are either transferred or shared between their atoms, changing the properties of substances.	594, 610–611, 689 , 693 , 694–700

Standard 2: The student understands the basic principles of atomic theory. (SC.A.2.4)

1. The student knows that the number and configuration of electrons will equal the number of protons in an electrically neutral atom and when an atom gains or loses electrons, the charge is unbalanced.	592, 694–696 , 710–711 , 786
2. The student knows the difference between an element, a molecule, and a compound.	552–554 , 608–609 , 697, 701
3. The student knows that a number of elements have heavier, unstable nuclei that decay, spontaneously giving off smaller particles and waves that result in a small loss of mass and release a large amount of energy.	652 , 788–789 , 790, 791–805 , 808–809
4. The student knows that nuclear energy is released when small, light atoms are fused into heavier ones.	803
5. The student knows that elements are arranged into groups and families based on similarities in electron structure and that their physical and chemical properties can be predicted.	592–593 , 693 , 701–702, 710–711
6. The student understands that matter may act as a wave, a particle, or something else entirely different with its own characteristic behavior.	460–461

Guide to FCAT Success

Bold page numbers indicate in-depth coverage of Benchmark.

Strand B: Energy

Standard 1: The student recognizes that energy may be changed in form with varying efficiency. (SC.B.1.4)

Benchmark(s)	Page(s)
1. The student understands how knowledge of energy is fundamental to all the scientific disciplines (e.g., the energy required for biological processes in living organisms and the energy required for the building, erosion, and rebuilding of the Earth).	128, 129, 131, 142–143, 293, 522, 530, 734–740
2. The student understands that there is conservation of mass and energy when matter is transformed.	139–141, 567, 634–635, 721–722, 789, 802
3. The student knows that temperature is a measure of the average translational kinetic energy of motion of the molecules in an object.	133, 254–256
4. The student knows that as electrical charges oscillate, they create time-varying electric and magnetic fields that propagate away from the source as an electromagnetic wave.	456–461, 612
5. The student knows that each source of energy presents advantages and disadvantages to its use in society (e.g., political and economic implications may determine a society's selection of renewable or nonrenewable energy sources).	487, 492, 497–500, 502–505, 508–509
6. The student knows that the first law of thermodynamics relates the transfer of energy to the work done and the heat transferred.	276
7. The student knows that the total amount of usable energy always decreases, even though the total amount of energy is conserved in any transfer.	163–165, 179, 181, 277, 279

Standard 2: The student understands the interaction of matter and energy. (SC.B.2.4)

- | | |
|--|------------------------------------|
| 1. The student knows that the structure of the universe is the result of interactions involving fundamental particles (matter) and basic forces (energy) and that evidence suggests that the universe contains all of the matter and energy that ever existed. | 372, 789, 803, 836–837, 839 |
|--|------------------------------------|

Guide to FCAT Success

Bold page numbers indicate in-depth coverage of Benchmark.

Strand C: Force and Motion

Standard 1: The student understands that types of motion may be described, measured, and predicted. (SC.C.1.4)

Benchmark(s)	Page(s)
1. The student knows that all motion is relative to whatever frame of reference is chosen and that there is no absolute frame of reference from which to observe all motion.	70–71
2. The student knows that any change in velocity is an acceleration.	76–80 , 101

Standard 2: The student understands that the types of force that act on an object and the effect of that force can be described, measured, and predicted. (SC.C.2.4)

1. The student knows that acceleration due to gravitational force is proportional to mass and inversely proportional to the square of the distance between the objects.	104–105
2. The student knows that electrical forces exist between any two charged objects.	256, 260, 345–392, 393–394 , 395–396, 398–399 , 420–421, 690
3. The student describes how magnetic force and electrical force are two aspects of a single force.	439
4. The student knows that the forces that hold the nucleus of an atom together are much stronger than electromagnetic force and that this is the reason for the great amount of energy released from the nuclear reactions in the sun and other stars.	104, 787, 789, 803
5. The student knows that most observable forces can be traced to electric forces acting between atoms or molecules.	394
6. The student explains that all forces come in pairs commonly called action and reaction.	113–115

Strand D: Processes that Shape the Earth

Standard 1: The student recognizes that processes in the lithosphere, atmosphere, hydrosphere, and biosphere interact to shape the Earth. (SC.D.1.4)

1. The student knows how climatic patterns on Earth result from an interplay of many factors (Earth's topography, its rotation on its axis, solar radiation, the transfer of heat energy where the atmosphere interfaces with lands and oceans, and wind and ocean currents).	268–269 , 525–527 , 535–536
2. The student knows that the solid crust of Earth consists of slow-moving, separate plates that float on a denser, molten layer of Earth and that these plates interact with each other, changing the Earth's surface in many ways (e.g., forming mountain ranges and rift valleys, causing earthquake and volcanic activity, and forming undersea mountains that can become ocean islands).	82, 293, 354–361 , 376, 674–675
3. The student knows that changes in Earth's climate, geological activity, and life forms may be traced and compared.	530 , 535–538 , 586, 668, 669–671
4. The student knows that Earth's systems and organisms are the result of a long, continuous change over time.	354–361 , 372, 529, 535–536 , 566, 669 , 672

Guide to FCAT Success

Bold page numbers indicate in-depth coverage of Benchmark.

Standard 2: The student understands the need for protection of the natural systems on Earth. (SC.D.2.4)

Benchmark(s)	Page(s)
1. The student understands the interconnectedness of the systems on Earth and the quality of life.	529–530 , 778

Strand E: Earth and Space

Standard 1: The student understands the interaction and organization in the Solar System and the universe and how this affects life on Earth. (SC.E.1.4)

1. The student understands the relationships between events on Earth and the movements of the Earth, its moon, the other planets, and the sun.	110–111 , 120 , 190–195 , 197–198 , 218–221 , 222, 536
2. The student knows how the characteristics of other planets and satellites are similar to and different from those of the Earth.	189 , 224 , 226, 230, 231, 239–240 , 372
3. The student knows the various reasons that Earth is the only planet in our Solar System that appears to be capable of supporting life as we know it.	189, 238–239

Standard 2: The student recognizes the vastness of the universe and the Earth's place in it. (SC.E.2.4)

1. The student knows that the stages in the development of three categories of stars are based on mass: stars that have the approximate mass of our sun, stars that are two-to-three-stellar masses and develop into neutron stars, and stars that are five-to-six-stellar masses and develop into black holes.	824–828
2. The student identifies the arrangement of bodies found within and outside our galaxy.	831–833 , 837–838
3. The student knows astronomical distance and time.	187, 191–192 , 197 , 199 , 220, 820
4. The student understands stellar equilibrium.	824–828 , 830
5. The student knows various scientific theories on how the universe was formed.	836–837
6. The student knows the various ways in which scientists collect and generate data about our universe (e.g., X-ray telescopes, computer simulations of gravitational systems, nuclear reactions, space probes, and supercollider simulations).	204–206 , 223–228 , 231–235 , 241, 580, 831–835
7. The student knows that mathematical models and computer simulations are used in studying evidence from many sources to form a scientific account of the universe.	454, 472, 838–840

Guide to FCAT Success

Bold page numbers indicate in-depth coverage of Benchmark.

Strand F: Processes of Life

Standard 1: The student describes patterns of structure and function in living things. (SC.F.1.4)

Benchmark(s)	Page(s)
2. The student knows that body structures are uniquely designed and adapted for their function.	168, 335 , 340–343
4. The student understands that biological systems obey the same laws of conservation as physical systems.	142
6. The student knows that separate parts of the body communicate with each other using electrical and/or chemical signals.	335, 340

Standard 2: The student understands the process and importance of genetic diversity. (SC.F.2.4)

3. The student understands the mechanisms of change (e.g., mutation and natural selection) that lead to adaptations in a species and their ability to survive naturally in changing conditions and to increase species diversity.	238–239 , 530–531
---	---------------------------------

Strand G: How Living Things Interact with Their Environment

Standard 1: The student understands the competitive, interdependent, cyclic nature of living things in the environment. (SC.G.1.4)

1. The student knows of the great diversity and interdependence of living things.	531, 778
2. The student understands how the flow of energy through an ecosystem made up of producers, consumers, and decomposers carries out the processes of life and that some energy dissipates as heat and is not recycled.	139, 151, 536
3. The student knows that the chemical elements that make up the molecules of living things are combined and recombined in different ways.	522, 536

Standard 2: The student understands the consequences of using limited natural resources. (SC.G.2.4)

1. The student knows that layers of energy-rich organic materials have been gradually turned into great coal beds and oil pools (fossil fuels) by the pressure of the overlying earth and that humans burn fossil fuels to release the stored energy as heat and carbon dioxide.	487–493
2. The student knows that changes in a component of an ecosystem will have unpredictable effects on the entire system but that the components of the system tend to react in a way that will restore the ecosystem to its original condition.	652, 663
4. The student knows that the world ecosystems are shaped by physical factors that limit their productivity.	651 , 661

Guide to FCAT Success

FCAT FOCUS

Bold page numbers indicate in-depth coverage of Benchmark.

Strand H: The Nature of Science

Standard 1: The student uses the scientific processes and habits of mind to solve problems. (SC.H.1.4)

Benchmark(s)	Page(s)
1. The student knows that investigations are conducted to explore new phenomena, to check on previous results, to test how well a theory predicts, and to compare different theories.	7, 87–89 , 105 , 112 , 118–120 , 146, 175, 206–207 , 227, 235, 236–239 , 271 , 278–279 , 300 , 310–311, 354–361 , 391, 406, 415 , 419, 460–461 , 468, 507 , 538, 633 , 801 , 837
2. The student knows that from time to time, major shifts occur in the scientific view of how the world works, but that more often the changes that take place in the body of scientific knowledge are small modifications of prior knowledge.	7, 105 , 120 , 218–221 , 225, 354–361 , 370–372 , 460–461 , 478 , 538, 581, 801 , 836–837
3. The student understands that no matter how well one theory fits observations, a new theory might fit them as well or better, or might fit a wider range of observations, because in science, the testing, revising, and occasional discarding of theories, new and old, never ends and leads to an increasingly better understanding of how things work in the world, but not to absolute truth.	12, 120 , 206–207 , 240–241 , 354–361 , 460–461 , 478 , 580, 801 , 839
4. The student knows that scientists in any one research group tend to see things alike and that therefore scientific teams are expected to seek out the possible sources of bias in the design of their investigations and in their data analysis.	10 , 87, 89, 112, 119, 175, 229, 468, 538
5. The student understands that new ideas in science are limited by the context in which they are conceived, are often rejected by the scientific establishment, sometimes spring from unexpected findings, and usually grow slowly from many contributors.	7, 12, 120 , 219–221 , 240, 312, 538, 669, 801
6. The student understands that, in the short run, new ideas that do not mesh well with mainstream ideas in science often encounter vigorous criticism and that, in the long run, theories are judged by how they fit with other theories, the range of observations they explain, how well they explain observations, and how effective they are in predicting new findings.	12, 105 , 120 , 146, 219–220 , 354–361 , 370–372 , 478
7. The student understands the importance of a sense of responsibility, a commitment to peer review, truthful reporting of the methods and outcomes of investigations, and making the public aware of the findings.	10, 87, 89, 105 , 112, 119, 134, 145, 175, 177–178, 271, 300, 311, 391, 406, 415, 468, 477, 507, 509, 809

Standard 2: The student understands that most natural events occur in comprehensible, consistent patterns. (SC.H.2.4)

1. The student knows that scientists assume that the universe is a vast system in which basic rules exist that may range from very simple to extremely complex, but that scientists operate on the belief that the rules can be discovered by careful, systemic study.	6, 105 , 112, 119, 120 , 218–220 , 310–311, 354–361 , 406, 460–461 , 529–530 , 538 , 835–838
2. The student knows that scientists control conditions in order to obtain evidence, but when that is not possible for practical or ethical reasons, they try to observe a wide range of natural occurrences to discern patterns.	8–9 , 77, 89, 112, 119, 134, 144–145, 279, 310–311, 507, 537 , 608, 634–635 , 837–839

Guide to FCAT Success

Bold page numbers indicate in-depth coverage of Benchmark.

Strand H: The Nature of Science

Standard 3: The student understands that science, technology, and society are interwoven and interdependent. (SC.H.3.4)

Benchmark(s)	Page(s)
1. The student knows that performance testing is often conducted using small-scale models, computer simulations, or analogous systems to reduce the chance of system failure.	55–56, 112, 176, 271, 468, 616, 636–637
2. The student knows that technological problems often create a demand for new scientific knowledge and that new technologies make it possible for scientists to extend their research in a way that advances science.	52–57, 77, 178, 238, 239, 312, 464
3. The student knows that scientists can bring information, insights, and analytical skills to matters of public concern and help people understand the possible causes and effects of events.	39, 275, 312, 510, 537–538, 806
4. The student knows that funds for science research come from federal government agencies, industry, and private foundations and that this funding often influences the areas of discovery.	46–47, 312, 370
5. The student knows that the value of a technology may differ for different people and at different times.	42–44, 153, 167, 176, 312, 415, 463–465, 467, 472–475, 499, 502, 504, 508–510, 614–615, 792, 794, 806
6. The student knows that scientific knowledge is used by those who engage in design and technology to solve practical problems, taking human values and limitations into account.	38–45, 89, 112, 176, 264, 270, 276, 312, 414, 463–465, 467, 498, 538, 638, 806

Teacher Advisory Board

Glencoe's National Teacher Advisory Board gave the authors, editorial staff, and the design team feedback on the content and design of the Student Edition. They were instrumental in providing valuable input toward the development of the 2006 edition of *Glencoe Physical Science with Earth Science*. We thank these teachers for their hard work and creative suggestions.

Dynamic Instruction

The consistent instructional strategies in each chapter strengthen students' learning—from the beginning of each chapter where students see "Chapter Preview," to the end where they have a chance to test the knowledge they have acquired and prepare for the next lesson.

Chapter Preview

at the beginning of each chapter introduces the main concepts.

Science Journal

promotes writing and critical-thinking skills.

Dinah Zike's Foldables™

let students create interactive study guides.

Launch Lab

gives students an opportunity to explore new ideas at the beginning of the chapter.

What You'll Learn at the beginning of each section introduces the main concepts.

Why It's Important provides an answer to "Why do we have to learn this?"

Reading Guide

What You'll Learn

- Compare and contrast Earth's physical characteristics with those of other planets.
- Explain Earth's magnetic field.
- Describe Earth's movement in space and how eclipses occur.

Why It's Important

Gravity from the Earth-Moon-Sun system directly affects what it's like to live here on Earth.

Review Vocabulary

orbit: curved path of one object, such as the Moon, around another object, such as Earth

New Vocabulary

- sphere
- gravity
- ellipse

Review Vocabulary reviews a term that helps students better understand section content.

New Vocabulary highlights new terms students will learn in the section.

Labs Whether students are designing their own experiments or following well-tested procedures, they'll learn and practice science processes.

MiniLABs offer students quick and easy-to-do ways to clarify concepts and reinforce skills.

LAB

Model and Invent

Care Package

Goal

- Model packaging and shipping a product for consumer interest
- Calculate the cost to produce a consumer product.
- Test your packaging design to see if it keeps the snacks from being damaged.

Possible Materials

shoe box
assorted snack foods
packing peanuts
shredded newspaper
packing tape
wrapping paper
markers

Safety Precautions

Real-World Problem

Suppose you are a young business owner. You have decided to start a snack business. You need to design a package for your product. The package must be attractive, easy to use, and keep your costs to a minimum.

Make a Model

1. Choose the snack items that you would like to include in your care package.
2. Plan how you are going to pack your items so that they are not damaged and are easy to ship.
3. Design your package. Use the materials provided to create a model of your package. Be sure to include a label that describes your product.
4. Test your package. Pack your snacks in your package. Shake the package to see if the snacks are damaged.
5. Present your package to the class. Explain your design and how you kept your costs to a minimum.
6. Make a final presentation of your package.

Investigating Charged Objects

Procedure

1. Fold over about 1 cm on the end of a roll of transparent tape to make a handle. Tear off a strip of tape about 10 cm long.
2. Stick the strip to a clean, dry, smooth surface, such as a countertop. Make another identical strip and stick it directly on top of the first.
3. Pull both pieces off the counter together and pull them apart. Then bring the nonsticky sides of both tapes together. What happens? Now stick the two strips of tape side by side on the smooth surface. Pull them off and bring the nonsticky sides near each other again.

Analysis

1. What happened when you brought the pieces close together the first time? Were they charged alike or opposite? What might have caused this?
2. What did you observe when you brought the pieces together the second time? How were they charged? What did you do differently that might have changed the behavior?

Detecting

The pieces of tape are charged with static electricity. The leaves of the electroscope are attracted to the charged tape. This is because the leaves are made of metal, and metal is a conductor of electricity. When the charged tape is brought near the leaves, the leaves become charged with the same type of charge as the tape. Like charges repel each other, so the leaves move apart.

Figure 10A.

Suppose the metal is the leaves of the electroscope. The leaves are charged with the same type of charge as the tape. Like charges repel each other, so the leaves move apart.

TRY IT HOME

Multilevel Review and Assessment

Each chapter provides five pages of review and testing to help you evaluate students' knowledge and ability to apply science concepts.

Section Review

- Summary pinpoints important concepts in the section.
- Skill-based questions promote critical thinking skills.

Study Guide

- Main idea summary of each section
- Concept mapping activity to help students visualize the main ideas

Chapter Review

- Using Vocabulary
- Checking Concepts
- Thinking Critically
- Performance Activities
- Applying Math

Standardized Test Practice

- Multiple Choice
- Gridded Response
- Short Response
- Extended Response

Time-Saving Teacher Resources

Glencoe Science provides an extensive array of support materials and resources designed to help you create and customize your science course quickly and easily.

FAST FILE Chapter Resources

For each chapter, Chapter Resources contain key reproducible masters along with additional teaching strategies, teacher support, and answer keys.

Reproducible Student Resources include:

- Worksheets for all MiniLABs and Labs
- *Directed Reading for Content Mastery* (in English and Spanish), *Reinforcement* and *Enrichment* worksheets for each chapter
- *Section Focus, Teaching, and Assessment Transparencies* masters
- Chapter Review and Chapter Test masters

Teacher Support and Planning includes:

- Additional student preparation materials for each chapter
- Spanish Resources provide translations of all objectives, vocabulary, and main ideas
- Answer keys and teaching strategies

Teacher Works™

This CD-ROM is your all-in-one teacher resource center. Personalize a lesson plan, access resources from the *Teacher Wraparound Edition*, connect to the Internet, or make a to-do list. These are only a few of the many features that can assist you in the planning and organizing of your lessons.

Includes:

- A calendar feature
- Access to all program blackline masters
- Standards correlations and more

Teacher Wraparound Edition

The *Teacher Wraparound Edition* is your key to the teaching resources available. In addition to teaching strategies and suggestions, the *Teacher Wraparound Edition* provides a guide for all print and software materials available for each lesson.

Transparencies

- Section Focus Transparency
- Assessment Transparency
- Teaching Transparency
- Transparency masters and worksheets

ExamView® Pro Testmaker CD-ROM

- Create, edit, and customize tests
- Create multiple versions of tests
- Translate tests from English to Spanish and vice versa
- Build tests aligned with state standards

Video Labs

- Step-by-step lab procedures for selected *Student Edition* labs
- Lab safety skills
- Teacher support
- Troubleshooting advice

Technology Support

Student Works *Plus*

This CD-ROM is a valuable resource for students to access content online and use online resources to continue learning chapter concepts.

Includes:

- Complete *Student Edition* on CD-ROM
- Full read of *Student Edition* in English and summaries of each chapter in Spanish and Haitian Creole
- Links to online activities and resources
- Access to all student worksheets

This CD-ROM brings Microsoft® PowerPoint® presentations right to your door. With the large number

of graphics provided, students can use a visual approach to learning chapter content.

Includes:

- A pre-made presentation for every chapter
- Image bank and interactive graphics
- Animations and audio clips
- All new section and chapter questions
- Standardized test practice
- Transparencies
- Foldables™ directions
- Links to fl.gpscience.com

Using TechCONNECT, your students develop computer skills as they reinforce basic language arts, math, science, and social studies concepts. TechCONNECT provides a solution for incorporating technology in the classroom, as states and districts fulfill *No Child Left Behind* (NCLB) requirements. This legislation sets the goal that “every student be technologically literate by the time the student finishes the eighth grade” and requires that states “improve the capacity to integrate technology into their curriculum and instruction.”

Visit the Web site for a FREE tour—
techconnect.glencoe.com

Virtual Labs CD-ROM Program

The *Virtual Labs* CD-ROM contains a collection of labs that allow students to complete labs that are too expensive, take too long to complete, or might be too dangerous in a classroom laboratory.

Science online

fl.gpscience.com

For students:

- Prescreened Internet sites (Web links) that correlate to text chapters
- Interactive activities that review chapter concepts
- Internet Labs where students can share data with each other
- Access to *Student Edition* online
- Interactive self-check quizzes for each chapter section as well as the entire chapter

For teachers:

- *WebQuest* activities
- Teacher Forum for teachers to share activities and ideas

mhl.com is an online teaching and learning space for teachers, students, and parents.

- For students, mhl.com provides an interactive online textbook. This means a lighter student backpack.
- For teachers, mhl.com provides a customizable online learning space for posting assignments, web-based instruction, student resources, and a class calendar.
- For parents, mhl.com provides tools to help their child succeed in school. Parents have instant access to their child's progress and daily assignments.

Help Your Students with Reading and Writing

Glencoe Science increases science literacy, improves reading comprehension, and deepens students' understanding of ideas and concepts. The reading strategies are active, constructive, and engaging.

In the Student Edition

Reading Checks stimulate quick recall and keep students focused on the main idea.

Caption Questions offer a visual approach to learning. Students are asked to recall what they have read by interpreting the visual.

Figure 18 Three allotropes of carbon are depicted here.

Identify the geometric shapes that make up each allotrope.

Science Journals provide opportunities to write responses to questions that require critical thinking, to conduct research and write about it, or to practice creative writing skills.

Skill Words such as *compare and contrast*, *describe*, *explain*, and *state* are included in the Self Check at the end of each section, in the goals of each Lab, and in the chapter reviews.

Technology Support

Vocabulary PuzzleMaker allows you to create crossword puzzles, jumble puzzles, or word searches in minutes to review chapter vocabulary. The puzzles can be printed or played on the computer screen.

Reading Support Workbooks

Reading Essentials provides summaries of each section of the textbook, focusing on the most important scientific concepts.

Reading and Writing Skills Activities

provides teachers with effective strategies for building students' skills in reading and writing about science.

Science Notebook presents a step-by-step approach to improving student note-taking ability with strategies based on the Cornell note-taking model. This workbook builds scientific and academic vocabulary skills, scientific writing skills, and ability in reading for critical content. Bloom's Hierarchy of Learning is used to indicate strategy levels.

In the Teacher Wraparound Edition

Project CRISS™ (Creating Independence through Student-Owned Strategies) strategies are highlighted in the Unit Openers where an activity is supplied that relates to unit content. For more information about Project CRISS™, visit www.projectcriss.com.

Use Science Words features encourage students to look up biology terms. Use these as a pre-reading activity, or have students keep a vocabulary journal.

Use Science Words

Word Origin Have students find the origin of the word *friction*. The word *friction* comes from the Latin word *fricare*, which means "to rub."

Additional Science Journal writing activities promote writing and critical thinking skills and extend the *Student Edition* journaling activity.

Active Reading Strategies utilize a variety of learning styles, and encourage cooperative learning and intrapersonal reflection on chapter content.

Making Concept Maps and Charts

Bubble Map Students brainstorm and organize words in clusters to describe concepts.

Flow Chart Students logically analyze and draw a sequence of events.

Cause-and-Effect Chart Students visually represent the causes and effects of an event or process.

Supporting-Idea Chart Students make a concept map to analyze relationships between a whole and its parts.

Network-Tree Concept Map Students show a hierarchy and use branching procedures.

Events-Chain Concept Map Students order steps or stages in a linear procedure.

Cycle Concept Map Students show how a series of events interact.

Spider Concept Map Students use for brainstorming and grouping nonrelated terms to a central idea.

Using the Science Journal

Double-Reference Journal Students read and record ideas.

Metacognition Students analyze what and how they have learned.

Learning Journal Students create notes and reflect on the content.

Problem-Solution Journal Students analyze problems and suggest workable solutions.

Speculation About Effects/Prediction Journal Students examine events and speculate about their possible long-term effects.

Synthesis Journal Students reflect on a project, a paper, or a performance task and plan how to apply what they have learned to their own lives.

Reflective Journal Students identify what they learned in an activity and record responses.

Quickwrites Students use spontaneous writing to discover what they already know.

Collaborative Learning Strategies

Pair of Pairs Partners respond to a question and compare their response to other pairs and to the class.

Write-Draw-Discuss Students write about and draw a picture of a concept, then share it with the class.

**Active Reading**

Learning Reading Have students divide a sheet of paper in half. Have them record research notes, lecture notes, and vocabulary terms related to the laws of motion in the left column. Tell them to use the right column to respond, interpret, question, and analyze left-column entries. L2 **Intrapersonal**

Four-Corner Discussion The class works in four groups to debate a complex issue.

Jigsaw Students work in groups to become experts on a portion of text and share what they've learned with the class.

Buddy Interviews Students interview one another to find out what strategies they use to learn the text.

Reciprocal Teaching Students take turns reading a section of text, retelling it in their own words, then asking questions about it.

News Summary Students are given several minutes to summarize, retell, or analyze an activity for a "TV" audience.

ReQuest The teacher reads aloud an article or story. Student pairs then construct discussion questions and review the content.

Assessment

Glencoe Science offers the Glencoe Assessment Advantage, a system designed to give you all the tools you need to prepare your students for success in any testing situation.

In the Student Edition

Section Review and **Applying Math** questions appear in every chapter.

Applying Math

5. **Solve One-Step Equations** The overall charge on the polyatomic sulfate ion, found in some acids, is 2^- . Its formula is SO_4^{2-} . If the oxygen ion has a 2^- oxidation number, determine the oxidation number of sulfur in this polyatomic ion.

Chapter Review questions help you evaluate students' knowledge and ability to apply science concepts.

Standardized Test Practice questions at the end of each chapter provide students with additional opportunities to practice their test-taking skills.

In the Teacher Wraparound Edition

Assessments located throughout the *Teacher Wraparound Edition* provide methods for assessing students' comprehension with Performance, Process, and Content exercises.

Assessment

Content Many benefits result from nuclear applications in medicine, but there are disadvantages, too. Ask students to write newspaper articles explaining how radiation can cause as well as treat cancer. Possible answers: It can cause mutations in cell structures, leading to tumor formation, or it can kill cancer cells. Use PASC, p. 141.

Teacher Classroom Resources

Performance Assessment in the Science Classroom

- Guidelines for assessing the performance of a task
- Reproducible activities for evaluating students
- Sample rubrics and checklists

Fast File Chapter Resources provides six pages of assessment for every chapter including *Testing Concepts*, *Applying Concepts*, and *Writing Skills*.

Technology Support

MindJogger Videoquizzes are interactive video quizzes set in game show format. Each is designed for the full range of student learning styles.

ExamView® Pro Testmaker CD-ROM for Windows® and Macintosh® provides an easy way to create, edit, and customize your tests. Select your own test items by State Standard, or write and edit your own. Translate tests from English to Spanish and vice versa.

Science Holistic Rubrics

The scoring rubrics below describe the characteristics of the answers required for each possible score for Short- and Extended-Response tasks.

Short-Response Tasks	
2 Points:	A score of two indicates that the student has demonstrated a thorough understanding of the scientific concepts and/or procedures embodied in the task. The student has completed the task correctly, in a scientifically sound manner. When required, student explanations and/or interpretations are clear and complete. The response may contain minor flaws that do not detract from the demonstration of a thorough understanding.
1 Point:	A score of one indicates that the student has provided a response that is only partially correct. For example, the student may arrive at an acceptable conclusion or provide an adequate interpretation, but may demonstrate some misunderstanding of the underlying scientific concepts and/or procedures. Conversely, a student may arrive at an unacceptable conclusion or provide a faulty interpretation, but could have applied appropriate and scientifically sound concepts and/or procedures.
0 Points:	A score of zero indicates that the student has provided a response that demonstrates no understanding of the science embodied in the task. The student explanation may be incorrect, uninterpretable, or contain clear misunderstandings of the underlying scientific concepts and/or procedures.

Extended-Response Tasks	
4 Points:	A score of four indicates that the student has demonstrated a thorough understanding of the scientific concepts and/or procedures embodied in the task. The student has completed the task correctly, used scientifically sound procedures, and provided clear and complete explanations and interpretations. The response may contain minor flaws that do not detract from a demonstration of a thorough understanding.
3 Points:	A score of three indicates that the student has demonstrated an understanding of the scientific concepts and/or procedures embodied in the task. The student's response to the task is essentially correct, but the scientific procedures, explanations, and/or interpretations provided are not thorough. The response may contain minor flaws that reflect inattentiveness or indicate some misunderstanding of the underlying scientific concepts and/or procedures.
2 Points:	A score of two indicates that the student has demonstrated only a partial understanding of the scientific concepts and/or procedures embodied in the task. Although the student may have arrived at an acceptable conclusion or provided an adequate interpretation of the task, the student's work lacks an essential understanding of the underlying scientific concepts and/or procedures. The response may contain errors related to misunderstanding important aspects of the task, misuse of scientific procedures/processes, or faulty interpretations of results.
1 Point:	A score of one indicates that the student has demonstrated a very limited understanding of the scientific concepts and/or procedures embodied in the task. The student's response is incomplete and exhibits many flaws. Although the student's response has addressed some of the conditions of the task, the student has reached an inadequate conclusion and/or provided reasoning that is faulty or incomplete. The response exhibits many flaws or may be incomplete.
0 Points:	A score of zero indicates that the student has provided a response that demonstrates no understanding of the science embodied in the task. The student explanation may be incorrect, uninterpretable, or contain clear misunderstandings of the underlying scientific concepts and/or procedures.

Meeting Individual Needs

Teaching Strategies

Following each suggested assessment and activity, ability levels are supplied to accommodate all students.

- **LS** Multiple Learning Styles logos are used throughout the text to indicate strategies that address different learning styles.
- **L1** Level 1 activities should be appropriate for students with learning difficulties.
- **L2** Level 2 activities should be within the ability range of all students.
- **L3** Level 3 activities are designed for above-average students.
- **ELL** English-Language Learners activities should be within the ability range of English-Language Learners or students who speak English as a second language (ESL).
- **COOP LEARN** Cooperative Learning activities are designed for small group work.
- **PBL** Problem-Based Learning activities apply real-world situations to learning.
- **P** Portfolio strategies represent student products that can be placed into a best-work portfolio.

Identifying Misconceptions

These short, diagnostic, and prescriptive lessons target common science misconceptions.

IDENTIFYING
Misconceptions

Necessary Metals Students may think it strange that metals are needed by the body. Explain that the metals calcium, potassium, and sodium, for example, help transmit electrical signals within the nervous system.

Multiple Learning Styles

Look for these italicized designations under various activities to help you target your lessons to each student's preferred learning style.

- ***Kinesthetic*** learners learn through touch, movement, and manipulating objects.
- ***Visual-Spatial*** learners think in terms of images, illustrations, and models.
- ***Interpersonal*** learners understand and work well with other people.
- ***Intrapersonal*** learners can analyze their own strengths and weaknesses and may prefer to work on their own.
- ***Linguistic*** learners write clearly and easily understand the written word.
- ***Logical-Mathematical*** learners understand numbers easily and have highly-developed reasoning skills.

Daily Interventions

Found at the end of each chapter section, this feature is designed to intercept students who are struggling and prescribe a system to help them get back on track. *Reteach* provides reinforcement of the section's concepts through visual activities.

DAILY INTERVENTION

Check for Understanding

Kinesthetic Have a student light a match and allow it to burn. Also, place an ice cube in a glass container and allow it to melt. Have students explain what type of changes took place with each item and describe the final properties of each.

Differentiated Instruction

These activities present various teaching strategies designed to help you meet the special needs of students with learning disabilities, physical challenges, visual impairment, and hearing impairment. Challenge activities provide opportunities for students who excel to engage in activities and research projects that extend the chapter's concepts. English-language learners in the classroom will also find exercises that bridge the gap between language barriers and the chapter content.

Differentiated Instruction

English-Language Learners Have students make flashcards with the name of a gland on one side and the hormone it produces on the other. Student pairs can quiz each other using the flashcards.

Cultural Diversity

These readings provide insights into the unique ways in which people of different ethnicities and cultural heritage have approached science. The intent of these features is to build awareness and appreciation for the global community in which we live.

Cultural Diversity

Tsunami! Tsunamis occur in many areas around the world and have been reported since ancient times. One of the earliest record tsunamis struck Syria around 2,000 B.C. Thera, one of the Cyclades Islands in the Mediterranean, may be the remnant of a volcano that erupted—causing tsunamis that ended the Minoan civilization on Crete. Tsunami is a Japanese word for “harbor wave.” Many have struck the Japanese shore. Because Japan is an island nation, the threat of tsunamis is a national safety concern. Today, by using expected tsunami characteristics, the Japan Meteorological Agency can forecast tsunami heights for the Japanese coastline. This provides residents with the knowledge necessary to move a safe distance away from the shore.

Inquiry-Based Science

The call for more inquiry-based science by the *National Science Education Standards* has been met by Glencoe Science.

Glencoe Science recognizes the importance of conducting inquiry-based science activities in the classroom. The process of doing inquiry models actual science practice, encouraging problem-solving strategies and developing critical thinking skills. Inquiry gets students actively involved in the learning process by allowing them to determine materials, procedures, or the topics and questions they want to investigate.

Inquiry can range from a very structured activity for those students who need more guidance to a more open-ended approach where students lead the investigations. Glencoe Science recognizes that the inquiry activities suggested will not look the same in every classroom. We encourage teachers to modify the suggested activities in a manner that best supports your students.

Glencoe also provides teachers with Alternative Inquiry Labs, teaching strategies or suggestions for making existing labs more inquiry-based.

Alternative Inquiry Lab

Extend the Experience To make this Lab an Inquiry Lab, have students examine the magnetic field around the motor, using a compass or iron filings. Test the armature and rotor before final assembly, as it will be difficult to fit the compass inside the motor. Encourage students to make various adaptations to the motor. Ask them to figure out how to make the motor spin the other way, spin faster, and spin slower. How could the motor be turned into a generator? How could they make the motor consume less power? Finally, students might research how these issues are handled by industry or other questions they find interesting.

Foldables™

Foldables™ are easy-to-make, three-dimensional, interactive graphic organizers that students create out of simple sheets of paper. These unique hands-on tools for studying and reviewing were created exclusively for Glencoe by education specialist Dinah Zike.

Research Behind Foldables™

According to research (Bransford, 1979; Corno, 1994), study strategies help students understand, organize, remember and apply new information presented in science textbooks. Some study strategies include concept mapping, highlighting, outlining, note taking, summarizing, and underlining (Peverly, Brobst, Graham & Shaw, 2003). Glencoe Science offers Dinah Zike's Foldables™ Study Organizers as an organizational tool and study guide for students.

Build Prereading Skills

- Encourages students to prepare for what they will be learning
- Gives students an opportunity to recall what they already know about a subject

Encourage Active Reading and Writing

- Practices basic reading and writing skills
- Develops skills in finding and reporting main ideas
- Organizes information
- Reviews key vocabulary terms

Summarize Content for Review

- Creates a comprehensive, interactive snapshot of the chapter
- Provides preparation support for chapter, unit, and end-of-course exams, as well as standardized tests

FOLDABLES™ Study Organizer

Acids, Bases, and Salts

The very essence of life, DNA, is an acid. You also may be familiar with ascorbic acid, or vitamin C. Make the following Foldable to compare and contrast the characteristics of acids, bases, and salts.

- STEP 1** Fold one sheet of paper lengthwise.

- STEP 2** Fold into thirds.

- STEP 3** Unfold and draw overlapping ovals. Cut the top sheet along the folds.

- STEP 4** Label the ovals *Acids*, *Salts*, and *Bases*.

Construct a Venn Diagram As you read the chapter, list the characteristics of acids, bases, and salts under the appropriate tabs.

Dinah Zike's Teaching with Foldables™ Science

- Sample presentations of Foldables™ instructions
- Ideas on how to incorporate Foldables™ into your lessons
- Easy-to-read folding instruction pages

Educational Partnerships

NATIONAL GEOGRAPHIC

Some topics in the chapter either require or benefit from a larger, more detailed visual explanation. The National Geographic Society has created *Visualizing* features that call out an important concept from the chapter and illustrate it in a way that will inform, excite, and motivate your students.

NATIONAL GEOGRAPHIC VISUALIZING SEED DISPERSAL

Figure 18

Plants have many adaptations for dispersing seeds, often enlisting the aid of wind, water, or animals.

- ▲ Equipped with tiny hooks, burrs cling tightly to fur and feathers.
- ▼ Dandelion seeds are easily dislodged and sail away on a puff of wind.
- ▲ Pressure builds within the seed-pods of this jewelweed plant until the pod bursts, flinging seeds far and wide.
- ▼ Some seeds buried by animals, such as this squirrel, go uneaten and sprout the next spring.
- ▲ Encased in a thick, buoyant husk, a coconut may be carried hundreds of kilometers by ocean currents.
- ▶ Blackberry seeds eaten by this white-footed mouse will pass through its digestive tract and be deposited in a new location.

Educational Partnerships

TIME SCIENCE AND HISTORY

Overcoming the Odds

Gifts and determination helped one pioneering doctor to save the lives of thousands

Fixing the Problem

Kountz discovered the root of the problem: why and how a patient's body rejected the transplanted kidney. He discovered that the patient's cells attacked and destroyed the small blood vessels of the transplanted kidney. So the new kidney could not filter blood, leaving it full of poisons. From this, doctors knew when to give patients the right kinds of drugs, so that their bodies could overcome the rejection process.

In 1959, Kountz performed the first successful kidney transplant. He went on to develop a procedure to keep body organs healthy for up to 60 hours after being taken from a donor. He also set up a system of organ donor cards through the National Kidney Foundation. And in his career, Dr. Kountz transplanted more than 1,000 kidneys himself—and paved the way for thousands more.

What kinds of medical breakthroughs has the last century brought? Locate an article that explains either a recent advance in medicine or the work that doctors and medical researchers are doing. Share your findings with your class.

TIME

TIME Magazine brings science topics and history together to further explain the chapter's main ideas and show how science relates to real life.

Research-Based Learning Strategies

Glencoe Science incorporates the most current and applicable educational research on science learning and follows recommendations from the American Association for the Advancement of Science and the National Science Teachers Association. The following research-based strategies can be found throughout the text.

Learning Strategies

The following research-based strategies can be found throughout the text:

- **Using Prior Knowledge** Glencoe Science encourages students to use their prior knowledge to learn information because this adds relevance to the material. Students are referred back to other parts of the text or to their own real-life experiences.
- **Practicing Important Tasks** By offering students an opportunity to practice important tasks using a variety of labs and activities in the *Student Edition*, *Teacher Wraparound Edition*, ancillaries and technology, Glencoe Science makes learning fun and relevant for students.
- **Using Visuals to Communicate, Organize, and Reinforce Learning** High-quality art and photos throughout the text communicate concepts more efficiently and reinforce learning, while allowing students to organize information.
- **Motivating Students to Achieve** Active strategies and real-world experiences motivate students to achieve. Throughout Glencoe's programs, students are encouraged to apply their knowledge in ways that will motivate them to learn.
- **Developing Decoding and Reading Comprehension Strategies** Throughout the text, students are supplied with caption questions, reading checks, and other strategies to aid in comprehension.
- **Using Study Strategies** Through the use of highlighting, outlining, note-taking, summarizing, and other such strategies, students can monitor their own progress and organize information more effectively, thereby increasing their scientific literacy. These strategies are found throughout the text and ancillaries.

The use of these strategies within Glencoe Science will help teachers to achieve the goals set forth by the *National Science Education Standards*.

White Paper

The Glencoe Science White Paper outlines the educational strategies on which this program was based. This document provides specific examples from the *Student Edition*, *Teacher Wraparound Edition*, ancillary program, and technology resources, highlighting extensive use of educationally sound strategies that help students learn science.

Spencer Grant/PhotoEdit, Inc.

Field Research and Testing

Feedback from students, teachers, curriculum supervisors, department chairpersons, parents, learning specialists, and science content experts is invaluable in the development of Glencoe's science programs.

Prior to Publication

- Detailed classroom teacher and curriculum supervisor **surveys** are conducted by independently contracted researchers.
- A **nationwide panel** of science teachers, curriculum supervisors, and department chairpersons provide countless hours of feedback and assistance throughout program development.
- A wide range of **educator and content reviewers** provide in-depth reviews of and suggestions for manuscripts and pre-publication versions of Glencoe's science programs.
- **Face-to-face interviews** with science teachers provide insight into teachers' day-to-day challenges.

Field-Test Results

- Field-test research indicates that test scores increased among students using Glencoe's science programs.
- Nine out of ten students earned higher scores after using Glencoe programs.
- Scores improved among both male and female students.
- Scores improved among both minority and non-minority students.
- Overall, the gap closed between the average pre-test score and a perfect score. Stated differently, on average, **scores increased after students used Glencoe's science programs.**

Field Research
and Testing

After Publication

- Field tests are conducted in which students and teachers use a pre-publication manuscript in the classroom.
- Follow-up interviews, observations, and surveys of Glencoe users provide ongoing opportunities for program development and verification of program success.

KS Studios

National Education Standards

How Glencoe Science Aligns with the National Science Education Standards

The correlations below show the close alignment between Glencoe Science and the grade-appropriate standards. Glencoe Science allows students to discover concepts within each of the content standards

and gives students opportunities to make connections among the science disciplines. Hands-on activities and inquiry-based lessons reinforce the science processes emphasized in the standards.

Correlation of *Florida Physical Science with Earth Science* to the National Science Education Standards.

Content Standard	Chapter and Section
(UCP) Unifying Concepts and Processes	
1. Systems, order, and organization	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 18-2, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1, 26-2, 26-3, 26-4
2. Evidence, models, and explanation	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 18-2, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1, 26-2, 26-3, 26-4
3. Change, consistency, and measurement	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 18-2, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1, 26-2, 26-3, 26-4
4. Evolution and equilibrium	2-1, 2-2, 2-3, 7-3, 8-1, 8-2, 8-3, 8-4, 12-2, 12-3, 12-4, 17-4, 23-1, 23-2, 23-3, 23-4, 26-2, 26-3, 26-4
5. Form and function	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 18-2, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-2, 26-3, 26-4
(A) Science as Inquiry	
1. Abilities necessary to do scientific inquiry	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1, 26-2, 26-3, 26-4
2. Understandings about scientific theory	1-1, 1-2, 1-3, 2-1, 2-2, 2-3, 3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 7-1, 7-2, 7-3, 8-1, 8-2, 8-3, 8-4, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-1, 11-2, 11-3, 11-4, 12-1, 12-2, 12-3, 12-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 16-3, 17-1, 17-2, 17-3, 17-4, 18-1, 19-1, 19-2, 19-3, 20-1, 20-2, 20-3, 20-4, 21-1, 21-2, 21-3, 21-4, 22-1, 22-2, 22-3, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1, 26-2, 26-3, 26-4
(B) Physical Science	
1. Structure of Atoms	16-2, 21-4, 24-1, 25-1, 25-2, 25-3, 25-4
2. Structure and properties of matter	4-1, 5-1, 5-2, 9-1, 9-2, 9-3, 9-4, 10-1, 10-2, 10-3, 11-2, 11-3, 11-4, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 16-1, 16-2, 18-1, 18-2, 19-1, 19-2, 19-3, 21-4, 22-1, 22-2, 23-1, 23-2, 23-3, 23-4, 24-1, 24-2, 24-3, 24-4, 25-1, 25-2, 25-3, 25-4, 26-1
3. Chemical reactions	18-2, 20-1, 21-1, 23-1, 23-2, 23-3, 23-4, 24-1, 24-3, 24-4
4. Motion and forces	3-1, 3-2, 3-3, 4-1, 4-2, 4-3, 5-1, 5-2, 6-1, 6-2, 6-3, 8-1, 8-3, 9-1, 9-3, 9-4, 10-1, 10-2, 10-3, 13-1, 13-2, 13-3, 14-1, 14-2, 14-3, 15-1, 15-2, 15-3, 17-2, 17-3, 22-1, 22-2, 22-3, 26-1, 25-4, 26-2
5. Conservation of energy and increase in disorder	5-2, 9-1, 9-2, 9-4, 10-1, 10-3, 19-1, 19-2, 19-3
6. Interactions of energy and matter	6-1, 6-2, 6-3, 9-1, 9-2, 9-3, 10-1, 10-2, 10-3, 11-2, 11-4, 13-3, 15-1, 15-2, 15-3, 17-2, 17-3, 18-2, 19-1, 19-2, 19-3, 22-1, 22-2, 22-3, 23-3, 23-4, 24-2, 26-4
(C) Life Science	
1. Biological Evolution	8-4
2. Matter, energy, and organization in living systems	8-4, 17-3
3. The behavior of organisms	8-4, 11-4, 17-1
(D) Earth and Space Science	
1. Energy in the Earth system	7-1, 12-1, 12-2, 12-3, 12-4, 14-1, 15-1, 16-1, 16-3, 17-1, 17-2, 17-3, 17-4, 20-1, 20-2, 20-3, 20-4, 21-2
2. Geochemical cycles	12-4, 16-1, 16-3, 17-1, 17-2, 20-1, 20-2, 20-3, 20-4, 21-2, 21-3

3. The origin and evolution of the Earth system	7-1, 7-3, 8-1, 8-2, 8-3, 8-4, 12-2, 12-3, 12-4, 14-1, 16-1, 16-3, 17-4, 21-4
4. The origin and evolution of the universe	7-3, 8-1, 8-3, 8-4, 26-4
(E) Science and Technology	
1. Abilities of technological design	2-1, 2-2, 2-3, 12-2, 21-4
2. Understandings about science and technology	2-1, 2-2, 2-3
(F) Science in Personal and Social Perspectives	
1. Personal and community health	11-1, 22-2, 25-3, 25-4, 26-1, 26-2, 26-4
2. Population growth	16-2, 16-3, 26-4
3. Natural Resources	20-1
4. Environmental quality	16-2, 16-3, 17-4, 21-3
5. Natural and human-induced hazards	1-1, 2-2, 12-2, 12-4, 17-4, 21-3
6. Science and technology in local, national, and global challenges	13-3, 2-1, 2-2, 2-3, 12-2, 26-1, 26-2
(G) History and Nature of Science	
1. Science as a human endeavor	22-4
2. Nature of scientific knowledge	1-1, 1-2, 1-3, 2-2, 2-3, 3-3, 21-4, 23-4
3. History of science	5-2, 8-1, 8-2, 8-3, 9-2, 10-3, 14-2, 14-3, 15-1, 15-3, 19-1, 19-2, 19-3, 20-1, 22-3, 23-1, 23-4, 25-1, 25-4, 26-3, 26-4

How Glencoe Science Aligns with the NCTM Standards for Grades 9–12

Throughout Glencoe Science, each Applying Math activity provides students with the opportunity to practice and apply some of the mathematical concepts and applications described in

the NCTM Standards. These activities serve to reinforce mathematical skills in real-life situations, thus preparing students to meet their needs in an ever-changing world.

Correlation of Florida Physical Science with Earth Science to NCTM Standards

Math Standard	Page

Learning in the Laboratory

In the Student Edition

Working in the lab is perhaps the most exciting part of science. Labs and MiniLABs give your students the hands-on opportunity to create, investigate, and explore science. Students will learn new material, while having fun.

Traditional Labs provide guided inquiry as students hypothesize, plan investigations, and collect and analyze data.

Design Your Own Labs challenge students to design their own experiments that will provide answers to lab problems.

Model and Invent Labs allow students to create a model or invent a product that can demonstrate scientific concepts.

Use the Internet Labs help students share and retrieve data from others around the country and world, by posting data they have collected on fl.gpescience.com. These activities show students the possible range of data, importance of collecting large amounts of data, and data analysis.

MiniLABs and **Applying Science** activities are a quick way for students to practice specific process skills as they learn science concepts. Many of them can be classroom demonstrations or homework assignments.

In the Teacher Wraparound Edition

Quick Demos allow students to visualize biology concepts.

Inquiry Labs in each chapter can be used to support inquiry-based science or as alternatives to traditional labs.

Technology Support

Virtual Labs CD-ROM includes a collection of interactive activities involving major chapter themes that allow students to understand science concepts in a virtual setting. These labs provide a way to conduct experiments without classroom time, cost, and safety constraints.

Video Labs show students step-by-step lab procedures while emphasizing important lab safety skills. The lab videos also include teacher support, troubleshooting advice, and expected outcomes.

Additional Resources

Laboratory Activities offer a variety of traditional laboratory experiences that reinforce the biology principles in the text. The *Teacher Wraparound Edition* provides full support.

Probeware Labs present activities for students to explore scientific concepts using a probeware data collection system. These hand-held systems provide a fast and simple way to collect, view, and analyze data in the classroom or during a field investigation. Integrating technology in the classroom is made simple with step-by-step instructions for setting up and using probeware.

Science Inquiry Lab Manual gives students the opportunity to become increasingly independent in stating hypotheses, designing and performing experiments, and collecting and analyzing data.

Safety in the Laboratory

All activities are designed to minimize dangers in the laboratory. Careful laboratory planning and management by both the instructor and the student are essential to a safe laboratory experience. **Local, state, and federal laboratory safety laws and regulations must be strictly followed.** The information provided here is one of the many resources to which you can refer for information about laboratory safety.

Classroom and Laboratory Preparation

1. Label and store chemicals properly and securely. See p. 20T.
2. Store equipment properly and securely and other thing.
 - a. Clean and dry all equipment before storing.
 - b. Protect electronic equipment and microscopes from dust, humidity, and extreme temperatures.
 - c. Number, catalog, and organize equipment.
3. Ensure adequate work space for each student.
4. Ensure adequate classroom and storeroom ventilation.
5. Explain and post safety and evacuation guidelines along with expectations of conduct.
6. Ensure that all safety equipment is functioning properly and is clearly visible.
7. Provide hot plates as a heat source whenever possible. If gas burners are used, know where the central gas supply shutoff valve is located.
8. Ensure that each workstation has a GFCI-protected electrical source.
9. Provide safety goggles consistent with ANSI Standard Z87.1 for each student, including students who wear corrective lenses.

First Day of Class (with students)

1. Distribute and discuss safety rules, safety symbols, and first aid guidelines. Have students to review safety symbols and guidelines.
2. Review safe use of equipment and chemicals.
3. Review use and location of safety equipment.
4. Discuss safe disposal of materials and laboratory cleanup policy.
5. Discuss proper laboratory attitude and conduct.
6. Document students' understanding of the preceding points. Have students sign a safety contract and return it.

Before Each MiniLAB or Lab

1. Perform each investigation yourself before assigning it.
2. Arrange the lab in such a way that equipment and supplies are clearly labeled and easily accessible.
3. Have available only equipment and supplies needed to complete the assigned investigation.
4. Review the procedure with students, emphasizing any caution statements or safety symbols that appear.
5. Be sure all students know the proper procedures to follow if an accident should occur.
6. Provide containers for disposing of chemicals, waste products, and biological specimens. Disposal methods should meet local guidelines.

During the MiniLAB or Lab

1. Make sure the lab is clean and free of clutter.
2. Insist that students wear goggles and aprons.
3. Never allow a student to work alone in the lab.
4. Never allow students to use a cutting device with more than one edge.
5. Students should not point the open end of a heated test tube toward anyone.
6. Remove broken glassware or frayed cords from use. Also clean up any spills immediately. Dilute solutions with water before removing.
7. Be sure all glassware that is to be heated is of a heat-treated type that will not shatter.
8. Remind students that hot glassware looks cool.
9. Prohibit eating and drinking in the lab.

After the MiniLAB or Lab

1. Be sure that the lab is clean.
2. Be certain that students have returned all equipment and disposed of broken glassware and chemicals properly.
3. Be sure that all hot plates and electrical connections are off.
4. Insist that each student wash his or her hands when lab work is completed.

Chemical Storage and Disposal

General Guidelines

Be sure to store all chemicals properly. The following are guidelines commonly used. Your school, city, county, or state may have additional requirements for handling chemicals. It is the responsibility of each teacher to become informed of the rules or guidelines in effect in his or her area.

1. Separate chemicals by reaction type. Strong acids should be stored together. Likewise, strong bases should be stored together and should be separated from acids. Oxidants should be stored away from easily oxidized materials, and so on.
2. Be sure all chemicals are stored in labeled containers indicating contents, concentration, source, date purchased (or prepared), any precautions for handling and storage, and expiration date.
3. Dispose of any outdated or waste chemicals properly according to accepted disposal procedures.
4. Do not store chemicals above eye level.
5. Wood shelving is preferable to metal. All shelving should be firmly attached to the wall and should have anti-roll edges.
6. Store only those chemicals that you plan to use.
7. Hazardous chemicals require special storage containers and conditions. Be sure to know which chemicals those are and the accepted practices for your area. Some substances must be stored outside the building.
8. When working with chemicals or preparing solutions, observe the same general safety precautions that you would expect from students. These include wearing an apron and goggles. Wear gloves and use the fume hood when necessary. Students will want to do as you do whether they admit it or not.
9. If you are a new teacher in a particular laboratory, it is your responsibility to survey the chemicals stored there to be sure they are stored properly. If not, they should be disposed of. Consult the rules and laws in your area concerning which chemicals can be kept in your classroom. For disposal, consult up-to-date disposal information from state and federal governments.

Disposal of Chemicals

Local, state, and federal laws regulate the proper disposal of chemicals. These laws should be consulted before chemical disposal is attempted. Although many substances encountered in the science classroom can be flushed down the drain with plenty of water, it is not safe to assume that this is always true. Teachers who use chemicals should consult the following book from the National Research Council:

Prudent Practices in the Laboratory. Washington, DC: National Academy Press, 1995. This book is useful and was revised in 1995. Current laws in your area would, of course, supersede the information in this book.

DISCLAIMER

Glencoe Publishing Company makes no claims to the completeness of this discussion of laboratory safety and chemical storage. The material presented is not all-inclusive, nor does it address all of the hazards associated with handling, storing, and disposing of chemicals, or with laboratory management.

Clement Mok/PictureQuest

Preparation of Solutions

It is important to use safe laboratory techniques when handling all chemicals. Always check the MSDS (Material Safety Data Sheet) for each chemical before using it in the classroom. Many substances might appear harmless, but might be toxic, corrosive, or very reactive. Chemicals should never be ingested. Use proper techniques to smell any chemical, wear safety goggles and an apron in the laboratory, and observe the following precautions.

- 1. Dilution of Acids and Bases** When diluting acids with water, always add the acids to the water. Never add water to acids. When sulfuric acid and sodium hydroxide are added to water, a large amount of thermal energy is released. Use extra care when handling these substances.
- 2. Poisonous and Corrosive Liquids or Vapors** Use a fume hood if possible. Examples include hydrochloric acid, acetic acid, nitric acid, and ammonium hydroxide.
- 3. Poisonous and Corrosive to Eyes, Lungs, and Skin** Examples include acids, bases, silver nitrate, iodine, and potassium permanganate.

Bromthymol blue: Add 0.5 g bromthymol blue powder to 500 mL distilled water to make a BTB stock solution. Dilute 40 mL BTB stock solution to 2 L with distilled water. Solution should be bright blue. If not, add one drop of NaOH at a time, swirling to mix. Check color.

Hydrochloric acid (HCL) solution: To make a 5% solution, add 13.6 mL concentrated HCl to 73 mL water while stirring. To make a 0.1M solution, add 1 mL concentrated hydrochloric acid to 100 mL water while stirring.

Iodine solution/Iodine stain: Dilute 1 part Lugol's solution with 15 parts water.

Limewater solution: Add up to 1 gallon of distilled or tap water to 1 teaspoon of calcium hydroxide (Limewater is a saturated solution; a teaspoon will yield a fully saturated solution if you use one gallon of water or less.). Shake the jar vigorously for one to two minutes, then let it stand for 24 hours. Pour the clearer portion off the top of the solution through a coffee filter or filter paper, being careful not to stir up any sediment. Repeat the filtering if necessary to produce a clear limewater solution.

Lugol's solution: Dissolve 10 g potassium iodide in 100 mL distilled water. Then add and dissolve 5 g iodine. Store in dark bottle. Keeps indefinitely.

Phenolphthalein indicator: From a drug store, buy a package of any laxative that contains

phenolphthalein. To make 1% solution, mash 4 tablets and pour the powder into 10 mL of rubbing alcohol. Let mixture soak for 15 minutes. Pour liquid into and store in a dropper bottle.

Potassium permanganate: For a 0.01M solution of potassium permanganate, dissolve 0.15 g KMnO_4 in 100 mL water.

Red cabbage concentrate: Put 5 leaves of red cabbage in a pot. Add 1 L of water, bring to a boil, and simmer until water turns a deep purple. Pour liquid through a strainer or piece of cheesecloth into a storage bottle. Keep refrigerated.

Salt solution: For a 3.5% salt (NaCl) solution that simulates the concentration of ocean water, dissolve 35 g of salt (NaCl) in 965 mL of water. For a 1% solution (weak), dissolve 1 g of salt (NaCl) in 99 mL of water. For a 6% solution, dissolve 6 g of salt (NaCl) in 94 mL of water.

Silver nitrate solution: To make a 10% solution, put 5 g of silver nitrate in 50 mL of distilled water.

Sugar solution: Add 1 tablespoon of sugar to 1 cup of warm water in a deep jar or flask. Stir to dissolve.

Sodium hydroxide (dilute): To make a 1% solution, dissolve 1 g NaOH in 99 mL of water.

Equipment and Materials List

These easy-to-use tables of equipment and consumable materials can help you prepare for your science classes for the year. Refer to the Chapter Organizer in front of each chapter for a list of equipment and materials used for each laboratory activity in the chapter.

Consumables			
Material	Launch Lab (Chapter)	MiniLAB (Chapter-Section)	Lab (Chapter-Section)
adding machine tape	8, 21		
agar gel	23		
alum			24-4
aluminum foil		3-3, 14-1, 16-1	15-2
ammonia	24		
antacid tablet		24-3	
baking soda			23-4
balloon	9	22-2	23-4, 26-4
butter		9-3	
cabbage indicator (homemade)			24-4
can of food	6-2		
candies (various colors)		25-1	
candle		16-1	9-3
cardboard	24	17-2	6-3
cardboard box			5-1, 16-3
cardboard tube	26		14-3
chalk	7		
clay		25-3	
cloth		14-1, 16-3, 19-3	
coffee can	16		
construction paper (various colors)	15, 25	19-1	7-2, 16-3
copper bromide (crystals)		23-4	
cotton swab	24		
cream of tartar			24-4
dilute hydrochloric acid: HCl		24-3	20-4
envelope (large)	19		
filter paper		18-2	18-1, 24-4
food coloring	18, 22	17-1	17-1
fruit preservative			24-4
hydrogen peroxide: H ₂ O ₂ (3%)			23-4
index cards, 3-in × 5-in		23-1	
index cards, 4-in × 6-in		22-1	
leaf		19-3	
manganese dioxide: MnO ₂			23-4
milk		12-4	
nail (iron, aluminum)	23		20-1, 20-4
pancake mix		12-4	
paper (graph)		8-1	12-4
paper (white)			12-4

Material	Launch Lab (Chapter)	MiniLAB (Chapter-Section)	Lab (Chapter-Section)
paper, 11-in × 17-in			19-3
paper clip	5, 10	3-3, 5-2, 14-1, 19-3	11-3
pepper			9-3, 18-1
phenolphthalein	24		
plaster of paris		22-3	
plastic sheet (clear)			8-2
plate (paper)		9-1	
rice		26-2	
rock		3-3	
rock samples			20-4
salt		1-3, 9-1, 21-1, 20-3	18-1
sand		15-2	8-4, 23-4
soil			8-4
splint (wooden)			23-4
steel wool	5		
string		4-2, 11-1	
sugar (granulated, cubes)	25	21-1, 25-1	18-1, 24-4
taffy (large bar)		12-2	
tape (double-sided)		26-1	
tape (electrical)	5		
tape (masking)		3-1, 4-2, 9-2	4-3, 5-1, 11-3, 24-4
tape (transparent)	25	23-1	8-2
thread		14-1	
universal indicator		24-3	
vegetable oil	22		
vinegar	24	23-4	
water (distilled)			24-4
waxed paper			24-4
wire	13	13-2	13-2, 14-3
wool		22-2	
Nonconsumables			
ammeter			14-3
baking sheet		3-3, 21-2	
balance	4	5-1	3-3, 4-3, 5-1, 6-3, 18-1
ball (plastic, slotted)		4-1	
ball (rubber)			4-3, 5-1
ball (white)		7-3	
baseball		19-3	4-2
battery	5, 13	13-2	13-2
bead (plastic)		9-3	
beaker, 10-mL			17-1
beaker, 150-mL		15-2, 16-1	23-4
beaker, 200-mL	18	17-1	
beaker, 250-mL		24-3, 25-3	18-1, 23-4, 24-4
beaker, 400-mL			9-4
beaker, 500-mL	9	9-3	9-3, 17-1
beaker, 1000-mL			17-1
binder clip			26-4

Material	Launch Lab (Chapter)	MiniLAB (Chapter-Section)	Lab (Chapter-Section)
block (wooden)		3-3

Sound and Light—318

- Section 1** Sound320
- Section 2** Reflection and Refraction of Light327
- Section 3** Mirrors, Lenses, and the Eye331
 - Lab** Reflections of Reflections338
- Section 4** Light and Color339
 - Lab: Design Your Own**
Blocking Noise Pollution344–345

chapter

12

Earth's Internal Processes—352

- Section 1** Evolution of Earth's Crust354
- Section 2** Earthquakes362
- Section 3** Earth's Interior370
- Section 4** Volcanoes373
 - Lab** A Case for Pacific Plate Motion379
 - Lab** Earthquake! Earthquake!
Where's the earthquake?380–381

unit

4

Forms of Energy—388

chapter

13

Electricity—390

- Section 1** Electric Charge392
- Section 2** Electric Current400
 - Lab** Identifying Conductors and Insulators ...406
- Section 3** Electrical Energy407
 - Lab: Design Your Own**
Comparing Series and Parallel Circuits .414–415

chapter 14

Magnetism—422

Section 1	Magnetism	424
Section 2	Electricity and Magnetism	431
Section 3	Producing Electric Current	438
	Lab Electricity and Magnetism	445
	Lab: Design Your Own	
	Controlling Electromagnets	446–447

chapter 15

Electromagnetic Radiation—454

Section 1	What are electromagnetic waves?	456
Section 2	The Electromagnetic Spectrum	462
	Lab The Shape of Satellite Dishes	468
Section 3	Radio Communication	469
	Lab: Use the Internet	
	Radio Frequencies	476–477

chapter 16

Energy Sources—484

Section 1	Fossil Fuels	486
Section 2	Nuclear Energy	494
Section 3	Renewable Energy Sources	501
	Lab Solar Heating	507
	Lab: Use the Internet	
	How much does energy really cost?	508–509

chapter 17

Weather and Climate—516

Section 1	Earth's Atmosphere	518
	Lab Visualizing a Temperature Inversion	523
Section 2	Weather	524
Section 3	Climate	529
Section 4	Earth's Changing Climates	535
	Lab: Design Your Own	
	Investigating Microclimate	540–541

In each chapter, look for these opportunities for review and assessment:

- Reading Checks
- Caption Questions
- Section Review
- Chapter Study Guide
- Chapter Review
- Standardized Test Practice

Contents

Unit 5

Matter and Earth Materials—548

chapter

18

Classification of Matter—550

- Section 1** Composition of Matter552
 Lab Comparing Pure Substances
 and Mixtures559
- Section 2** Properties of Matter560
 Lab: Design Your Own
 Measuring the Conservation of Mass ...568–569

chapter

19

Properties of Atoms and the Periodic Table—576

- Section 1** Structure of the Atom578
- Section 2** Masses of Atoms584
- Section 3** The Periodic Table588
 Lab A Periodic Table of Foods597
 Lab: Use the Internet
 What's in a name?598–599

chapter

20

Earth Materials—606

- Section 1** Minerals608
 Lab Be a Mineral Detective616
- Section 2** Igneous Rocks617
- Section 3** Sedimentary Rocks624
- Section 4** Metamorphic Rocks and the Rock Cycle630
 Lab Identifying Rocks636–637

chapter 21

Earth's Changing Surface—644

Section 1	Weathering and Soil	646
	Lab Graphing Soil Textures	653
Section 2	Shaping the Landscape	654
Section 3	Groundwater	663
Section 4	Geologic Time	669
	Lab It's about time—relative, that is.	676–677

In each chapter, look for these opportunities for review and assessment:

- Reading Checks
- Caption Questions
- Section Review
- Chapter Study Guide
- Chapter Review
- Standardized Test Practice
- Online practice at gpscience.com

unit 6

Interactions of Matter—684

chapter 22

Chemical Bonds—686

Section 1	Stability in Bonding	688
	Lab Atomic Trading Cards	693
Section 2	Types of Bonds	694
Section 3	Writing Formulas and Naming Compounds ...	703
	Lab: Model and Invent	
	Modeling Chemical Bonding	710–711

chapter 23

Chemical Reactions—718

Section 1	Chemical Changes	720
Section 2	Chemical Equations	726
Section 3	Classifying Chemical Reactions	730
Section 4	Reaction Rates and Energy	734
	Lab Catalyzed Reaction	741
	Lab Investigating Reaction Conditions ...	742–743

Contents

chapter

24

Solutions, Acids, and Bases—750

- Section 1** How Solutions Form752
- Section 2** Solubility and Concentration759
- Section 3** Acids, Bases, and Salts764
- Section 4** Strength of Acids and Bases771
 - Lab** Determining Acidity775
 - Lab** Saturated Solutions776–777

chapter

25

Nuclear Changes—784

- Section 1** Radioactivity786
- Section 2** Nuclear Decay791
- Section 3** Detecting Radioactivity796
- Section 4** Nuclear Reactions801
 - Lab** Chain Reactions807
 - Lab: Model and Invent**
Modeling Transmutations808–809

chapter

26

Stars and Galaxies—816

- Section 1** Observing the Universe818
- Section 2** Evolution of Stars823
 - Lab** Star Cluster Age830
- Section 3** Galaxies and the Milky Way831
- Section 4** Cosmology836
 - Lab: Model and Invent**
Expansion of the Universe840–841

- 2 Forces that Shape Technology
- 3 Developing Technology

While completing **Recycling Plastics**, students will investigate the history of plastics, what defines the seven classes of plastics and their uses, the chemistry behind plastics, and how they can be recycled—compared to paper, glass, and aluminum. Completing a table listing each type of plastic, its normal use, and into what it can be recycled might help students become more active, responsible, and aware citizens.

How Are Billiards & Bottles Connected?

PROJECT

CRISS

Study Skills

Active Reading Questions will arise in the students' minds as they read. Encourage students to write these questions in their Science Journals to aid in their understanding of the diversity of matter. Questions about elements, organic compounds, and newly-developed and versatile materials can be addressed in a whole-class discussion.

Billiards, a popular table game of the 1800s, used balls carved from ivory. In the 1860s, an ivory shortage prompted one billiard-ball manufacturer to offer a reward of \$10,000 to anyone who could come up with a suitable substitute. In an attempt to win the prize, an inventor combined certain organic compounds, put them into a mold, and subjected them to heat and pressure. The result was a hard, shiny lump that sparked a major new industry—the plastics industry. By the mid-1900s, chemists had invented many different kinds of moldable plastic. Today, plastic is made into countless products—everything from car parts to soda bottles.

unit projects

Visit unit projects at fl.gpscience.com to find project ideas and resources. Projects include:

- **History** Explore the history of ceramics and the way it meets advanced technological needs as you construct a ceramics time line.
- **Career** Develop 12 trivia cards on the life of dreamer Freidrich August Kekule, chemist and theorist.
- **Model** Develop a new use for new materials, design blueprints, conduct a patent search, and present your idea to fellow class scientists.

WebQuest *Recycling Plastics* investigates the history of plastics, the seven classes of plastics, their chemistry, and how they can be recycled. Become a more active, aware, and responsible citizen.

unit projects

History Have students explore the use of ceramics in society. Have students construct a time line of 20 uses of this ancient material and how it is being used in new and creative ways with constantly changing technology.

Career Ask students to research Freidrich August Kekule and his contribution to chemistry and theory. Have students develop 12 interesting facts about Kekule and present them in a question-and-answer-trivia format.

Model Working with a partner, have students design a unique use for ceramics, polymers, alloys, or other new materials. Have students draw a “blueprint,” conduct a patent search for similar devices, and then modify their design based on their research. Using visual aids, students may then host presentations of their new product to fellow class scientists.

Additional Resources Visit unit projects at fl.gpscience.com for more information, resources, and assessment rubrics.

How Are Billiards & Bottles Connected?

- Ask students how they can identify plastics. Have them write down their thoughts and revise them as they study more about different types of materials.
- Ask students to define the term *diverse*. Emphasize to students that matter is diverse, and different types of matter can

be classified into even more diverse categories.

- Ask students how the plastic in a billiard ball differs from that in a bottle. Point out that the term *plastic* refers to a type of material, not a specific one.

Section/Objectives	Standards		Labs/Features
	National	State/Local	
Chapter Opener	See p. 16T–17T for a Key to Standards.		Launch Lab: Understanding Measurements, p. 5 Foldables, p. 5
Section 1 The Methods of Science  1 session  .5 block 1. Identify the steps scientists often use to solve problems. 2. Describe why scientists use variables. 3. Compare and contrast science and technology.	National Content Standards: UCP.1–3, UCP.5, A.1, A.2, F.5, G.2	Florida Benchmarks: SC.H.1.4.1, SC.H.2.4.1, SC.H.2.4.2	Science Online, p. 7 Integrate History, p. 9 Integrate Earth Science, p. 11 Science Online, p. 12
Section 2 Standards of Measurement  2 sessions  1 block 4. Name the prefixes used in SI and indicate what multiple of ten each one represents. 5. Identify SI units and symbols for length, volume, mass, density, time, and temperature. 6. Convert related SI units.	National Content Standards: UCP.1–3, UCP.5, A.1, A.2, G.2		Applying Math: Centimeters, p. 16 Integrate Earth Science, p. 17 Science Online, p. 18 MiniLAB: Determining the Density of a Pencil, p. 19  Video Lab Visualizing SI Dimensions, p. 20
Section 3 Communicating with Graphs  2 sessions  1 block 7. Identify three types of graphs and explain the ways they are used. 8. Distinguish between dependent and independent variables. 9. Analyze data using the various types of graphs.	National Content Standards: UCP.1–3, UCP.5, A.1, A.2, G.2		Applying Math: Temperature, p. 24 MiniLAB: Graphing Temperature Change, p. 25 Lab: What's my graph?, p. 27 Lab: Developing a Measurement System, pp. 28–29 Science and Language Arts: Thinking in Pictures: and other reports from my life with autism, p. 30

Section Focus

Section Focus Transparency **Splendid Science** **Chapter 1**

Scientists work in different areas and different ways. These pictures illustrate the three main divisions of science: life science, earth science, and physical science. Scientists often work in more than one area, requiring them to have a broad base of knowledge. A biologist, for example, needs to know a good deal of chemistry to understand cell functions.

1. Volcanoes are a topic studied in Earth science. Who might you need to know some physical science when studying volcanoes?
2. What is the general purpose of science?
3. What do the three divisions of science have in common?

L2

Section Focus Transparency **Pick a Scale and Go with It** **Chapter 1**

What does an Italian scientist say that the temperature is thirty-two degrees? It depends entirely on the scale that she's using. Referring to a temperature of 32° might mean that it's a hot summer day or that it's so cold that everyone is in frozen solid.

1. Label the three pictures 32°F, 32°C, and 32 K.
2. Why must a measurement include the units in order to be meaningful?
3. What kind of units do you use to measure length? Mass?

L2

Section Focus Transparency **Data by Graph** **Chapter 1**

Sometimes the best way to communicate information is with a graph. Circle graphs are a good way to show the parts of a whole—in this case, the U.S. population by age.

United States Population by Age

0-14 years 21%
15-64 years 56%
65 years and older 23%

What information does the circle graph provide? Could you have obtained that information by looking at the photograph? What else would you display these data?

Would it be useful to list all the people in the U.S. along with their ages? Why or why not?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Assessment Transparency **The Nature of Science** **Chapter 1**

Directions: Complete each exercise in tables and answer the following questions.

Time (s)	Approximate Speed (m/s)	Time (s)	Approximate Speed (m/s)
0	0	6	60
1	10	7	70
2	20	8	80
3	30	9	90
4	40	10	100
5	50	11	110

1. The above data were collected during an experiment to find out the speed of an object dropped from a tall building. Which type of graph would be the best way to display this information?

A. bar graph
B. pie graph
C. line graph

2. According to these data, about how fast would the object be dropping after 11 seconds?

A. 90 m/s
B. 100 m/s
C. 110 m/s
D. 120 m/s

3. An independent variable is the factor that affects the measure of the other variable. What independent variable could have been added to this experiment?

A. time
B. speed
C. height
D. graph

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.
- COOP LEARN** Cooperative Learning activities are designed for small group work.
- LS** Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.
- P** These strategies represent student products that can be placed into a best-work portfolio.
- PBL** Problem-Based Learning activities apply real-world situations to learning.

Solving a Measurement Problem

This type of problem asks you what we often encounter in determining the cost of something. When the price of a dozen eggs was 75¢, I just drove from the grocery store, returned a small carton, and realized you may be not shopping and need to know of a single item's cost. In this task, you will use what you learned about unit rates to find the cost of a single item.

Procedure

1. Write _____

Large paper (1 lb.)

Small paper (1 lb.)

Large paper (1 lb.)

Small paper (1 lb.)

Write in the table the unit rates for each item.

Item	Unit Rate

Science Content Background

The Methods of Science Scientific Methods

Many science educators are no longer using the term “the scientific method.” This is because there is really no one method; an astronomer works in ways that are very different from those of a medical researcher. Also, science does not always proceed in the linear manner described by “the scientific method.” The term “scientific methods” indicates that a variety of approaches are employed in scientific inquiry.

Investigations will sometimes use a null hypothesis. This null hypothesis is usually the opposite of the scientist’s hypothesis for what will happen in the investigation. Thus if a medical researcher thinks Drug PR will help cure disease PQ, a null hypothesis could be that there will be no difference in symptoms between people who received PR and those who didn’t receive it. If the data show that the null hypothesis is false, then this is evidence that the original hypothesis may be correct.

The term *experiment* should be reserved for occasions when scientists or students manipulate a variable to see the result. The independent variable is the thing or variable that is changed. This is done to see the effect on the dependent variable.

In human drug experiments, a drug is given to a treatment group and a placebo is given to a control group. A placebo is something, such as a sugar pill, that resembles medication but contains no drug. It is given because people often get better just because they believe they are taking something that will help even though they are not. The people in the drug experiment don’t know whether they are taking the new drug or the placebo.

Using Science—Technology

Pure science is often contrasted with applied science. Pure science seeks knowledge just for the sake of knowledge. Applied science seeks to develop technologies that improve people’s lives.

While science certainly leads to the development of technologies, technologies also lead to the development of science. The invention of the light microscope advanced the field of cell biology. Other technologies that have influenced science include gel electrophoresis, telescopes, and particle accelerators.

Barry L. Runk/Grant Heilman Photography, Inc.

Standards of Measurement Measurement Systems

The SI system of measurement allows easy conversions among SI units. The SI system stops being easy when measurements are converted into English units. A gram is approximately the mass of one regular-size paper clip. A kilometer is 2.5 times around an Olympic track. A liter is just a bit more than a quart of milk.

Measuring Distance

A common metric unit for area is the hectare. One hectare is equal to 10,000 square meters.

Measuring Time and Temperature

Three systems of units are commonly used for temperature. Almost all the people in the world use the Celsius system. People in the United States use the Fahrenheit system. While United States scientists typically use the Celsius or Kelvin system, many United States meteorologists use Fahrenheit. The Kelvin is the official SI unit for temperature.

Measuring Matter

Water has a density of 1 g/cm^3 , so if you didn't have a scale you could measure 5 g of water by using a graduated cylinder to measure 5 mL, which is 5 cm^3 , of water. Objects that have a density greater than 1 g/cm^3 sink in water and those with a lower density float.

Communicating with Graphs

Choosing the Right Graph

Line graphs are appropriate for continuous data. Continuous data are numerical data that have an uninterrupted range of values such as time of travel, growth in height of a plant, or current flow in a wire. Bar graphs are appropriate for categorical or nominal data. These are data that fall into defined categories or that have specific names such as boys and girls, types of primates, or types of fruits.

Teacher to Teacher

Erin Peters, Lead Science Teacher
Williamsburg Middle School
Arlington, VA

"When discussing the nature of science it is important to distinguish between observation and inference. Place raisins in carbonated water with yellow food coloring and lead the students to believe that they are 'sewer slugs,' (fictitious) animals that purify sewage. When the students realize the 'animals' are fictitious, begin to analyze which of their statements were observations and which statements were inferences. In addition, discuss what statements are appropriate for a scientific discussion, as opposed to everyday conversations."

Erin Peters

Out of This World

The space program was developed in response to many unanswered questions. Scientists have worked together to develop ways in which to answer those questions. In this chapter, you will learn how scientists learn about the natural world.

Science Journal Look at the picture above. Write in your Science Journal why scientists study space.

Theme Connection

Systems and Interactions Scientific methods provide a system for observing interactions in the world, testing those observations, and forming hypotheses, theories, and laws about how and why interactions occur and have the consequences they do.

About the Photo

Space Program The space program was developed in response to many unanswered questions. Scientists all over the world have worked together to develop ways in which to answer some of those questions. In this chapter, you will learn how scientists learn about the natural world, the system that has been developed to standardize measurements, and how patterns are detected in data.

Start-Up Activities

Understanding Measurements

Before there were measurement standards, people used parts of the body for measuring items. The length from the tip of the elbow to the end of the middle finger was a *cubit*. Egyptians used this measurement in construction. The foot was the length of a man's foot and was used to measure distance. How does the length of your classroom differ when measured using several students' feet?

1. Estimate the distance in feet across the classroom. Record this number in your Science Journal.
2. Walk across your classroom by placing the heel of one foot against the toes of your other foot. Count and record the number of steps in your Science Journal.
3. Measure the lengths of your two feet and average them. Calculate the distance of the classroom by multiplying the average length of your feet by the number of steps.
4. Measure the distance across the classroom using a tape measure.
5. **Think Critically** Compare the distance across the classroom using your foot with the distance using other classmates' feet. How does your calculated measurement compare to your classmates' calculated measurements and to the actual measurement?

FOLDABLES™ Study Organizer

Scientific Processes Make the following Foldable to help identify what you already know, what you want to know, and what you learned about science.

- STEP 1** Fold a sheet of paper vertically from side to side. Make the front edge about 1.25 cm shorter than the back edge.

- STEP 2** Turn lengthwise and fold into thirds.

- STEP 3** Unfold and cut only the top layer along both folds to make three tabs. Label each tab.

Identify Questions Before you read the chapter, write what you already know about science under the left tab of your Foldable, and write questions about what you'd like to know under the center tab. After you read the chapter, list what you learned under the right tab.

Scienceonline

Preview this chapter's content and activities at fl.gpscience.com

Purpose Use the Launch Lab activity to introduce students to nonstandard measuring units.

L1 ELL COOP LEARN

IS Interpersonal

Materials yardstick, tape measure
Teaching Strategy Have students estimate the length of the classroom before making any measurements. Have students work in groups.

Think Critically

Students should recognize that each person's foot will not be the same length and will give a different measurement for the classroom. The calculated measurement should be about the same because a standard measurement was used.

Assessment

Oral Have students draw cartoons that explain the limitations of the measurements they made. It is difficult to measure fractions of units accurately and to compare data from groups that use different units. Use **Performance Assessment in the Science Classroom**, p. 133.

What is science?

Science is not just a subject in school. It is a method for studying the natural world. After all, science comes from the Latin word *scientia*, which means “knowledge.” Science is a process that uses observation and investigation to gain knowledge about events in nature.

Nature follows a set of rules. Many rules, such as those concerning how the human body works, are complex. Other rules, such as the fact that Earth rotates about once every 24 h, are much simpler. Scientists ask questions to learn about the natural world.

Major Categories of Science Science covers many different topics that can be classified according to three main categories.

(1) Life science deals with living things. (2) Earth science investigates Earth and space. (3) Physical science deals with matter and energy. In this textbook, you will study mainly physical science. Sometimes, though, a scientific study will overlap the categories. One scientist, for example, might study the motions of the human body to understand how to build better artificial limbs. Is this scientist studying energy and matter or how muscles operate? She is studying both life science and physical science. It is not always clear what kind of science you are using, as shown in **Figure 1**.

Figure 1 Astronaut Michael Lopez-Alegria uses a pistol-grip tool on the *International Space Station*.

Observe What evidence do you see of the three main branches of science in the photograph?

Reading Preview

Tie to Prior Knowledge

What is science? Discuss with students what they believe science to be. Have them compare their ideas with the definition of science given in the text.

Content Specific Words Preview and discuss **Figure 3** to help students see that *experiment* is not listed on this flow-chart for the scientific method. Explain that an experiment is just one way of testing a hypothesis or a possible solution to a problem. Then, locate the six new vocabulary words related to an experiment in the text.

Science Explains Nature Scientific explanations help you understand the natural world. Sometimes these explanations must be modified. As more is learned about the natural world, some of the earlier explanations might be found to be incomplete or new technology might provide more accurate answers.

For example, look at **Figure 2**. In the late eighteenth century, most scientists thought that heat was an invisible fluid with no mass. Scientists observed that heat seems to flow like a fluid. It also moves away from a warm body in all directions, just as a fluid moves outward when you spill it on the floor.

However, the heat fluid idea did not explain everything. If heat was an actual fluid, an iron bar at a temperature of 1,000°C should have more mass than it does at 100°C because it would have more of the heat fluid in it. Eighteenth-century scientists thought they were not able to measure the small mass of the heat fluid on the balances they had. When additional investigations showed no difference in mass, scientists had to change the explanation.

Investigations Scientists learn new information about the natural world by performing investigations, which can be done many different ways. Some investigations involve simply observing something that occurs and recording the observations, such as in a journal. Other investigations involve setting up experiments that test the effect of one thing on another. Some investigations involve building a model that resembles something in the natural world and then testing the model to see how it acts. Often, a scientist will use something from all three types of investigations when attempting to learn about the natural world.

Reading Check Why do scientific explanations change?

Scientific Methods

Although scientists do not always follow a rigid set of steps, investigations often follow a general pattern. An organized set of investigation procedures is called a **scientific method**. Six common steps found in scientific methods are shown in **Figure 3**. A scientist might add new steps, repeat some steps many times, or skip steps altogether when doing an investigation.

Differentiated Instruction

English-Language Learners While science can answer many questions about how things work, what they are made of, and where things come from, it cannot answer questions that are opinion-based. Science cannot answer questions about art, politics, or literature. Science cannot

Figure 2 Many years ago, scientists thought that heat, such as in this metal rod, was a fluid.

Infer how heat acts like a fluid.

Figure 1 physical science—pistol grip tool and other instruments; Earth science—event taking place in space; life science—space suit that allows a human body to survive in space

Figure 2 It flows from one location to another.

Reading Check

Answer Scientists are constantly learning new information by performing investigations.

Visual Learning

Figure 2 Discuss with students ways scientists study heat. Point out that scientists study the structure of the materials through which heat travels, why heat travels through them, and what heat really is. **L1**

Logical-Mathematical

tell you what is right, wrong, good, or bad. Have students brainstorm both questions that science can answer and those that science cannot answer. Ask students to explain why science can answer some questions, but not others. **ELL L1**

Use an Analogy

Finding Class Ask students to describe how they found their different classrooms on the first day of school in this building. Explain that their methods are analogous to the way the scientific methods discussed in this section are used.

Use Science Words

Word Origin The word *experiment* is from the Latin word *experimen-tum*, which means “proof or test.” Have students write entries in their Science Journals explaining how the meaning of the word reflects the meaning of its root.

L2 **IS** Linguistic

Fun Fact

Experiments can be done to confirm a hypothesis about how an independent variable affects a dependent variable. They can also be done to confirm a null hypothesis. A null hypothesis states that the independent variable does not affect the dependent variable.

Discussion

Hypothesis Confirmed Why are results that do not confirm a hypothesis important? These experimental results can help scientists adjust and restate hypotheses. **L2** **IS**

Logical-Mathematical

Caption Answer

Figure 3 Form and test a new hypothesis.

Reading Strategy

Outline Have students outline this section in their Science Journals, using headings and subheadings. The title should be The Methods of Science. Tell students to write each highlighted vocabulary word in the outline and include a definition by jotting down key words or phrases from the text as they read.

Figure 3 The series of procedures shown here is one way to use scientific methods to solve a problem.

Explain what should be done if your hypothesis is not supported.

Stating a Problem Many scientific investigations begin when someone observes an event in nature and wonders why or how it occurs. Then the question of “why” or “how” is the problem. Sometimes a statement of a problem arises from an activity that is not working. Some early work on guided missiles showed that the instruments in the nose of the missiles did not always work. The problem statement involved finding a material to protect the instruments from the harsh conditions of flight.

Later, National Aeronautics and Space Administration (NASA) scientists made a similar problem statement. They wanted to build a new vehicle—the space shuttle—that could carry people to outer space and back again. Guided missiles did not have this capability. NASA needed to find a material for the outer surface of the space shuttle that could withstand the heat and forces of re-entry into Earth’s atmosphere.

Researching and Gathering Information Before testing a hypothesis, it is useful to learn as much as possible about the background of the problem. Have others found information that will help determine what tests to do and what tests will not be helpful? The NASA scientists gathered information about melting points and other properties of the various materials that might be used. In many cases, tests had to be performed to learn the properties of new, recently created materials.

Forming a Hypothesis A **hypothesis** is a possible explanation for a problem using what you know and what you observe. NASA scientists knew that a ceramic coating had been found to solve the guided missile problem. They hypothesized that a ceramic material also might work on the space shuttle.

Testing a Hypothesis Some hypotheses can be tested by making observations. Others can be tested by building a model and relating it to real-life situations. One common way to test a hypothesis is to perform an experiment. An **experiment** tests the effect of one thing on another using controlled conditions.

Cultural Diversity

Herbal Medicine Principles of science have been used to solve problems throughout the world and throughout history. In the rain forests of Central and South America, plants are used to promote healing. For thousands of years the local people have observed and tested plants and learned which

ones can be used for medicines. Today scientists from industries that specialize in manufacturing prescription drugs are working with these herbal healers to identify the materials in the plants that have medicinal value.

Variables An experiment usually contains at least two variables. A **variable** is a factor that can cause a change in the results of an experiment. You might set up an experiment to determine the amount of fertilizer that will help plants grow the biggest. Before you begin your tests, you would need to think of all the factors that might cause the plants to grow bigger. Possible factors include plant type, amount of sunlight, amount of water, room temperature, type of soil, and type of fertilizer.

In this experiment, the amount of growth is the **dependent variable** because its value changes according to the changes in the other variables. The variable you change to see how it will affect the dependent variable is called the **independent variable**.

Constants and Controls To be sure you are testing to see how fertilizer affects growth, you must keep the other possible factors the same. A factor that does not change when other variables change is called a **constant**. You might set up one trial, using the same soil and type of plant. Each plant is given the same amount of sunlight and water and is kept at the same temperature. These are constants. Three of the plants receive a different amount of fertilizer, which is the independent variable.

The fourth plant is not fertilized. This plant is a control. A **control** is the standard by which the test results can be compared. Suppose after several days, the three fertilized plants grow between 2 and 3 cm. If the unfertilized plant grows 1.5 cm, you might infer that the growth of the fertilized plants was due to the fertilizers.

How might the NASA scientists set up an experiment to solve the problem of the damaged tiles shown in **Figure 4**? What are possible variables, constants, and controls?

 **Reading Check** Why is a control used in an experiment?

Figure 4 NASA has had an ongoing mission to improve the space shuttle. A technician is replacing tiles damaged upon re-entry into Earth's atmosphere.

SECTION 1 The Methods of Science 9

Classification Systems

Through observations of living organisms, Aristotle designed a classification system. Systems used today group organisms according to variables such as habits and physical and chemical features. Research to learn recent reclassifications of organisms. Share your findings with your class.

Activity

Create a Hypothesis Organize the class into teams and give each team a large index card on which to write a problem for an experiment. Have teams exchange their cards. Each team should generate a hypothesis for the question they hold and write it on the card. Have students exchange cards with a different group. Ask each team to devise an experiment based on the question and hypothesis on the card the team now has. Students should be sure to identify the constants, independent variable, dependent variable, and control in the experiment.  **COOP LEARN**  **Logical-Mathematical**

Classification Systems The science that deals with the naming and classifying of organisms is called taxonomy. Taxonomists continually collect and analyze data, sometimes changing the way organisms are classified as a result of their findings. Fungi, for example, were classified as plants until data convinced scientists to put fungi in their own kingdom.

Text Question Answer

They might make tiles of many different materials and subject them all to the heat and other stresses encountered by the shuttle. The variables would be the materials used, the constants would be the conditions to which the tiles were subjected, and scientists could use additional tiles that are made from the same materials as the tested tiles for the controls.

 **Reading Check**

Answer A control is a standard to which test results can be compared.

Active Reading

 **ReQuest** To improve listening skills, have students listen carefully as you read the discussion of scientific methods in this section. After the reading, have students construct questions to be discussed in class. You can have students reread the section and participate in the questioning with other students.

Use Science Words

Word Meaning Some of the terms used when analyzing data are *mean*, *mode*, *median*, and *average*. These terms have slightly different meanings and can be confusing. Have students define each one. *mean*: a value that is computed by dividing the sum of a set of values by the number of values; *mode*: the most frequent value of a set of data; *median*: a value in an ordered set of values below and above which there is an equal number of values, or, if there is no one middle number, a value which is the arithmetic mean of the two middle values; *average*: same as mean. [L2] [IS]

Linguistic

Quick Demo

The Scientific Method

Material thermometer, two beakers of hot water, one stirrer, stopwatch, ice cubes

Estimated Time 15 minutes

Procedure Do ice cubes melt faster in hot water when stirred or when left untouched? Perform the steps of the scientific method out of order in front of the class. Ask students to rank the steps in the order they should have occurred. Have them explain why it makes a difference if the scientific method is performed out of order. Repeat the steps in the order the students ranked them. Ask students which way makes more sense.

Caption Answer

Figure 5 Answers may include: meetings, journals, presentations.

✓ Reading Check

Answer A bias occurs when what the scientist expects changes how the results are viewed.

Figure 5 An exciting and important part of investigating something is sharing your ideas with others, as this student is doing at a science fair. **Identify** possible methods of how scientists can share their research data.

Analyzing the Data An important part of every experiment includes recording observations and organizing the test data into easy-to-read tables and graphs. Later in this chapter you will study ways to display data. When you are making and recording observations, you should include all results, even unexpected ones. Many important discoveries have been made from unexpected occurrences.

Interpreting the data and analyzing the observations is an important step. If the data are not organized in a logical manner, wrong conclusions can be drawn. No matter how well a scientist communicates and shares that

data, someone else might not agree with the data. Scientists share their data through reports and conferences. In **Figure 5**, a student is displaying her data.

Drawing Conclusions Based on the analysis of your data, you decide whether or not your hypothesis is supported. When lives are at stake, such as with the space shuttle, you must be very sure of your results. For the hypothesis to be considered valid and widely accepted, the experiment must result in the exact same data every time it is repeated. If your experiment does not support your hypothesis, you must reconsider the hypothesis. Perhaps it needs to be revised or your experiment needs to be conducted differently.

Being Objective Scientists also should be careful to reduce bias in their experiments. A **bias** occurs when what the scientist expects changes how the results are viewed. This expectation might cause a scientist to select a result from one trial over those from other trials. Bias also might be found if the advantages of a product being tested are used in a promotion and the drawbacks are not presented.

Scientists can lessen bias by running as many trials as possible and by keeping accurate notes of each observation made. Valid experiments also must have data that are measurable. For example, a scientist performing a global warming study must base his or her data on accurate measures of global temperature. This allows others to compare the results to data they obtain from a similar experiment. Most importantly, the experiment must be repeatable. Findings are supportable when other scientists perform the same experiment and get the same results.

✓ Reading Check What is bias in science?

10 CHAPTER 1 The Nature of Science

Curriculum Connection

Language Arts Emphasize to students that being objective is important in reporting information in all areas. Have them search through magazines and newspapers and find articles in which the writer's bias has influenced the article. [L2] [IS]

Linguistic

Differentiated Instruction

Challenge When analyzing the results of many different trials, scientists use the methods of statistics. One of the most useful tools of statistics is normal distribution. Have students find out what this tool is. A normal distribution is a distribution of values that produces a symmetrical bell-shaped curve. It shows the distribution of values that results from many random variables. [L3] [IS]

Logical-Mathematical

Visualizing with Models

Sometimes, scientists cannot see everything that they are testing. They might be observing something that is too large, too small, or takes too much time to see completely. In these cases, scientists use models. A **model** represents an idea, event, or object to help people better understand it.

Models in History Models have been used throughout history. One scientist, Lord Kelvin, who lived in England in the 1800s, was famous for making models. To model his idea of how light moves through space, he put balls into a bowl of jelly and encouraged people to move the balls around with their hands. Kelvin's work to explain the nature of temperature and heat still is used today.

High-Tech Models Scientific models don't always have to be something you can touch. Today, many scientists use computers to build models. NASA experiments involving space flight would not be practical without computers. The complex equations would take far too long to calculate by hand, and errors could be introduced much too easily.

Another type of model is a simulator, like the one shown in **Figure 6**. An airplane simulator enables pilots to practice problem solving with various situations and conditions they might encounter when in the air. This model will react the way a plane does when it flies. It gives pilots a safe way to test different reactions and to practice certain procedures before they fly a real plane.

Computer Models

Meteorology has changed greatly due to computer modeling. Using special computer programs, meteorologists now are able to more accurately predict disastrous weather. In your Science Journal, describe how computer models might help save lives.

Figure 6 Pilots and astronauts use flight simulators for training. **Explain** how these models differ from actual airplanes and spacecraft.

Computer Models Journal entries should include that predictions of severe weather, such as tornadoes, hurricanes, and flooding rains, can warn residents of an area to take precautions or evacuate the area.

Activity

Studying Models Have students make posters showing situations in which models are used to study something too large to study directly, too small to be studied directly, and too dangerous to be studied directly. **Possible answers:** the solar system, which is too large to be studied directly; the tiny particles that make up matter, which are too small to be studied directly; and a plane crash, which is too dangerous to be studied directly. **L2** **IS** **Visual-Spatial**

Caption Answer

Figure 6 They don't always mimic the real situation exactly. They also don't cause any damage to people or materials when the pilot makes a mistake and crashes.

Discussion

Modeling with Computers Why are computers useful for modeling situations? Computers can slow down or speed up action and can show how a process changes over time. They also can be programmed to make predictions based on data put into them. **L2**

IS **Logical-Mathematical**

Science Journal

Universal Theories Have students investigate theories about the origin of the universe and explain why these theories are not scientific laws. **The current main theory is the Big Bang Theory. This theory is not a law because it tries to explain how or why something happens. A law simply describes a pattern.** **L2** **IS** **Logical-Mathematical**

Visual Learning

Figure 6 Ask students whether they have used a driving simulator in a video game. Ask them to explain what it taught them about driving and why it does not really equip them to drive. **The simulation might give them practice in steering, accelerating, and stopping, but it does not involve roadway experience with other cars.** **L2** **IS** **Visual-Spatial**

Inquiry Lab

The Path of Theory Development

Purpose To have students get a better grasp of the evolution of scientific knowledge and the application of scientific method.

Possible Materials index cards

Safety Precautions

- As this lab may involve social commentary, caution students to remain objective.
- Have students use topics from news items only, not from observations about events within the school or about their peers. Make a rule against 'picking on' individuals.

Estimated Time one class period

Teaching Strategies

- Have students record at least three observations about a psychological, social, or scientific phenomenon in their experience.
- Mix the cards up and have students suggest an experiment that could be done to test a hypothesis for each observation. Encourage objective discussion of the viability of each experiment suggested.
- The game can demonstrate that a hypothesis can't be proven, only disproved.
- For each hypothesis that students disprove with observations, have them create a further hypothesis. Explain that this is how real science develops.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Visit fl.gpscience.com for Web links to information about Archimedes' principle.

Activity Place a full soft-drink bottle, water bottle, or container of milk in a tub of water. What happens to the pop bottle or milk container? Would you classify Archimedes' principle as a scientific theory or scientific law?

Figure 7 Science can't answer all questions.

Analyze Can anyone prove that you like artwork? Explain.

12 CHAPTER 1 The Nature of Science

Scientific Theories and Laws

A scientific **theory** is an explanation of things or events based on knowledge gained from many observations and investigations. It is not a guess. If scientists repeat an investigation and the results always support the hypothesis, the hypothesis can be called a theory. Just because a scientific theory has data supporting it does not mean it will never change. Recall that the theory about heat being a fluid was discarded after further experiments. As new information becomes available, theories can be modified. A theory accepted today might at some time in the future also be discarded.

A **scientific law** is a statement about what happens in nature and that seems to be true all the time. Laws tell you what will happen under certain conditions, but they don't explain why or how something happens. Gravity is an example of a scientific law. The law of gravity says that any one mass will attract another mass. To date, no experiments have been performed that disprove the law of gravity.

A theory can be used to explain a law. For example, many theories have been proposed to explain how the law of gravity works. Even so, there are few theories in science and even fewer laws.

Reading Check

What is the difference between a scientific theory and a scientific law?

The Limitations of Science

Science can help you explain many things about the world, but science cannot explain or solve everything. Although it's the scientist's job to make hypotheses, the scientist also has to make sure his or her hypotheses can be tested and verified. How do you prove that people will like a play or a piece of music? You cannot and science cannot.

Most questions about emotions and values are not scientific questions. They cannot be tested. You might take a survey to get people's opinions about such questions, but that would not prove that the opinions are true for everyone. A survey might predict that you will like the art in **Figure 7**, but science cannot prove that you or others will.

Post Reading

Discussion After reading *Using Science and Technology*, take time to discuss additional scientific advances that may be controversial. Identify ethical issues that would be challenging topics for debate. Talk about personal values, ethics, and bias related to a controversial issue. How can expert scientists ignore their personal values?

Using Science—Technology

Many people use the terms *science* and *technology* interchangeably, but they are not the same. **Technology** is the application of science to help people. For example, when a chemist develops a new, lightweight material that can withstand great amounts of heat, science is used. When that material is used on the space shuttle, technology is applied.

Figure 8 shows other examples of technology.

Technology doesn't always follow science, however. Sometimes the process of discovery can be reversed. One important historic example of science following technology is the development of the steam engine. The inventors of the steam engine had little idea of how it worked. They just knew that steam from boiling water could move the engine. Because the steam engine became so important to industry, scientists began analyzing how it worked. Lord Kelvin, James Prescott Joule, and Sadi Carnot, who lived in the 1800s, learned so much from the steam engine that they developed revolutionary ideas about the nature of heat.

Science and technology do not always produce positive results. The benefits of some technological advances, such as nuclear technology and genetic engineering, are subjects of debate. Being more knowledgeable about science can help society address these issues as they arise.

Figure 8 Technology is the application of science. **Identify** the type of science (life, Earth, or physical) that is applied in these examples of technology.

✓ Reading Check

Answer A theory can change if its supporting data changes. A law is assumed to be true and doesn't change. Also, a law tells what happens but does not explain why. Theories try to explain why things happen.

Caption Answers

Figure 7 No, it cannot be tested.

Figure 8 The top picture shows applications of physical science (computer) and life science (medical image). The lower picture shows the application of physical science (instruments) and life science (measuring levels of sugar in blood).

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Review with students the scientific method. On separate sheets of paper, write the parts of the scientific method. Have students place these sheets on a chart in the correct order.

Reteach

Freezing Water Ask students to design an experiment that will determine whether hot water freezes faster than cold water does. Make sure that constants include the amount of water, the size and kind of container, the amount of time in the freezer, and the freezer used. **L2** **IS** **Logical-Mathematical**

✓ Assessment

Performance Have students design and perform an experiment to determine whether microwave popcorn pops better when it has been frozen. Have them identify constants, variables, and a control for the experiment. Use **PASC**, p. 95.

section 1 review

Summary

What is science?

- Scientists ask questions and perform investigations to learn more about the natural world.

Scientific Methods

- Scientists perform the six-step scientific method to test their hypotheses.

Visualizing with Models

- Models help scientists visualize concepts.

Scientific Theories and Laws

- A theory is a possible explanation for observations, while a scientific law describes a pattern but does not explain why things happen.

Using Science—Technology

- Technology is the application of science in our everyday lives.

Self Check

1. **Define** the first step a scientist usually takes to solve a problem.
2. **Explain** why a control is needed in a valid experiment.
3. **Think Critically** What is the dependent variable in an experiment that shows how the volume of gas changes with changes in temperature?

Applying Math

4. **Find the Average** You perform an experiment to determine how many breaths a fish takes per minute. Your experiment yields the following data: minute 1: 65 breaths; minute 2: 73 breaths; minute 3: 67 breaths; minute 4: 71 breaths; minute 5: 62 breaths. Calculate the average number of breaths that the fish takes per minute.

section 1 review

1. Identify the problem.
2. to provide a standard against which test results can be compared
3. volume of gas
4. The fish takes an average of 68 breaths per minute.

Section Focus Transparencies also are available on the Interactive Chalkboard CD-ROM.

L2 ELL

Section Focus Transparency Pick a Scale and Go with It Chapter 1

What does it mean if someone says that the temperature is thirty-two degrees? It depends entirely on the scale that they're using. Referring to a temperature of 32 might mean that it's a hot summer's day or that it's so cold that even oxygen is frozen solid.

1. Label the three pictures 32°F, 32°C, and 32 K.
2. Why must a measurement include the units in order to be meaningful?
3. What kind of units do you use to measure length? Mass?

L2

Reading Guide

★ FCAT Vocabulary

What You'll Learn

- **Name** the prefixes used in SI and indicate what multiple of ten each one represents.
- **Identify** SI units and symbols for length, volume, mass, density, time, and temperature.
- **Convert** related SI units.

Why It's Important

By using uniform standards, nations can exchange goods and compare information easily.

Review Vocabulary

measurement: the dimensions, capacity, or amount of something

New Vocabulary

- ★ **precision**
- ★ **accuracy**
- volume
- mass
- density

Units and Standards

A standard is an exact quantity that people agree to use to compare measurements. Look at **Figure 9**. Suppose you and a friend want to make some measurements to find out whether a desk will fit through a doorway. You have no ruler, so you decide to use your hands as measuring tools. Using the width of his hands, your friend measures the doorway and says it is 8 hands wide. Using the width of your hands, you measure the desk and find it is $7\frac{3}{4}$ hands wide. Will the desk fit through the doorway? You can't be sure. What went wrong? Even though you both used hands to measure, you didn't check to see whether your hands were the same width as your friend's.

Figure 9 Hands are a convenient measuring tool, but using them can lead to misunderstanding.

Precision and Accuracy

You are watching an archery event. The first person shoots five bull's-eyes in a row. The second person does not hit the bull's-eye at all, but the arrows all are in a similar location. What can be said about these two participants? The first person's aim was both precise and accurate. The second person's aim was only precise. **Precision** describes how closely measurements are to each other and how carefully measurements were made. **Accuracy** compares a measurement to the real or accepted value. When taking measurements, it is important to be precise and accurate.

Reading Preview

Tie to Prior Knowledge

Measuring Students are familiar with measurements. Ask them to name the units they commonly use to measure length, mass, volume, and density.

Visualize Focus students' attention on the review and new vocabulary words. Activate prior knowledge about length, volume, mass and density by reading together and discussing **Figure 15**, Visualizing Dimensions. Make associations between the illustrations and the concepts of volume, mass, and density.

International System of Units

In 1960, an improved version of the metric system was devised. Known as the International System of Units, this system is often abbreviated SI, from the French *Le Systeme Internationale d'Unites*. SI is an improved, accepted version of the metric system that is based on multiples of ten. It is understood by scientists throughout the world. The standard kilogram, which is kept in Sèvres, France, is shown in **Figure 10**. All kilograms used throughout the world must be exactly the same as the kilogram kept in France.

Each type of SI measurement has a base unit. The meter is the base unit of length. Every type of quantity measured in SI has a symbol for that unit. These names and symbols for the seven base units are shown in **Table 1**. All other SI units are obtained from these seven units.

SI Prefixes The SI system is easy to use because it is based on multiples of ten. Prefixes are used with the names of the units to indicate what multiple of ten should be used with the units. For example, the prefix *kilo-* means “1,000.” This means that one kilometer equals 1,000 meters. Likewise, one kilogram equals 1,000 grams. Because *deci-* means “one-tenth,” one decimeter equals one-tenth of a meter. A decigram equals one-tenth of a gram. The most frequently used prefixes are shown in **Table 2**.

Reading Check How many meters are in 1 km? How many grams are in 1 dg?

Table 1 SI Base Units

Quantity Measured	Unit	Symbol
Length	meter	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Temperature	kelvin	K
Amount of substance	mole	mol
Intensity of light	candela	cd

Table 2 Common SI Prefixes

Prefix	Symbol	Multiplying Factor
Kilo-	k	1,000
Deci-	d	0.1
Centi-	c	0.01
Milli-	m	0.001
Micro-	μ	0.000 001
Nano-	n	0.000 000 001

Figure 10 The standard for mass, the kilogram, and other standards are kept at the International Bureau of Weights and Measures in Sèvres, France. **Explain** the purpose of a standard.

Misconceptions

SI Precision Students may think that SI is more precise than the English system because scientists use it. Point out that both systems can yield equally precise measurements. For instance, a micrometer used by machinists can measure the diameters of bolts to the nearest 0.0001 inch. Scientists use SI because it is easier to use and easier to convert units. Have students measure the length of their textbook using a metric ruler and a ruler calibrated in inches. Have them compare results and note that both measurements can be precise.

Caption Answer

Figure 10 It provides an accepted and understood value for a base unit.

Reading Check

Answer 1,000; one tenth

Reading Strategy

Double-Entry Notes Ask students to take notes on this section by dividing their papers with a vertical line. Students should write bold headings in the left column. On the right side, students should include vocabulary definitions, formulas, words in italics, summaries, and responses that correlate to the headings.

Science Journal

Standards Have students record in their Science Journals the physical standards for mass, length, and time. The standard mass is the 1 kg of platinum-iridium alloy shown in **Figure 10**. The standard length, 1 meter, is defined as the distance light travels in a vacuum in 1/299,792,458 of a second. The standard time, 1 second, is defined as 9,192,631,770 periods of the radiation of cesium-133 atoms. **L3**

Differentiated Instruction

Challenge I Have students research the standardization of currency. When did it occur? Why? They can compare the need for standard units of measurement with the need for standard currency. It is believed that the first standard coins were produced in Lydia, part of present-day Turkey, in the 600s B.C. The coins were standardized so people knew the exact value of the metal pieces. **L3** **IS** Linguistic

Caption Answer

Figure 11 3.1 cm; 31 mm

Make a Model

Measurement System Model a new metric measurement system. Organize the class into groups and have each group choose an object to be the basis for its new metric standard of length. Have students make or draw models showing a unit, a decunit, a centunit, and a kilounit. **L2**

Visual-Spatial P

Figure 11 One centimeter contains 10 mm.

Determine the length of the paper clip in centimeters and in millimeters.

Converting Between SI Units Sometimes quantities are measured using different units, as shown in **Figure 11**. A conversion factor is a ratio that is equal to one and is used to change one unit to another. For example, there are 1,000 mL in 1 L, so $1,000 \text{ mL} = 1 \text{ L}$. If both sides in this equation are divided by 1 L, the equation becomes:

$$\frac{1,000 \text{ mL}}{1 \text{ L}} = 1$$

To convert units, you multiply by the appropriate conversion factor. For example, to convert 1.255 L to mL, multiply 1.255 L by a conversion factor. Use the conversion factor with new units (mL) in the numerator and the old units (L) in the denominator.

$$1.255 \text{ L} \times \frac{1,000 \text{ mL}}{1 \text{ L}} = 1,255 \text{ mL}$$

Applying Math

Math Standards

National: 4

Florida: MA.B.1.4.2

Answers to Practice Problems

1. $1 \text{ cm} = 10 \text{ mm}$
 $11 \text{ cm} \times 10 \text{ mm/cm} = 110 \text{ mm}$
2. $1 \text{ mi} = 1.6 \text{ km}$
 $20,000 \text{ mi} \times 1.6 \text{ km} = 32,000 \text{ km}$

Discussion

Measuring Day Time Point out to students that while in SI the units for time less than 1 s are divided into multiples of ten (the millisecond, nanosecond, etc.), the units for time greater than 1 s are not. Have each student devise a metric system for measuring the amount of time in a day. **Accept all responses in which time is divided into units that are multiples of ten.** **L3** **Logical-Mathematical**

Reading Check

Answer avoiding large digit numbers and numbers with many decimal places

Applying Math

Convert Units

CENTIMETERS How long in centimeters is a 3,075 mm rope?

IDENTIFY known values and the unknown value

Identify the known values:

The rope measures 3,075 mm; $1 \text{ m} = 100 \text{ cm} = 1,000 \text{ mm}$

Identify the unknown value:

How long is the rope in cm?

SOLVE the problem

This is the equation you need to use:

$$? \text{ cm} = 3,075 \text{ mm} \times \frac{100 \text{ cm}}{1,000 \text{ mm}}$$

Cancel units and multiply:

$$3,075 \text{ mm} \times \frac{100 \text{ cm}}{1,000 \text{ mm}} = 307.5 \text{ cm}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by multiplying the answer by $\frac{1,000 \text{ mm}}{100 \text{ cm}}$. Did you calculate the original length in millimeters?

Practice Problems

1. Your pencil is 11 cm long. How long is it in millimeters?
2. The Bering Land Bridge National Preserve is a summer home to birds. Some birds migrate 20,000 miles. Assume 1 mile equals 1.6 kilometers. Calculate the distance birds fly in kilometers.

For more practice problems, go to page 879 and visit Math Practice at fl.gpscience.com.

Teacher FYI

Early Measurement Early measurements were based on body parts. One of the earliest measurements ever recorded was length. The Egyptian cubit was derived from the length of the arm from the elbow to the outstretched fingertips. France's unit of length was the meter, which was defined as being one ten-

millionth part of a quarter of Earth's circumference. The production of this standard required a very careful survey to be done which took several years. As more accurate instruments became available, the standard was called into question.

Figure 12 One meter is slightly longer than 1 yard, and 100 m is slightly longer than a football field.
Predict whether your time for a 100-m dash would be slightly more or less than your time for a 100-yard dash.

Activity

Rulers Distribute metric rulers and have students identify the millimeter, centimeter, and decimeter markings on the ruler. Have them measure common objects. As they are measuring, have each student choose an object that best represents a centimeter. Allow them to make estimations and use their rulers to check their estimations. [L2]

Kinesthetic

Astronomical Units Venus is 0.72 AU from the Sun and Pluto is 39.6 AU from the Sun. 1 AU is about 1.5×10^8 km = 150,000,000 km.

Career Astronomers study objects where they cannot use all of their senses. They cannot touch or smell stars, comets, or planets other than Earth. Astronomers do need good observations skills. The majority of the astronomers do not look through telescopes. They teach and do research in colleges and universities.

Quick Demo

Accurate Measurements

Materials meterstick, tape measure, round object

Estimated Time five minutes

Purpose Use a meterstick to measure the circumference of a round object. Repeat the measurement with a metric tape measure. Ask the students to explain why the measurement made with the tape measure is more accurate. The meterstick can't bend to accurately measure the curved surface. [L1] **ELL** **IS**
Logical-Mathematical

Measuring Distance

The word *length* is used in many different ways. For example, the length of a novel is the number of pages or words it contains. In scientific measurement, length is the distance between two points. That distance might be the diameter of a hair or the distance from Earth to the Moon. The SI base unit of length is the meter, m. A baseball bat is about 1 m long. Metric rulers and metersticks are used to measure length. **Figure 12** compares a meter and a yard.

Choosing a Unit of Length As shown in **Figure 13**, the size of the unit you measure with will depend on the size of the object being measured. For example, the diameter of a shirt button is about 1 cm. You probably also would use the centimeter to measure the length of your pencil and the meter to measure the length of your classroom. What unit would you use to measure the distance from your home to school? You probably would want to use a unit larger than a meter. The kilometer, km, which is 1,000 m, is used to measure these kinds of distances.

By choosing an appropriate unit, you avoid large-digit numbers and numbers with many decimal places. Twenty-one kilometers is easier to deal with than 21,000 m, and 13 mm is easier to use than 0.013 m.

Reading Check

Why is choosing the correct unit of length important?

Figure 13 The size of the object being measured determines which unit you will measure in. A tape measure measures in meters. The micrometer, shown on the left, measures in small lengths.

State what unit you think it measures.

SECTION 2 Standards of Measurement 17

Cultural Diversity

Length Through Time Accurate length measurement was important for ancient engineering projects, such as the Nazca lines, the pyramids in Central America and Africa, and the great public buildings found in many cultures. Have students identify some of the units of length used in the ancient world. Lengths used include the cubit and the Roman mile. [L2] **IS** **Linguistic**

Visual Learning

Figure 12 Discuss with students the difference between a meter and a yard. Measure the distance across the classroom or blackboard in both meters and yards and make sure students understand the measurements. Review with students how to convert meters into yards.

Activity

Relative Volume Provide a number of irregularly-shaped containers and a graduated cylinder. Have each student make a hypothesis about the relative volumes of the containers and write down the hypothesis. Then have students test their hypotheses by measuring the volume of each container. Tell them to fill each container completely with water, pour the water into the graduated cylinder, and measure the amount the container held. **L2** **KS** **Kinesthetic**

Caption Answer

Figure 14 1,000 cm³ are in 1 dm³.

Science Online

Topic: International System of Units

Visit fl.gpscience.com for Web links to information about the International System of Units.

Activity Measure four different things in your classroom using a different unit—distance, volume, time, or temperature—for each. Use each unit only once. Write the measurements down and using the common prefixes in Table 2, convert them to different units.

Measuring Volume

The amount of space occupied by an object is called its **volume**. If you want to know the volume of a solid rectangle, such as a brick, you measure its length, width, and height and multiply the three numbers and their units together ($V = l \times w \times h$). For a brick, your measurements probably would be in centimeters. The volume would then be expressed in cubic centimeters, cm³. To find out how much a moving van can carry, your measurements probably would be in meters, and the volume would be expressed in cubic meters, m³, because when you multiply, you add exponents.

Measuring Liquid Volume How do you measure the volume of a liquid? A liquid has no sides to measure. In measuring a liquid's volume, you are indicating the capacity of the container that holds that amount of liquid. The most common units for expressing liquid volumes are liters and milliliters. These are measurements used in canned and bottled foods. A liter occupies the same volume as a cubic decimeter, dm³. A cubic decimeter is a cube that is 1 dm, or 10 cm, on each side, as in **Figure 14**.

Look at **Figure 14**. One liter is equal to 1,000 mL. A cubic decimeter, dm³, is equal to 1,000 cm³. Because 1 L = 1 dm³, it follows that

$$1 \text{ mL} = 1 \text{ cm}^3$$

Sometimes, liquid volumes such as doses of medicine are expressed in cubic centimeters.

Suppose you wanted to convert a measurement in liters to cubic centimeters. You would use conversion factors to convert L to mL and then mL to cm³.

$$1.5 \text{ L} \times \frac{1,000 \text{ mL}}{1 \text{ L}} \times \frac{1 \text{ cm}^3}{1 \text{ mL}} = 1,500 \text{ cm}^3$$

Figure 14 The large cube has a volume of 1 dm³, which is equivalent to 1 L. **Calculate** the cubic centimeters (cm³) in the large cube.

Curriculum Connection

Math Have students find and record the equations for determining the volumes of shapes such as a cylinder, sphere, square pyramid, and cone. The equation for calculating the volume of a cylinder is $\pi r^2 h$. The equation for the volume of a sphere is $\frac{4}{3} \pi r^3$. The equation

for the volume of a square pyramid is $\frac{1}{3} bh$. The equation for the volume of a cone is $\frac{1}{3} \pi r^2 h$. **L3**

KS **Logical-Mathematical**

Table 3 Densities of Some Materials at 20°C

Material	Density (g/cm ³)	Material	Density (g/cm ³)
Hydrogen	0.000 09	Aluminum	2.7
Oxygen	0.001 4	Iron	7.9
Water	1.0	Gold	19.3

Measuring Matter

A table-tennis ball and a golf ball have about the same volume. But if you pick them up, you will notice a difference. The golf ball has more mass. **Mass** is a measurement of the quantity of matter in an object. The mass of the golf ball, which is about 45 g, is almost 18 times the mass of the table-tennis ball, which is about 2.5 g. To visualize SI units, see **Figure 15** on the following page.

Density A cube of polished aluminum and a cube of silver that are the same size not only look similar but also have the same volume. The mass and volume of an object can be used to find the density of the material the object is made of. **Density** is the mass per unit volume of a material. You find density by dividing an object's mass by the object's volume. For example, the density of an object having a mass of 10 g and a volume of 2 cm³ is 5 g/cm³. **Table 3** lists the densities of some familiar materials.

 **Reading Check** How is density determined?

Derived Units The measurement unit for density, g/cm³, is a combination of SI units. A unit obtained by combining different SI units is called a derived unit. An SI unit multiplied by itself also is a derived unit. Thus the liter, which is based on the cubic decimeter, is a derived unit. A meter cubed, expressed with an exponent—m³—is a derived unit.

Measuring Time and Temperature

It is often necessary to keep track of how long it takes for something to happen, or whether something heats up or cools down. These measurements involve time and temperature.

Time is the interval between two events. The SI unit for time is the second. In the laboratory, you will use a stopwatch or a clock with a second hand to measure time.

Determining the Density of a Pencil

Procedure   

1. Find a pencil that will fit in a 100-mL graduated cylinder below the 90-mL mark.
2. Measure the mass of the pencil in grams.
3. Put 90 mL of water (initial volume) into the 100-mL graduated cylinder. Lower the pencil, eraser first, into the cylinder. Push the pencil down until it is just submerged. Hold it there and record the final volume to the nearest tenth of a milliliter.

Analysis

1. Determine the water displaced by the pencil by subtracting the initial volume from the final volume.
2. Calculate the pencil's density by dividing its mass by the volume of water displaced.
3. Is the density of the pencil greater than or less than the density of water? How do you know?

Purpose Students measure the mass and volume of a pencil and use these data to find its density.

   **Logical-Mathematical**

Materials water, 100-mL graduated cylinder, unsharpened pencil, balance

Teaching Strategy The mass measurement should be made using a dry pencil.

Analysis

1. Students should use the equation $d = m/v$. Remind them that 1 mL = 1 cm³.
2. Check students' paper.
3. Because the pencil floats, its density is less than that of water. Also, its calculated density is less than that of water—1.0.

Assessment

Performance Have students use the same procedure to test the density of another object such as a cork or a rubber stopper. If possible, they could compare their results with the density given in **Table 3** on this page or another density table. Use **Performance Assessment in the Science Classroom**, p. 97.

 **Reading Check**

Answer divide mass by volume

Curriculum Connection

Math The SI prefix *pico-* is used for tiny measurements. The diameter of a hydrogen nucleus is about 78 picometers. Have students find out what *pico-* means and find the diameter of a hydrogen atom in meters. The prefix means one-trillionth. A hydrogen atom has a diameter of 78 trillionths (78×10^{-12}) of a meter.   **Logical-Mathematical**

Differentiated Instruction

Behaviorally Disordered Have these students read through the lab a day or two before the class does it. Show them how it works and ask whether they have any questions. Make sure they understand the purpose of the water. When they do the lab, pair them with students who work well in the lab.

Visualizing SI Dimensions

Have students examine the pictures and read the captions. Then ask the following questions.

In what units would you measure your height? **meters** The distance a runner covered in a marathon? **kilometers** The mass of a pencil? **grams**

Why wouldn't you measure the distance from Dallas, Texas to Miami, Florida in millimeters? **The number of millimeters would be an extremely large number, too big to be able to visualize.** What unit should you use? **kilometers**

Activity

Different Measurements Set up three stations and allow groups to rotate through them. One station should have a balance and several objects that students can mass. Another station should have several containers of liquids and a graduated cylinder so they can measure volumes. The third station should have a metric ruler and meterstick and several objects whose lengths students can determine. Have students measure the objects and compare their measurements when all have finished. **L1**

LS Kinesthetic

Figure 15

The characteristics of most of these everyday objects are measured using an international system known as SI dimensions. These dimensions measure length, volume, mass, density, and time. Celsius is not an SI unit but is widely used in scientific work.

MILLIMETERS A dime is about 1 mm thick.

METERS A football field is about 91 m long.

KILOMETERS The distance from your house to a store can be measured in kilometers.

LITERS This carton holds 1.98 L of frozen yogurt.

MILLILITERS A teaspoonful of medicine is about 5 mL.

GRAMS/METER This stone sinks because it is denser—has more grams per cubic meter—than water.

GRAMS The mass of a thumbtack and the mass of a textbook can be expressed in grams.

METERS/SECOND The speed of a roller-coaster car can be measured in meters per second.

CELSIUS Water boils at 100°C and freezes at 0°C.

Differentiated Instruction

Challenge Have students find the high temperature for the day in Fahrenheit, Celsius, and Kelvin. They can obtain the temperature, probably in Fahrenheit, from a weather report. Have them use the following equations: $C = 5(F - 32)/9$; $C + 273 = K$. **L3** **LS**
Logical-Mathematical

Post Reading

Creating Charts After reading the section on time and temperature, have students make a chart that shows Fahrenheit, Celsius, and Kelvin temperatures for the boiling point of water (212°F), an extremely hot day (100°F), a perfect day (72°F), a chilly day (45°F), a freezing day (32°F) and dangerously cold days (0°F).

What's Hot and What's Not You will learn the scientific meaning of the word *temperature* in a later chapter. For now, think of temperature as a measure of how hot or how cold something is.

Look at **Figure 16**. For most scientific work, temperature is measured on the Celsius (C) scale. On this scale, the freezing point of water is 0°C, and the boiling point of water is 100°C. Between these points, the scale is divided into 100 equal divisions. Each one represents 1°C. On the Celsius scale, the average human body temperature is 37°C, and a typical room temperature is between 20°C and 25°C.

Kelvin and Fahrenheit The SI unit of temperature is the kelvin (K). Zero on the Kelvin scale (0 K) is the coldest possible temperature, also known as absolute zero. Absolute zero is equal to -273°C, which is 273° below the freezing point of water.

Most laboratory thermometers are marked only with the Celsius scale. Because the divisions on the two scales are the same size, the Kelvin temperature can be found by adding 273 to the Celsius reading. So, on the Kelvin scale, water freezes at 273 K and boils at 373 K. Notice that degree symbols are not used with the Kelvin scale.

The temperature measurement you are probably most familiar with is the Fahrenheit scale, which was based roughly on the temperature of the human body, 98.6°.

Figure 16 These three thermometers illustrate the scales of temperature between the freezing and boiling points of water. **Compare** the boiling points of the three scales.

Reading Check What is the relationship between the Celsius scale and the Kelvin scale?

Caption Answer

Figure 16 The boiling point of water is 373 K, 100°C, and 212°F.

Reading Check

Answer The units are the same size, but zero on the Kelvin scale is 273 units lower than zero on the Celsius scale.

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Being able to convert between SI units is important in understanding how scientists operate on a daily basis. Have students measure various objects in centimeters. Then have students convert from centimeters to meter, from meter to kilometer, and centimeter to kilometer.

Reteach

Have each student calculate his or her mass in kilograms. Tell students that at Earth's surface, an object weighing 1 pound has a mass of 0.45 kg. **Sample:** A student weighing 120 pounds has a mass of 54 kg. **L2** **IS** **Logical-Mathematical**

Assessment

Performance Have students develop their own standards and units for measuring time. Have them evaluate their units in terms of how easy it is to replicate results using their standards. Use PASC, p. 117.

section 2 review

Summary

Precision and Accuracy

- Precision is the description of how close measurements are to each other.

International System of Units

- The International System of Units, or SI, was established to provide a standard of measurement and reduce confusion.
- Conversion factors are used to change one unit to another and involve using a ratio equal to 1.

Measuring

- The size of an object being measured determines which unit you will measure in.

Self Check

- Explain** why it is important to have exact standards of measurement.
- Explain** why density is a derived unit.
- Think Critically** Using a metric ruler, measure a shoe box and a pad of paper. Find the volume of each in cubic centimeters. Then convert the units to mL.

Applying Math

- Convert Units** Make the following conversions: 27°C to Kelvin, 20 dg to milligrams, and 3 m to decimeters.
- Calculate Density** What is the density of an unknown metal that has a mass of 158 g and a volume of 20 mL? Use **Table 3** to identify this metal.

More Section Review fl.gpscience.com

Communicating with Graphs

1 Motivate

An editable Microsoft® PowerPoint® presentation is available on **Interactive Chalkboard** CD-ROM.

Bellringer

Section Focus Transparencies also are available on the Interactive Chalkboard CD-ROM.

L2 ELL

Section Focus Transparency Data by Graph

Sometimes the best way to communicate information is with a graph. Circle graphs are a good way to show the parts of a whole—in this case, the U.S. population by age.

United States Population by Age

Age Group	Percentage
0-14 years	21%
15-64 years	66%
65 years and older	13%

- What information does the circle graph provide? Could you have obtained that information by looking at the photograph?
- How else could you display these data?
- Would it be useful to list all the people in the U.S. along with their ages? Why or why not?

L2

Reading Guide

What You'll Learn

- **Identify** three types of graphs and explain the ways they are used.
- **Distinguish** between dependent and independent variables.
- **Analyze** data using the various types of graphs.

Why It's Important

Graphs are a quick way to communicate a lot of information in a small amount of space.

Review Vocabulary

data: information gathered during an investigation or observation

New Vocabulary

- graph

A Visual Display

Scientists often graph the results of their experiments because they can detect patterns in the data easier in a graph than in a table. A **graph** is a visual display of information or data. **Figure 17** is a graph that shows a girl walking her dog. The horizontal axis, or the *x*-axis, measures time. Time is the independent variable because as it changes, it affects the measure of another variable. The distance from home that the girl and the dog walk is the other variable. It is the dependent variable and is measured on the vertical axis, or *y*-axis.

Graphs are useful for displaying numerical information in business, science, sports, advertising, and many everyday situations. Different kinds of graphs—line, bar, and circle—are appropriate for displaying different types of information.

Figure 17 This graph tells the story of the motion that takes place when a girl takes her dog for an 8-min walk.

✓ Reading Check What are three common types of graphs?

Graphs are useful for displaying numerical information in business, science, sports, advertising, and many other everyday situations. Graphs make it easier to understand complex patterns by displaying data in a visual manner. Scientists often graph their data to detect patterns that would not have been evident in a table. Different graphs use different methods for displaying information. The conclusions drawn from graphs must be based on accurate information and reasonable scales.

Reading Preview

Tie to Prior Knowledge

Finding Graphs Assign students to find graphs in newspapers and magazines and bring them to class. Have student groups develop a classification system for the graphs. L1 AS Interpersonal

Charts and Graphs Preview the text and identify types of graphs and illustrations in this section. Ask “Have you ever used or seen any others types of graphs?” Students may think of picture graphs and coordinate graphs. Have students talk about the differences between a chart and a graph.

Reading Check

Answer line, bar, and circle graphs

Caption Answer

Figure 18 thermostat A

Discussion

Interpolation v. Extrapolation

Explain to students that interpolation is reading graph values between data points, and extrapolation is reading graph values beyond data points. Ask students which process is likely to produce more error. **Extrapolation; it goes beyond what has actually been measured in an experiment.** L3 LS

Logical-Mathematical

Activity

Graphing Have students look in the newspaper for information that can be presented as graphs. Have each student explain why they chose that particular graph. Examples can be weather data, motor vehicle ads, or sports statistics.

Reading Strategy

Summarize Ask students to write a summary sentence in their Science Journals after studying the line graph in **Figure 18**, the bar graph in **Figure 20**, and the circle graph in **Figure 21**. Have students compare their summary statements.

Table 4 Room Temperature

Time*	Classroom Temperature (C°)		
	A	B	C
0	16	16	16
5	17	17	16.5
10	19	19	17
15	20	21	17.5
20	20	23	18
25	20	25	18.5

*minutes after turning on heat

Figure 18 The room temperatures of classrooms A, B, and C are shown in contrast to the thermostat setting of 20°C.

Identify the thermostat that achieved its temperature setting the quickest.

The break in the vertical axis between 0 and 15 means that numbers in this range are left out. This leaves room to spread the scale where the data points lie, making the graph easier to read.

Visual Learning

Figure 18 Have students practice interpolation (finding data between reference points) and extrapolation (finding data past the range of the reference points) by examining the data provided. Ask them what they would expect the temperature to be in the classroom using thermostat A after 8 min and after 30 min. 18°C and 20°C L3

ELL LS Visual-Spatial

Differentiated Instruction

Challenge Graphs are not always a completely objective presentation of data. Graphs are frequently used in advertising to conceal or distort data. Ask students to think of ways that information could be emphasized or underplayed on a graph. **A stretched-out vertical scale would emphasize highs and lows. A compressed vertical scale would conceal them.** L2 ELL LS Logical-Mathematical

Quick Demo

Data Tables

Materials none

Estimated Time ten minutes

Purpose Use students' clothing or shoes to demonstrate how to make a data table. For example, you could collect data such as shoe type, shoe color, sleeve length, or clothing type. After completing the data table, complete a bar graph of the information. Reinforce the idea that a bar graph rather than a line graph would be used because a line graph must contain two sets of numbers, while a bar graph can use categories. **L2**

ELL **LS** Visual-Spatial

Applying Math

Math Standards

National: 1, 2, 5, 9

Florida: MA.D.1.4.1

Answer to Practice Problem

1. Students could use either bar graphs or line graphs to represent this data. In either case, running time should be on the y-axis and year should be on the x-axis.
2. Check students' work.
3. The difference in time is 1.2h.
% Improvement =
 $1.2 \text{ h} / 5.2 \text{ h} \times 100 = 23.1\%$

Teacher FYI

Charts and Graphs The earliest surviving chart, an illustration of the orbits of the planets over time, dates back to the tenth century. The art of charting and graphing didn't appear again until the 18th century with the introduction of the modern economics graph by William Playfair.

Figure 19 Graphing calculators are valuable tools for making graphs.

Constructing Line Graphs Besides choosing a scale that makes a graph readable, as illustrated in **Figure 18**, other factors are involved in constructing useful graphs. The most important factor in making a line graph is always using the *x*-axis for the independent variable. The *y*-axis always is used for the dependent variable. Because the points in a line graph are related, you connect the points.

Another factor in constructing a graph involves units of measurement. For example, you might use a Celsius thermometer for one part of your experiment and a Fahrenheit thermometer for another. But you must first convert your temperature readings to the same unit of measurement before you make your graph.

In the past, graphs had to be made by hand, with each point plotted individually. Today, scientists use a variety of tools, such as computers and graphing calculators like the one shown in **Figure 19**, to help them draw graphs.

Applying Math

Make and Use Graphs

TEMPERATURE In an experiment, you checked the air temperature at certain hours of the day. At 8 A.M., the temperature was 27°C; at noon, the temperature was 32°C; and at 4 P.M., the temperature was 30°C. Graph the results of your experiment.

IDENTIFY known values

time = independent variable, which is the *x*-axis

temperature = dependent variable, which is the *y*-axis

GRAPH the problem

Graph time on the *x*-axis and temperature on the *y*-axis. Mark the equal increments on the graph to include all measurements. Plot each point on the graph by finding the time on the *x*-axis and moving up until you find the recorded temperature on the *y*-axis. Place a point there. Continue placing points on the graph. Then connect the points from left to right.

Practice Problems

As you train for a marathon, you compare your previous times. In year one, you ran it in 5.2 h; in year two, you ran it in 5 h; in year three, you ran it in 4.8 h; in year four, you ran it in 4.3 h; and in year five, you ran it in 4 h.

1. Make a table of your data.
2. Graph the results of your marathon races.
3. Calculate your percentage of improvement from year one to year five.

For more practice problems, go to page 879 and visit Math Practice at fl.gpscience.com.

Science Journal

Birth Months Take a class survey of the month in which each student's birthday occurs and tally these data on the board. Have students record this information in their Science Journals. Ask each student to make both a bar graph and a circle graph to show the information. **L2** **LS** **Logical-Mathematical** **P**

Differentiated Instruction

Learning Disabled Have students conduct a survey in class to determine how many of their peers walk to class, how many ride a bike, get a ride, and take the bus. After students gather their data, have them determine which graph will best display the data. Why did they choose that particular graph? What made the other graphs a bad choice?

Bar Graphs

A bar graph is useful for comparing information collected by counting. For example, suppose you counted the number of students in every classroom in your school on a particular day and organized your data as in **Table 5**. You could show these data in a bar graph like the one shown in **Figure 20**. Uses for bar graphs include comparisons of oil or crop productions, costs, or data in promotional materials. Each bar represents a quantity counted at a particular time, which should be stated on the graph. As on a line graph, the independent variable is plotted on the *x*-axis and the dependent variable is plotted on the *y*-axis.

Recall that you might need to place a break in the scale of the graph to better illustrate your results. For example, if your data were 1,002, 1,010, 1,030, and 1,040 and the intervals on the scale were every 100 units, you might not be able to see the difference from one bar to another. If you had a break in the scale and started your data range at 1,000 with intervals of ten units, you could make a more accurate comparison.

Reading Check Describe possible data where using a bar graph would be better than using a line graph.

Mini LAB

Graphing Temperature Change

Procedure

1. Add 1-c of cold water to a medium-sized plastic bowl. Add 1/2 c of ice to the water. Put 2 tbs of table salt into the iced water.
2. Fill a clear-plastic cup 2/3 full with room temperature water. Measure the temperature of the water using a thermometer. Place the plastic cup with the thermometer into the bowl of iced water. Make sure the iced water surrounds the liquid in the cup. Do not allow any iced water into the cup.
3. Measure and record the temperature every 30 s for 5 min.

Analysis

1. Identify the dependent and independent variables.
2. Make a line graph of the data recorded in step 3.

Mini LAB

Purpose Students measure the change in temperature over time and graph the data.

L1 ELL IS Visual-Spatial

Materials cold water, room-temperature water, table salt, medium-size plastic bowl, clear-plastic cup, alcohol thermometer, graph paper, timer with second hand

Teaching Strategy Show students how to estimate a reading between marks on the thermometer.

Analysis

1. dependent variable—temperature; independent variable—time
2. Check students' work. The graph will show decreasing temperature as time increases. The slope of the line would be negative.

Assessment

Process Have students sketch a graph of what they would observe if they heated the water in an open container. The graph will show increasing temperature as time increases. The slope of the line would be positive.

Reading Check

Answer Answers will vary but might include the number of points scored by the local football team for each game of the season.

LAB DEMONSTRATION

Purpose to show students how to draw circle graphs

Preparation Write the following data on the board: Of the people who attended a play, 42 were under 10 years old; 27 were ages 11 to 20, and 11 were over 21.

Procedure Determine what percentage of the

whole each part represents (percentage = part ÷ whole × 100%). For those under 10, this is $42/80 \times 100\% = 52\%$. A circle contains 360°. To find the number of degrees needed to show each percentage, change the percentage to a decimal number and multiply it by 360°. For those under 10, $360^\circ \times 0.52 = 187^\circ$.

Assessment

What percentage of the audience were ages 11 to 20? $\frac{27}{80} \times 100\% = 34\%$ from 11 to 20 Over 21? $\frac{11}{80} \times 100\% = 14\%$ How many degrees of the circle graph are required for each of these groups? $360^\circ \times 0.34 = 122^\circ$ from 11 to 20; $360^\circ \times 0.14 = 50^\circ$ over 21

Check for Understanding

Logical-Mathematical Tell students that four students scored a D on a test, ten scored a C, seven scored a B, and four scored an A. Have each student make a bar graph and a circle graph of the data. **L2**

Reteach

Candle Wicks Stick ten birthday cake candles in holders in a long piece of plastic foam. Light the second candle and let it burn for only 5 s. Light the remaining candles in turn, letting the third candle burn for 10 s, the fourth for 15 s, etc. Remove the candles from the holders, clip their wicks, and place them side-by-side, bases aligned, on an overhead projector. Discuss with students what the silhouette displays. **L2**

Visual-Spatial

Heating Fuel Usage

Figure 21 A circle graph shows the different parts of a whole quantity.

Calculate the angle of gas usage.

Circle Graphs

A circle graph, or pie graph, is used to show how some fixed quantity is broken down into parts. The circular pie represents the total. The slices represent the parts and usually are represented as percentages of the total.

Figure 21 illustrates how a circle graph could be used to show the percentage of buildings in a neighborhood using each of a variety of heating fuels. You easily can see that more buildings use gas heat than any other kind of heating fuel system. What else does the graph tell you?

To create a circle graph, you start with the total of what you are analyzing. There are 72 buildings in the neighborhood. For each type of heating fuel, you divide the number of buildings using each type of fuel by the total (72). You then multiply that decimal by 360° to determine the angle that the decimal makes in the circle. Eighteen buildings use steam. Therefore, $(18 \div 72) \times 360^\circ = 90^\circ$ on the circle graph. You then would measure 90° on the circle with your protractor to show 25 percent.

When you use graphs, think carefully about the conclusions you can draw from them. You want to make sure your conclusions are based on accurate information and that you use scales that help make your graph easy to read.

section 3 review

Summary

A Visual Display

- Graphs are a visual representation of data.
- Scientists often graph their data to detect patterns.
- The type of graph used is based on the conclusions you want to identify.

Line Graphs

- A line graph shows how a relationship between two variables changes over time.

Bar Graphs

- Bar graphs are best used to compare information collected by counting.

Circle Graphs

- A circle graph shows how a fixed quantity is broken down into parts.

Self Check

1. **Identify** the kind of graph that would best show the results of a survey of 144 people where 75 ride a bus, 45 drive cars, 15 carpool, and 9 walk to work.
2. **State** which type of variable is plotted on the x-axis and which type is plotted on the y-axis.
3. **Explain** why the points in a line graph are connected.
4. **Think Critically** How are line, bar, and circle graphs similar? How are they different?

Applying Math

5. **Percentage** In a survey, it was reported that 56 out of 245 people would rather drink orange juice in the morning than coffee. Calculate what percentage of a circle graph this data would occupy.

section 3 review

1. bar graph
2. The independent variable is shown on the x-axis and the dependent variable is shown on the y-axis.
3. Points are connected because they are related.
4. All three graphs are used to display data. A line graph shows relationships between two vari-

ables. A bar graph can be used to compare information. A circle graph can be used to show percentages.

5. 22.9%

MA.E.1.4.3

Assessment

Performance Have students find a graph in a newspaper or a magazine. Identify the kind of graph and explain what the graph shows. Use **PASC**, p. 113.

What's my graph?

You have heard that a picture is worth a thousand words. For scientists, it is also true that a graph is worth a thousand numbers. Graphs give us a visual display of data collected during experiments. Graphs are also useful in the world of business, sports, and other situations.

Real-World Problem

How are line, bar, and circle graphs used for analyzing different kinds of data?

Goals

- **Compare and contrast** the three different types of graphs and how they are used.
- **Distinguish** between dependent and independent variables.

Materials

Science Journal pencil
small ruler compass
protractor *circle template

*Alternate material

Procedure

1. Copy the data tables into your Science Journal. Examine the data listed in the tables.
2. **Discuss** with other students the type of graph to be used for each data table.
3. **Graph** the data for each table in your Science Journal.

Data Table 2 Motion of an Object

Time (s)	Distance (m)
0	0
5	3
10	6
15	9

Data Table 3 Average Number of tornadoes by month

Month	Average # of Tornadoes
March	53
April	107
May	176
June	168
July	94

Conclude and Apply

1. **Explain** why you chose the type of graph you made for each data table.
2. **Define** the independent and dependent variables.
3. **Discuss** the advantages of looking at a graph instead of just looking at numbers in a data table.

Communicating Your Data

As a class, compare the type of graph made for each data table.

Data Table 1 Home Energy Use

Type of Energy Use	Percentage
Heating and Cooling	44%
Water Heating	14%
Refrigerator	9%
Light Cooking and Other	33%

Assessment

Performance Give students data to determine the proper graph to use. Have them explain why they selected the graph they used. Use **Performance Assessment in the Science Classroom**, p. 111.

Communicating Your Data

Have students gather and plot data of local interest.

**BENCH
TESTED**

Real-World Problem

Purpose Students demonstrate how line, bar, and circle graphs are used for analyzing different kinds of data.

Process Skills analyze results, classify, communicate, design, draw and label, interpret data, list, make and use graphs, organize data, summarize, record

Time Required one class period.

Alternate Material circle template for circle graph

Procedure

Teaching Strategy Have students discuss and debate their selection of graph type for the three data tables. Have students work independently when making their graphs.

Conclude and Apply

1. Circle graph: shows total percentage is broken down by parts. Line graph: shows change in relationship of a variable over time. Bar graph: compares information collected by counting.
2. For the line graph choice, time is the independent variable and distance is the dependent variable.
3. Visual image can be used to quickly analyze data.

► Real-World Problem

Purpose Students will design and carry out an experiment to show the necessary components of an acceptable measurement system. **L1** **COOP LEARN**

IS Interpersonal

Process Skills measure, collect and organize data, make and use tables, separate and control variables, communicate, form operational definitions, make models, use numbers, classify, observe and infer

Time Required one class period to brainstorm; one-half to one class period to complete the activity and summarize results

Materials Have various colors of string available.

► Form a Hypothesis

Possible Hypothesis Students may hypothesize that using a defined measurement standard will make it possible for other students to measure objects consistently.

► Test Your Hypothesis

Possible Procedures Choose an object such as a piece of chalk, a paper clip, or a book as the standard. Mark the units on the string with a marker or tape. Try several different-sized scale divisions of the base unit to measure halves, quarters, and tenths of units.

Developing a Measurement System

► Real-World Problem

To develop the International System of Units, people had to agree on set standards and basic definitions of scale. If you had to develop a new measurement system, people would have to agree with your new standards and definitions. In this lab, your team will use string to devise and test its own SI (String International) system for measuring length. What are the requirements for designing a new measurement system using string?

► Form a Hypothesis

Based on your knowledge of measurement standards and systems, form a hypothesis that explains how exact units help keep measuring consistent.

► Test Your Hypothesis

Make a Plan

1. As a group, agree upon and write out the hypothesis statement.
2. As a group, list the steps that you need to take to test your hypothesis. Be specific, describing exactly what you will do at each step.
3. Make a list of the materials that you will need.

Goals

- **Design** an experiment that involves devising and testing your own measurement system for length.
- **Measure** various objects with the string measurement system.

Possible Materials

string
scissors
marking pen
masking tape
miscellaneous objects for standards

Safety Precautions

28

Alternative Inquiry Lab

Real-World Connection Have students research and discuss why other standards in science are necessary. Examples include graphing rules, writing in pen in permanently bound laboratory notebooks (the debacle of the Cold Fusion experiments is a good illustration), and standards in experimental procedures and reporting format.

Researching the history of standards of measurement in antiquity also can be fascinating. Possible topics include the precision of the construction of the Egyptian pyramids, geometry, astronomy, and monolithic construction, the ancient Chinese, the Mayans, the ancient Muslim scientists, and units for trade and barter.

Using Scientific Methods

4. **Design** a data table in your Science Journal so it is ready to use as your group collects data.
5. As you read over your plan, be sure you have chosen an object in your classroom to serve as a standard. It should be in the same size range as what you will measure.
6. Consider how you will mark scale divisions on your string. Plan to use different pieces of string to try different-sized scale divisions.
7. What is your new unit of measurement called? Come up with an abbreviation for your unit. What will you name the smaller scale divisions?
8. What objects will you measure with your new unit? Be sure to include objects longer and shorter than your string. Will you measure each object more than once to test consistency? Will you measure the same object as another group and compare your findings?

Follow Your Plan

1. Make sure your teacher approves your plan before you start.
2. Carry out the experiment as it has been planned.
3. **Record** observations that you make and complete the data table in your Science Journal.

Analyze Your Data

1. **Explain** which of your string scale systems will provide the most accurate measurement of small objects.
2. **Describe** how you recorded measurements that were between two whole numbers of your units.

Conclude and Apply

1. **Explain** why, when sharing your results with other groups, it is important for them to know what you used as a standard.
2. **Infer** how it is possible for different numbers to represent the same length of an object.

Communicating Your Data

Compare your conclusions with other students' conclusions. Are there differences? Explain how these may have occurred.

LAB 29

Assessment

Portfolio Have students tape a sample of their measuring string to an explanation of their standard and measuring system. Then have them write about any problems they solved in the process of developing this system. Students should include this paper in their portfolio. Use **Performance Assessment in the Science Classroom**, p. 159.

Communicating Your Data

To test their measurement systems, have students exchange strings and use them to measure the same item.

Teaching Strategy Use heavy string to make handling easy. Be sure metersticks and other standard measuring devices are not available to students. Encourage students to use common classroom objects as standards.

Expected Outcome Students will devise and test a measuring system that other groups can use to make consistent measurements. They may encounter errors due to stretching of the string and estimating between units.

Discussion Discuss with students that measurements between two marked units will include one estimated digit. Different people using the same measuring device will be more likely to get the same measurement if the scale divisions are small. The ability to measure and get the same answer is called precision.

Analyze Your Data

1. the system with the smallest divisions, because it is the most precise
2. The final digit was estimated.

Error Analysis Have students analyze how errors could result from the method used to mark their string into smaller units.

Conclude and Apply

1. so they can reproduce your results
2. When the size of the unit of measurement varies, the number of units used to measure an object also must vary.

Understanding Literature

Identifying the Main Head Possible answer: The main idea of this selection is that thinking in pictures—has allowed Temple Grandin to solve design problems as an equipment designer.

Answers to Questions

1. They think in pictures.
2. photographs at the cow's eye level
3. kites and model airplanes
4. **Linking Science and Writing** Remind students that maps and pictures can be models as well as three-dimensional objects.

Modeling The design and use of models can help people predict the characteristics of any system. Because a model can be built, tested, and modified at a reasonably low cost, scientists, architects, and other designers use models to predict the performance of a prototype. If the results obtained from a model are to be applicable to the prototype, a strict set of conditions must be met by the model or the deviations from these conditions must be considered when predicting the behavior of the prototype.

Thinking in Pictures: and other reports from my life with autism¹

By Temple Grandin

Temple Grandin is an animal scientist and writer who also happens to be autistic. People with autism are said to think in pictures.

I think in pictures. Words are like a second language to me. I translate both spoken and written words into full-color movies, complete with sound, which run like a VCR tape in my head. When somebody speaks to me, his words are instantly translated into pictures. Language-based thinkers often find this phenomenon difficult to understand, but in my job as equipment designer for the livestock industry, visual thinking is a tremendous advantage.

... I credit my visualization abilities with helping me understand the animals I work with. Early in my career I used a camera to help give me the animals' perspective as they walked through a chute for their veterinary treatment. I would kneel down and take pictures through the chute from the cow's eye level. Using the photos, I was able to figure out which things scared the cattle.

Every design problem I've ever solved started with my ability to visualize and see the world in pictures. I started designing things as a child, when I was always experimenting with new kinds of kites and model airplanes.

¹ Autism is a complex developmental disability that usually appears during the first three years of life. Children and adults with autism typically have difficulties in communicating with others and relating to the outside world.

Understanding Literature

Identifying the Main Idea The most important idea expressed in a paragraph or essay is the main idea. The main idea in a reading might be clearly stated, but sometimes the reader has to summarize the contents of a reading in order to determine its main idea. What do you think is the main idea of the passage?

Respond to the Reading

1. How do people with autism think differently from other people?
2. What did the author use to see from a cow's point of view?
3. What did the author use for models to design things when she was a child?
4. **Linking Science and Writing** Research the use of a scientific model. Write a paragraph stating the main ideas and listing supporting details.

Models enable scientists to see things that are too big, too small, or too complex. Scientists might build models of DNA, airplanes, or other equipment. Temple Grandin's visual thinking and ability to make models enable her to predict how things will work when they are put together.

Unraveling the Mystery of Autism and Pervasive Development Disorder: A Mother's Story of Research and Recovery, by Karyn Seroussi and Bernard Rimland Ph.D., Simon & Shuster, 2000

Reviewing Main Ideas

Section 1 The Methods of Science

1. Science is a way of learning about the natural world, such as the hurricane shown below, through investigation.

2. Scientific investigations can involve making observations, testing models, or conducting experiments.
3. Scientific experiments investigate the effect of one variable on another. All other variables are kept constant.
4. Scientific laws are repeated patterns in nature. Theories attempt to explain how and why these patterns develop.

Section 2 Standards of Measurement

1. A standard of measurement is an exact quantity that people agree to use as a basis of comparison. The International System of Units, or SI, was established to provide a standard and reduce confusion.
2. When a standard of measurement is established, all measurements are compared to the same exact quantity—the standard. Therefore, all measurements can be compared with one another.

3. The most commonly used SI units include length—meter, volume—liter, mass—kilogram, and time—second.
4. Any SI unit can be converted to any other related SI unit by multiplying by the appropriate conversion factor. These towers are 45,190 cm in height, which is equal to 451.9 m.
5. Precision is the description of how close measurements are to each other. Accuracy is comparing a measurement to the real or accepted value.

Section 3 Communicating with Graphs

1. Graphs are visual representations of data that make it easier for scientists to detect patterns.
2. Line graphs show continuous changes among related variables. Bar graphs are used to show data collected by counting. Circle graphs show how a fixed quantity can be broken into parts.
3. To create a circle graph, you have to determine the angles for your data.
4. In a line graph, the independent variable is always plotted on the horizontal x -axis. The dependent variable is always plotted on the vertical y -axis.

FOLDABLES™ Use the Foldable that you made at the beginning of this chapter to help you review scientific processes.

Assessment

Assessment Transparency The Nature of Science 1

Directions: Carefully review the tables and answer the following questions.

Time (s)	Approximate Speed (m/s)	Time (s)	Approximate Speed (m/s)
0	0	6	80
1	10	7	70
2	20	8	80
3	30	9	90
4	40	10	100
5	50	11	?

1. The above data were collected during an experiment to find out the speed of an object dropped from a tall building. Which type of graph would be the best way to display this information?
 A bar graph C circle graph
 B pie graph D line graph
2. According to these data, about how fast would the object be dropping after 11 seconds?
 F 90 m/s H 110 m/s
 G 100 m/s I 120 m/s
3. An independent variable is the factor that affects the measure of the other variable. What independent variable could have been added to this experiment?
 A time C height
 B speed D graph

L2

FOLDABLES™ Have students use the Foldables that they made at the beginning of the chapter to help them review scientific processes.

Using Vocabulary

1. accuracy
2. volume
3. technology
4. mass
5. dependent variable
6. graph
7. experiment
8. constant
9. density
10. hypothesis

Checking Concepts

11. C
12. D
13. C
14. D
15. A
16. B
17. D

Interpreting Graphics

18. Independent variable: pot;
constant: vegetables; ingredients;
dependent variable: heat required,
iron content, taste, cooking time
19. See student page.

Thinking Critically

20. Possible answer: The next king's arm would be a different length.
21. Possible advantages: SI is based on powers of 10 conversion is easy because the same prefixes are used for all types of measurements most countries use it. Possible disadvantages: Conversion to SI would be expensive; people are reluctant to change from a familiar system.
22. Bias occurs when a scientist's expectations about the experiment change how he views the results. Running multiple trials, keeping accurate records of measurable data, and designing experiments that can be repeated reduces bias and helps validate data.

SC.H.1.4.4, SC.H.2.4.2

Using Vocabulary

- accuracy p. 14
 bias p. 10
 constant p. 9
 control p. 9
 density p. 19
 dependent variable p. 9

 precision p. 14
 scientific law p. 12
 scientific method p. 7
 technology p. 13
 theory p. 11
 variable p. 9
 volume p. 18

FCAT Vocabulary

Match each phrase with the correct term from the list of vocabulary words.

1. comparing a measurement to the real or accepted value
2. the amount of space occupied by an object
3. application of science to help people
4. the amount of matter in an object
5. a variable that changes as another variable changes
6. a visual display of data
7. a test set up under controlled conditions
8. a variable that does NOT change as another variable changes
9. mass per unit volume
10. an educated guess using what you know and observe

Checking Concepts

Choose the word or phrase that best answers the question.

11. Which question CANNOT be answered by science?
 - A) How do birds fly?
 - B) How does a clock work?
 - C) Is this a good song?
 - D) What is an atom?

32 CHAPTER REVIEW

12. Which is an example of an SI unit?
 - A) foot
 - B) gallon
 - C) pound
 - D) second

13. One one-thousandth is expressed by which prefix?

- A) centi-
- B) kilo-
- C) milli-
- D) nano-

14. What is SI based on?

- A) English units
- B) inches
- C) powers of five
- D) powers of ten

15. What is the symbol for deciliter?

- A) dL
- B) dcL
- C) dkL
- D) Ld

16. Which is NOT a derived unit?

- A) dm^3
- B) m
- C) cm^3
- D) g/mL

17. Which is NOT equal to 1,000 mL?

- A) 1 L
- B) 100 cL
- C) 1 dm^3
- D) 1 cm^3

Interpreting Graphics

Use the photo below to answer question 18.

18. Define The illustrations above show the items needed for an investigation. Which item is the independent variable? Which items are the constants? What might a dependent variable be?

Vocabulary PuzzleMaker fl.gpscience.com

Use the ExamView® Pro Testmaker CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

- 19. Concept Map** Copy and complete this concept map on scientific methods.

Thinking Critically

- 20. Communicate** Standards of measurement used during the Middle Ages often were based on such things as the length of the king's arm. How would you go about convincing people to use a different system of standard units?
- 21. Analyze** What are some advantages and disadvantages of adopting SI in the United States?
- 22. Identify** when bias occurs in scientific experimentation. Describe steps scientists can take to reduce bias and validate experimental data.

- 23. Demonstrate** Not all objects have a volume that is measured easily. If you were to determine the mass, volume, and density of your textbook, a container of milk, and an air-filled balloon, how would you do it?
- 24. Apply** Suppose you set a glass of water in direct sunlight for 2 h and measure its temperature every 10 min. What type of graph would you use to display your data? What would the dependent variable be? What would the independent variable be?
- 25. Form a Hypothesis** A metal sphere is found to have a density of 5.2 g/cm^3 at 25°C and a density of 5.1 g/cm^3 at 50°C . Form a hypothesis to explain this observation. How could you test your hypothesis?
- 26. Compare and contrast** the ease with which conversions can be made among SI units versus conversions among units in the English system.

Applying Math

- 27. Convert Units** Make the following conversions.
- A) 1,500 mL to L C) 5.8 dg to mg
B) 2 km to cm D) 22°C to K
- 28. Calculate the density** of an object having a mass of 17 g and a volume of 3 cm^3 .

Use the illustration below to answer question 29.

- 29. Solve** Find the dimensions of the box in centimeters. Then find its volume in cubic centimeters.

Thinking Critically

- 23.** Textbook volume could be determined by multiplying its length, width, and height. The volume of the balloon could be determined by measuring the volume of water it displaces. The volume of any irregular object, such as the milk carton, must be determined indirectly. If the object is not harmed by water, volume can be measured by water displacement.
- 24.** A line graph; time would be the independent variable and temperature would be the dependent variable.
- 25.** The metal expands when heated. The hypothesis can be tested by measuring the volume of the ball at the two temperatures.
- 26.** SI measurements are based on powers of ten. There are many different divisions in the English system. Thus, it is easier to convert in SI than in the English system.

Applying Math

Math Standards

National: 1, 2, 4, 9

Florida: MA.1.4.1, MA.B.2.4.1, MA.D.2.4.1

- 27. a.** 1.5 L
b. 200,000 cm
c. 580 mg
d. 295 K
- 28.** $D = \frac{m}{v}$
 $m = 17 \text{ g} \quad v = 3 \text{ cm}^3$
 $D = \frac{17 \text{ g}}{3 \text{ cm}^3} = 5.67 \text{ g/cm}^3$
- 29.** 0.4 m = 40 cm;
0.2 m = 20 cm;
0.7 m = 70 cm
 $v = \text{length} \times \text{width} \times \text{height}$
 $v = 40 \text{ cm} \times 70 \text{ cm} \times 20 \text{ cm}$
 $= 56,000 \text{ cm}^3$

- Interactive Chalkboard

6. Convert 615 mg to grams.

- A. 0.00615 g
- B. 0.615 g
- C. 6.15 g
- D. 61.5 g

7. What does the symbol *ns* represent?

- A. microsecond
- B. millisecond
- C. nanosecond
- D. picosecond

Gridded Response

8. Calculate the volume of the cube shown.

Short Response

9. Describe several ways scientists use investigations to learn about the natural world.

10. Why do scientists use graphs when analyzing data?

Extended Response

11. You must decide what items to pack for a hiking and camping trip. Space is limited, and you must carry all items during hikes. What measurements are important in your preparation?

12. What is the standard unit shown in this illustration? Why is it kept under cover in a vacuum-sealed container?

13. Define the term *technology*. Identify three ways that technology makes your life easier, safer, or more enjoyable.

14. Describe the three major categories into which science is classified. Which branches of science would be most important to an environmental engineer? Why?

15. A friend frequently misses the morning school bus. Use the scientific method to address this problem.

Extended Response

11. The length, width, and height of the packing areas help determine which items will fit in which spaces. The volume or total amount of space in the duffel bag and car also determine the items which will fit into each. Mass is important, as massive objects which must be carried on hikes will be difficult to manage.

12. This is the kilogram, the standard for mass. It is covered in a vacuum-sealed container to prevent any erosion or corrosion with air, and to keep airborne materials from settling on it, changing its mass.

13. Technology is the application of science to help people. Examples of technology are nearly limitless, but may be grouped into categories including medical tools, equipment designed for entertainment, modes of transportation, or home appliances.

14. Life science deals with living things, Earth science with Earth and space, and physical science with matter and energy. An environmental engineer would be connected with all three branches. For example, he might study how heat and waste materials emitted by an industrial plant (physical science) affect the air, water, and soil (Earth Science) and living organisms (life science) near the plant.

15. *The Problem:* Your friend misses the morning school bus. *Gather information:* Learn about the time and location of the bus' arrival and the morning routines in the home. *Possible hypothesis:* Your friend should wake earlier, lay her clothes out the night before, or leave the house earlier in order to make the bus. *Test hypotheses, analyze data, and conclude:* Test each hypothesis several times over different mornings. If your friend consistently catches the bus, you can conclude that the hypothesis tested was supported.

Short Response

9. A scientist may make and record observations about something that is taking place. She might set up an experiment or build a model, run tests, and gather data about her observations.

10. It is easier to detect patterns when examining data in graph form than chart form.

Rubrics

Section Focus

Section Focus Transparency **Air Traffic Controller** **Chapter 2**

The air traffic control system is a vast network of people and equipment that ensures the safe operation of commercial and private aircraft. Air traffic controllers coordinate the movements of air traffic to cross certain that planes stay a safe distance apart. Your immediate concern is safety, but controllers also must direct planes efficiently to minimize delays. Some regulate airport traffic, others regulate flights between airports.

1. What are the four types of technology indicated in this picture?
2. What is the difference between science and technology?

L2

Section Focus Transparency **Three Mile Island Nuclear Generating Station** **Chapter 2**

On March 28, 1979, a nuclear reactor near Harrisburg, Pennsylvania, suffered a partial core meltdown. Unlike the meltdown at a hospital, in this case, the meltdown was caused by a failure in the system that circulates water in the reactor. The event caused a loss of confidence in the nuclear power industry and led to a reevaluation of nuclear power.

1. When you look at the picture of the Three Mile Island nuclear power plant, what do you think the accident at Three Mile Island had on the development of nuclear power in the United States?
2. Can you think of any disadvantages of nuclear power?
3. What are the advantages of nuclear power?

L2

Section Focus Transparency **Challenger Space Shuttle** **Chapter 2**

On Jan. 28, 1986, the space shuttle Challenger exploded with seven crew members aboard. The explosion on the \$1.2 billion shuttle came at one minute, 15 seconds after launch when the shuttle was about 1.5 miles high and was moving at 1,000 mph. The shuttle was launched on the 25th anniversary of the first flight of the Challenger. The shuttle was the first of the Space Shuttle program, which was launched by NASA in 1981.

1. On February 1, 2003 NASA lost another shuttle when the shuttle Columbia was launched. What do you think the cause of the problem was?
2. What are the advantages of the design of the Challenger and the design of a commercial jumbo jet? Why are the designs different?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Assessment Transparency **Science, Technology, and Society** **Chapter 2**

Directions: Use the information in the graphic organizer to answer the questions.

1. What percent of the population of the United States is female and is between the ages of 25 to 29?
 - A. 25 percent
 - B. 20 percent
 - C. 15 percent
 - D. 10 percent
2. Which country has the greatest proportion of individuals older than 60?
 - A. United States
 - B. United States and Germany
 - C. Germany
 - D. Germany and the United States
3. Which country is likely to have the greatest proportion of individuals aged 15 to 24?
 - A. United States
 - B. Germany
 - C. Germany and the United States
 - D. United States and Germany

Directions: Use the information in the graphic organizer to answer the questions.

1. What percent of the population of the United States is female and is between the ages of 25 to 29?
2. Which country has the greatest proportion of individuals older than 60?
3. Which country has the greatest proportion of school-age children?
4. Which country is most likely to have a population that is decreasing every year?
5. Which country is likely to be spending the largest proportion of its total income on elementary education?
6. Which country is likely to be spending the largest proportion of its total income on retirement benefits?

L2

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.
- COOP LEARN** Cooperative Learning activities are designed for small group work.
- MS** Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.
- P** These strategies represent student products that can be placed into a best-work portfolio.
- PBL** Problem-Based Learning activities apply real-world situations to learning.

Hands-on Activities

Student Text Lab Worksheet

Student Text Lab Worksheet **Technological Systems** **Chapter 2**

Lab Preview

Directions: Use the information in the graphic organizer to answer the questions.

Key World Problem:

Materials:

- Graph paper
- Scissors
- Glue
- Markers

Procedure:

1. Draw a large rectangle on graph paper.
2. Divide the rectangle into four equal squares.
3. Label the squares: Design, Technology, Society, and Environment.
4. Write a problem in the Design square.
5. Write a solution in the Technology square.
6. Write the impact in the Society square.
7. Write the impact in the Environment square.

L2

Chapter Review

Name: _____	Date: _____	Class: _____
Chapter 1 Science, Technology, and Society		
Part A: Vocabulary Review		
Directions: Match the term in Column 1 with the definition in Column 2. Write the letter of the correct term in the blank at the end.		
Column 1 	Column 2 	
_____ 1. A material that is made of a polymer, often with metal	a. composite	
_____ 2. The process by which a substance is broken down into smaller parts	b. degradation	
_____ 3. A material that is made of a polymer, often with metal	c. composite	
_____ 4. The process by which a substance is broken down into smaller parts	d. degradation	
Part B: Concept Review		
Directions: Answer the questions in brief, using the space provided.		
1. What are some examples of a material that is made of a polymer? _____ _____ _____		
2. What are some examples of a material that is made of a composite? _____ _____ _____		
3. What are some examples of a material that is made of a metal? _____ _____ _____		
4. What are some examples of a material that is made of a ceramic? _____ _____ _____		
5. What are some examples of a material that is made of a glass? _____ _____ _____		
6. What are some examples of a material that is made of a plastic? _____ _____ _____		
7. What are some examples of a material that is made of a rubber? _____ _____ _____		
8. What are some examples of a material that is made of a wood? _____ _____ _____		
9. What are some examples of a material that is made of a stone? _____ _____ _____		
10. What are some examples of a material that is made of a metal? _____ _____ _____		
11. What are some examples of a material that is made of a plastic? _____ _____ _____		
12. What are some examples of a material that is made of a rubber? _____ _____ _____		
13. What are some examples of a material that is made of a wood? _____ _____ _____		
14. What are some examples of a material that is made of a stone? _____ _____ _____		
15. What are some examples of a material that is made of a metal? _____ _____ _____		
16. What are some examples of a material that is made of a plastic? _____ _____ _____		
17. What are some examples of a material that is made of a rubber? _____ _____ _____		
18. What are some examples of a material that is made of a wood? _____ _____ _____		
19. What are some examples of a material that is made of a stone? _____ _____ _____		
20. What are some examples of a material that is made of a metal? _____ _____ _____		
21. What are some examples of a material that is made of a plastic? _____ _____ _____		
22. What are some examples of a material that is made of a rubber? _____ _____ _____		
23. What are some examples of a material that is made of a wood? _____ _____ _____		
24. What are some examples of a material that is made of a stone? _____ _____ _____		
25. What are some examples of a material that is made of a metal? _____ _____ _____		
26. What are some examples of a material that is made of a plastic? _____ _____ _____		
27. What are some examples of a material that is made of a rubber? _____ _____ _____		
28. What are some examples of a material that is made of a wood? _____ _____ _____		
29. What are some examples of a material that is made of a stone? _____ _____ _____		
30. What are some examples of a material that is made of a metal? _____ _____ _____

Chapter Tests

[illegible]

Science Content Background

Science and Technology Understanding Science and Technology

Many students do not understand the connection between science and technology. Science usually is the practice of learning new scientific information about how the natural world works. For example, finding the virus that causes a particular strain of influenza is considered science. Technology is the use of science to solve a human need or solve a problem. Finding a vaccine for a particular strain of influenza is an example of technology.

History and Scientific Achievements

History is full of examples of how science led to a better understanding of why something occurs. For example, influenza has caused many deaths through the centuries. A pandemic during the 1918-1919 flu season caused about 20 million deaths worldwide. Now scientists are able to isolate the specific virus that causes a particular strain of flu and make a vaccine for it. Flu outbreaks still occur, but the number of deaths has dropped dramatically since the process for developing flu vaccines has been developed.

This example shows how science and technology go hand-in-hand. The scientific discovery of finding the virus that causes a strain of flu was the scientific information needed for the technology of the vaccine to be developed.

Types of Technology

It is important for students to understand that there are many different types of technology. The term technology is a universal term that encompasses many different things. Technology can be an object, a method of doing a task, the skill needed to perform a task, or a system that includes all of the other types of technology.

This airplane pilot is sitting in an airplane that is a technological object. She has the technological skills needed to operate this aircraft. The act of going from one location to another by airplane is technology. She also is part of a system of transportation that is considered technology.

Forces that Shape Technology Technology and Society

Developments in technology often are driven by society. In the example of the flu vaccine, the needs of society fueled the scientific search for the cause of flu which ultimately led to the vaccine. Members of society are not always in agreement in the value of scientific research. Controversial scientific investigations are hotly debated by people on both sides of the issue. Some scientific investigations, such as stem-cell research, are strictly regulated. Other types of research, particularly those that involve human subjects, are forbidden by law. Society can demand that scientific research and technology be pursued or they can demand that research stop.

Developing Technology

Methods

Scientists and engineers do not develop technology in a haphazard fashion. They use methods similar to the scientific method in their development process. Many professionals from the fields of science, engineering, and business work together to produce products that are marketable, safe, reliable, and environmentally friendly.

Product Protection

Intellectual property such as new technology is legally protected by patent laws. Patent laws give companies exclusive rights to manufacture their products without unfair competition from other companies. These laws give companies the opportunity to recover the investment costs in developing the new product.

Peas in a Pod

What looks like peas in a pod are actually carbon atoms inside a tube also made of carbon atoms. The width of the tube is less than one billionth the width of a human hair! Advancements in technology allow scientists to view and create these small-scale systems.

Science Journal List 10 types of technology you have used today.

36

Theme Connection

Science and Technology Science and technology are interdependent. Advances in technology often are the result of advances in science. Advances in science often are accomplished because there is a need for new technology.

About the Photo

Nanotechnology The photo is a computer model of carbon atoms in the shaped of buckyballs inserted into a nanotube made from carbon atoms. Discovered in 1991, carbon nanotubes are 100 times stronger and six times lighter than steel and have the potential to revolutionize science and technology. Nanotechnology is expected to affect everything from how doctors treat diseases to how engineers design cars.

Start-Up Activities

Technology in Your Life

You probably do not think about how technology affects your life. You use many types of technology every day without realizing it. How much technology do you use?

1. Make a list of everything that you do from the time that you get home from school until you go to bed.
2. Circle the items on the list that involve some type of technology.
3. Select two of the items and identify the technologies involved in the item. For example, the technologies involved in a television may be the wiring or the wave that transports the signal.
4. **Thinking Critically** Write a list of activities that you could do after school if none of the technologies that you listed were available.

FOLDABLES™ Study Organizer

Science and Technology Make the following Foldable to help organize information about science and technology.

STEP 1 Fold a sheet of paper vertically in half from top to bottom.

STEP 2 Fold in half from side to side with the fold at the top.

STEP 3 Unfold the paper once. Cut only the fold of the top flap to make two tabs.

STEP 4 Turn the paper vertically and label the flaps *Science* and *Technology*.

Read for Main Ideas As you read the chapter, list the characteristics of science and technology under the appropriate flap.

Science online

Preview this chapter's content and activities at

Purpose Use this launch lab to demonstrate to students the abundance of technology that surrounds them.

Preparation Have students make a list of their activities the day before this lab.

Materials Science Journal, pencil

Teaching Strategy

- Ask student volunteers to give definitions for science and technology.
- After students have completed this lesson, have them look at their activities and see if they should make changes.

Think Critically

Possible answers: read a book, go for a walk, play outdoors, visit a friend

Assessment

Oral Ask students how would life differ if the medical technology that we have today were not available? Possible answer: The conditions would be similar to those of the Middle Ages and earlier. Many infants and children would die of childhood diseases and the life expectancy of adults would be much lower. Use **Performance Assessment in the Science Classroom**, p. 91.

Motivate

An editable Microsoft® PowerPoint® presentation is available on Interactive Chalkboard CD-ROM.

Section Focus Transparencies also are available on the Interactive Chalkboard CD-ROM.

L2 ELL

Reading Guide

What You'll Learn

- Discuss how the study of science leads to a better understanding of natural events.
- Describe the different types of technology.
- Explain why the value of technology may differ for different people and at different times.

Why It's Important

Science provides information, insight, and analytical skills to help people understand the possible causes and effects of natural events.

Review Vocabulary

technology: the application of science to help people

New Vocabulary

- agricultural biotechnology

Scientific Discovery

The study of science usually leads to a better understanding of the world around you. For example, some scientists in the Middle Ages believed that the plague was spread by breathing “bad air”. Doctors wore protective clothing to protect themselves, as shown in **Figure 1**. Various measures were taken by local doctors to rid homes of this “bad air” in an attempt to stop the plague. History is full of breakthroughs in science that have changed the course of human history. One such breakthrough is the discovery that microorganisms cause illnesses and disease. Before the mid-1800s, people had no idea that microorganisms caused many human illnesses. Many diseases were easily passed from person to person because people had no idea why the disease was spreading.

In the mid-1800s, Louis Pasteur, a French scientist, discovered the cause of most infectious diseases. He informed the public that microorganisms brought about infections and diseases. Knowing how infectious diseases spread, Alexandre Yersin, a bacteriologist, traveled to Hong Kong. A plague epidemic was underway. He was hoping to isolate the bacteria that caused this disease. In 1894, Yersin was able to isolate the microbe that caused the disease. Once scientists discovered what was causing the disease, they could focus on how the disease spread through the population. It took another four years before scientists discovered that fleas spread this microbe to humans.

Figure 1 Physicians in the Middle Ages treated people who had the plague. The beak in the protective mask contains a mixture of materials to filter the “bad air.” **Contrast** the methods used to help prevent the spread of diseases during the Middle Ages against methods used today.

Scientific Insight

Once scientists found the source of the plague, scientists brought the information to the public's attention. The information provided an explanation of why the plague occurred. Outbreaks of the plague took place throughout history. One outbreak in the 14th century killed approximately one-fourth of the population of Europe. When people clearly understood why the disease was spreading, actions could be taken to stop the disease.

Disease Prevention Today The fact that microbes spread illnesses is not news today. Young children are taught to wash their hands before eating. Restrooms contain water, soap, and towels to use to prevent the spread of microbes. Sterile band-aids, cleansers, and medicines are sold in stores for use on injuries to prevent infection. Doctors and hospitals use sterile instruments for each patient to prevent the spread of disease. These measures are taken now because we know how contagious diseases are spread from person to person and what causes infections in wounds.

Weather Forecasting Scientific insight also is used in many other ways, including weather forecasting. If you had lived in the 1800s, you only could have guessed the type of weather that was approaching by looking at the sky. Today, meteorologists use a variety of specialized instruments to predict the weather. Their instruments can detect approaching conditions that are dangerous. With advance warning, people can seek shelter or leave areas that are threatened by violent weather. **Figure 2** demonstrates the importance of forecasting dangerous weather conditions.

Science has changed the way people respond to natural events, such as the spread of microbes and hazardous weather. The study of science can lead to an understanding of why a natural process occurs. Once there is a clear understanding, people learn how to respond to the event and try to control the outcome.

✓ Reading Check

What is another example of science being used to change people's behavior?

Figure 2 In 1900, a hurricane struck Galveston, Texas, killing about 8,000 people. Today early-warning systems alert people of an approaching storm, which saves many lives.

Identify *a type of hazardous weather that occurs in your area that requires an early-warning system.*

Caption Answer

Figure 1 During the Middle Ages, people did not know about washing their hands, covering their mouths, or clean and sterilize medical instruments. In order to prevent diseases today, people are vaccinated. Medical instruments are sterilized.

2 Teach

Discussion

Disease Prevention What are additional examples of things that are done to prevent the spread of illnesses and diseases? **Accept all reasonable responses.**

What are additional examples of science giving people insight into why or how something occurs? **Accept all reasonable responses.**

✓ Reading Check

Answer Possible answers: seat belts in vehicles, car seats for infants

Caption Answer

Figure 2 Possible answers: tornadoes, floods, thunderstorms with lightning and hail

Curriculum Connection

History Before satellites and radar, people used observations of nature to predict the weather. They did not know why things happened, but they noted patterns. For example, they knew rain often follows a halo around the moon. Have students research other weather folklore and make posters describing what they find.

Reading Strategy

Double-Entry Notes Ask students to create a two-column chart as they read the text under the headings Scientific Insight and What is Technology? In the left column, they should take specific notes from the text, focusing on main ideas. In the right column, they should record comments, opinions, and sketches.

Mini LAB

Purpose Students will discover that many technological advances have occurred in recent years.

Materials Science Journal, pen or pencil.

Teaching Strategy Encourage students to spend time writing thoughtful questions.

Analysis

Check students' responses.

Assessment

Content Have students search for contrasting photographs that depict technology in the past and the technology of today. For example, students may find a photograph of someone writing a letter or sending a telegraph. The other photograph could be of someone using a cell phone or email. Use **Performance Assessment in the Science Classroom**, p. 89.

✓ Reading Check

Answer Possible answers: transistor radio, electric lamp, digital thermometer, electric toaster, microwave oven

Caption Answer

Figure 3 technological methods or techniques

Mini LAB

Researching the Past

Procedure

1. Prepare at least five questions to ask a senior citizen about technology when he or she was a teenager.
2. Perform the interview.
3. Write the responses to your questions in your **Science Journal**.

Analysis

Compare and contrast at least five differences in technology between then and now.

What is technology?

The terms *science* and *technology* often are used interchangeably. However, these terms have very different definitions. Science is an exploration process. Scientific processes are used to gain knowledge to explain and predict natural occurrences. Scientists often pursue scientific knowledge for the sake of learning new information. There may or may not be a plan to use the knowledge.

When scientific knowledge is used to solve a human need or problem, as shown in **Figure 3**, the result is referred to as technology. Technology is the application of scientific knowledge of materials and processes to benefit people. Given this definition, is an aspirin tablet technology? Is a car technology? What about the national highway system? Although these examples appear to be very different, they all represent examples of technology. Technology can be:

- any human-made object (such as a radio, computer, or pen),
- methods or techniques for making any object or tool (such as the process for making glass or ceramics),
- knowledge or skills needed to operate a human-made object (such as the skills needed to pilot an airplane), or
- a system of people and objects used to do a particular task (such as the Internet, which is a system to share information).

Technological Objects? The value of a technological object changes through time. What is considered technology today might be considered an antique tomorrow. For example, special feathers called quills were used long ago to write with ink. The quill pen was the height of technology for over one thousand years. Then, in the middle of the nineteenth century, metallic pens and writing points came into use. The modern ballpoint pen was not widely used until the 1940s.

✓ Reading Check

What are five additional objects that are considered technology?

Figure 3 This figure shows technology. This image is a technological object. The knowledge needed to create and interpret this image is technology.

Identify the technologies used to make a car.

Differentiated Instruction

English-Language Learners Have ELL students create a poster showing different types of technology. The poster should have something to represent a technological object, method or technique, knowledge or skill, and a technological system.

Figure 4 Technology changes through time. As new scientific knowledge and techniques are learned, the processes used to create objects change.

Identify another process used to create objects that has changed through time.

Technological Methods or Techniques Just as writing instruments have changed through time, so have techniques for performing various tasks. **Figure 4** shows the results of how the techniques for making books have changed. Long ago, people would sit for hours copying each page of a book by hand. They used whatever writing materials were available during that time. Books were expensive and bought only by the very rich. Today, books can be created in different ways. They can be made on a computer, printed with a computer printer, and bound with a simple machine. Modern printing presses are used to produce the majority of books used today, including your textbook.

The methods used to print books have changed through time. Each technique is technology. Other techniques that characterize technology are using a compact disc to store information, using a refrigerator to preserve food, and using email to correspond with friends.

Technological Knowledge or Skills Technology also can be the knowledge or skills needed to perform a task. For example, computer skills are needed to use the software that is used to make books and other documents. Printing press operators must use their skills to print books successfully. Anytime a complex machine is used to perform a task, technological skills must be used by the operator.

Technological Systems A network of people and objects that work together to perform a task also is technology. One example of this technology is the Internet. The Internet is a collection of computers and software that is used to exchange information. A technological system is a collection of the other types of technology that are combined to perform a specific function. The airline industry is an example of technological systems. This industry is a collection of objects, methods, systems, knowledge, and procedures. The airports, pilots, fuel, and ticketing process form a technology system that is used to move people and goods.

Activity

Technology Have students look in a library for copies of scientific journals such as *Nature*, *Discover*, *Scientific American*, or *Popular Science*. Have them write a paragraph describing three scientific achievements and three technological achievements. Have students share their paragraphs with the class. **P**

Quick Demo

Types of Technology

Materials a computer.

Estimated Time 5 minutes

Procedure Use a desktop or laptop computer as something that represents all types of technology. Point out the following information to students. The computer represents a technological object. The use of the computer to calculate grades is an example of a new method or technique for doing something. The knowledge or skill that the teacher has to use the computer represents a knowledge or skill needed to operate a human-made object. Using the computer to communicate with other people in the school system about grades, class schedules, etc. represents a technological system.

Caption Answer

Figure 4 Possible answer: Tools used to be handmade by a single person, now they are manufactured on assembly lines in a factory.

Visual Learning

Figure 4 Johannes Guttenberg, an artisan and inventor, modernized the printing of books. His invention, known as the Guttenberg press, remained the standard until the twentieth century. The printing press was a wooden frame that contained a series of blocks. Each block had

a single raised letter on its face. Ink was then rolled over the blocks where the letters were transferred to a sheet of paper. Guttenberg's invention allowed the price of printed materials to drop which meant that more people could afford books.

Fun Fact

The library in ancient Alexandria, Egypt held most of the ancient writings of its time. It is thought to have had 500,000 volumes or rolls and an annex containing another 43,000 volumes. Many ancient works have survived to modern times because of this great library.

✓ Reading Check

Answer Possible answers: inexpensive portable water filtration systems and inexpensive electrical generation systems

Global Technological Needs

The example of how books were made explained how technology has changed through the ages. The value of technology may differ for different people and at different times. The technology that is valued in the United States is not necessarily valued in other parts of the world. The needs for technology are different in developing and industrialized countries.

Developing Countries The people of some countries work hard for basic needs such as food, shelter, clothing, safe drinking water, and health care. For example, the Kenyan family shown in **Figure 5** lives without electricity and running water in their home. Health care is limited for many families in Africa. The lack of health care results in a life expectancy for rural Kenyans to be in the mid-forties. Tropical diseases, as well as infection by the human immunodeficiency virus (HIV) are a severe problem. In addition, droughts often cause shortages of food supplies in some parts of this country.

Technological solutions in developing countries focus on supplying basic needs for these families. Technology that would supply adequate and safe drinking water and food supplies would be valued. Increasing the accessibility of basic health care would improve the quality of life and increase the life expectancy in developing countries. The technology valued by rural people contrast with the technology valued by people in industrialized Kenyan cities.

✓ Reading Check

What are two examples of technology that would be valued in developing countries?

Figure 5 The technological needs of this Kenyan family center around providing the basic needs for survival, such as provisions for safe water and food supplies, health care, education, and a safe environment in which to live and work.

Industrialized Countries The United States is considered an industrialized country. Technology gives people the ability to clean polluted waters. Improving the quality of the food supply is also valued. But the level of urgency and focus appears to differ in developing countries. Most areas of the United States have adequate and safe water and food supplies. Most homes have electricity and running water. Quality health care is available to many people. The life expectancy of Americans is the late-seventies.

Look at the home in **Figure 6** and compare it to the home shown on the previous page. Does one of the homes have more technology? Look at the materials used to build each home. The materials used to build the home in **Figure 6** are technology, too.

Because the needs for survival are met in industrialized nations, money often is spent on technology. Technology is designed to improve the quality of life of individuals. Most homes in the United States contain many different types of technology, including computers, telephones, and televisions. People living in industrialized countries may value faster and faster computers. They may value small devices such as compact discs that store large amounts of information. Advances in health care can improve the quality of life due to the ability to cure diseases. Money is spent on such medical procedures as cosmetic surgery to remove wrinkles, and eye surgery so that a person no longer has to wear glasses.

Contrasting Needs

As you can see, the human needs for developing and industrialized countries are very different. Both developing and industrialized countries value technologies that supply basic human needs as discussed in **Figure 7**. The actual technology required in each country may be very different.

Figure 6 The basic needs for survival are available in industrialized nations. In these countries, value is placed on technology that improves the quality of life such as devices that make tasks easier and devices that provide entertainment.

Describe three technological objects that you value that would be of less value to the Kenyan family on the previous page. Explain your answers.

IDENTIFYING

Misconceptions

Africa Students may think that all the inhabitants of Africa live in rural areas like those shown in Figure 5. Africa is a diverse continent that contains large, modern cities, as well as rural, undeveloped areas.

Caption Answer

Figure 6 Possible answers: portable compact disc player, DVD player, or television; There is no electrical power available and they cannot afford to purchase batteries for these items.

Cultural Diversity

Contributions from Africa Egypt, which is located in Northern Africa, was the location of one of the greatest civilizations in history. Ancient Egyptians built the great pyramids, compiled a vast library in

Alexandria, and built a thriving economy. Have students research the contributions to the world made by ancient Egyptians.

Visualizing Technology Supplying Basic Needs

Have students examine the pictures and read the captions. Then ask the following questions.

How does modern agriculture increase yields over traditional methods? *Modern agriculture uses large tractors instead of horses, large farms instead of small ones, chemical fertilizers instead of organic fertilizers, special pesticides, and specially engineered seed.*

How does the construction of roads affect the other technologies? *Roads allow for transportation of food, medicines, parts, tractors, and workers. Without roads, other technologies can be difficult to implement.*

Activity

Divide the classroom into several groups and ask them to do the following exercise. If you were in charge of bringing technology to a developing country and could only bring one technology a year, in what order would you bring the technologies? Why?

Post Reading

Science Journal Technological advances range from the invention of the ballpoint pen to the invention of the television. Ask students to think about the technological advancements they have seen in their lives. Have them respond to this prompt: How has technology changed your life?

Figure 7

Technology is used to help supply the basic requirements of people across the globe. Many of life's necessities that we take for granted in the United States are lacking or inadequate in other countries.

▲ **Water Treatment** Polluted water can cause diseases. Treating the water with chlorine kills germs.

◀ **Vaccines** Diseases like polio, measles, and tetanus kill hundreds of thousands of people a year. Vaccines cause the human body to make antibodies for a specific bacteria or virus. If this bacteria or virus enters the body, the antibodies destroy it.

▲ **Modern Agriculture** Farming with tractors on vast fields and using pesticides and specially engineered seed can increase the amount of food a country produces.

▲ **Power Plants** Electricity is necessary for many technologies. Electricity can be produced in many ways including burning coal, using moving water, absorbing the heat of solar rays, and using heat deep in the earth.

▲ **Transportation Systems** Technology allows countries to build roads, airports, and canals that let food, medicine, and information travel quickly to where it is needed.

Differentiated Instruction

Challenge Have students make a detailed list of the pros and cons of using technology to move from a developing country to a developed country. Pros include more food, longer life spans, new conveniences and job creation. Cons include

pollution, cultural disruption, ecological damage, forced relocation, and diseases of the wealthy like obesity and diabetes. Ask students to evaluate how the pros and cons would affect their decision to implement a technology.

Bioengineering and Food Can technology stop world hunger and starvation? Agricultural biotechnology can increase the yields of farm crops. It also can increase the nutritional value of the food produced. **Agricultural biotechnology** is a collection of scientific techniques, including genetic engineering, that are used to create, improve, or modify plants, animals, and microorganisms. For example, changing the DNA of a plant such as corn can improve its tolerance to drought. Other benefits could make it disease and insect resistant, or improve its nutritional value. The end result may be a higher crop yield and a product that provides more nutritional value per serving.

Genetically altering plant species is a highly controversial practice. Some people argue that the practice is too dangerous. They argue that humans should not alter species that occur naturally on Earth. Others argue that new species could harm natural ecosystems. New crops could pose human health risks such as food allergies or toxins.

A discussion also exists over whether more food really is needed to feed the world population. One argument is that enough food is produced, but it is not equally distributed throughout the world. As you can see, using technology to solve human problems is not always an easy task. Often there are many obstacles and issues involved.

Scienceonline

Topic: Biotech Foods

Visit fl.gpscience.com for Web links to information about agricultural biotechnology and biotech foods.

Activity Create a pamphlet explaining the risks and benefits of biotech foods.

3 Assess

DAILY INTERVENTION

Check for Understanding

Interpersonal Divide the class into small groups. Have each group compile and share a list of items or actions that are scientific achievements and a list of items or actions that are technological achievements.

Reteach

Technology Write examples of technology, such as radio or Internet, on the board. Ask students to identify the type of technology represented. **Radio is a human-made technology object. The Internet is an example of a technological system.**

section 1 review

Summary

Scientific Discovery

- The study of science leads to a better understanding of natural events that occur.

Scientific Insight

- Once there is an understanding of why a natural process occurs, people learn how to respond to the event and try to control the outcome.
- Scientific insight changes human behavior.

What is technology?

- Technology can be an object, a technique, a skill, or a system.
- The value of technological objects varies over time.

Global Technological Needs

- Technological needs vary around the world.

Self Check

1. **Describe** a situation in which scientific insight changed people's understanding, resulting in behavior change in response to a natural event or process.
2. **Classify** List the types of technology and give at least two examples of each type.
3. **Explain** why the types of technology valued varies from location to location.
4. **Think Critically** Cell phones are a technology that is popular throughout the world. Would this technology be of use in rural areas of the world? Explain your answer.

Applying Math

5. **Calculate** Approximately 38 million people are infected with HIV worldwide. Two-thirds of this group lives in sub-Saharan Africa. Calculate how many sub-Saharanans are affected.

Assessment

Content Divide the students into small groups. Have students debate whether or not agricultural biotechnology should be used for food crops. Half of each group should be assigned "for biotechnology development" and the other half should be "against biotechnology development." Allow each group some time to brainstorm their ideas before the debate begins. Use PASC, p.,169

section 1 review

1. Possible answer: Today people understand that microbes transmit illnesses and disease. People now take precautions against spreading microbes.
2. Possible answer: object, ball-point pen; method, building a house; knowledge, driving a car; system, airport
3. Locations around the world vary in the amount of technology and resources that are available to the public. For instance, many locations do not have electrical power in homes. Any electrical device would be useless in these locations and not valued.
4. It would be of value only in the large cities. In the rural areas, there is no electrical power and the people do not have the money to buy cell phones. There are few areas in which the phones would work because the entire country does not have cell phone coverage.
5. approximately 27 million

Forces that Shape Technology

Section Focus Transparencies also are available on the Interactive Chalkboard CD-ROM.

L2 ELL

Section Focus Transparency Three Mile Island Nuclear Generating Station Chapter 2

On March 28, 1979, a nuclear reactor near Harrisburg, Pennsylvania suffered a partial core meltdown. Unlike the meltdown at Chernobyl, no radioactive material was released into the atmosphere. However, it furthered a serious decline in the public popularity of nuclear power. By coincidence, the event occurred just days after the release of the movie *The China Syndrome* which portrayed a similar, yet fictional, incident.

1. What impact do you think the accident at Three Mile Island had on the development of nuclear power in the United States?
2. Can you think of any disadvantages of nuclear power?
3. What are the advantages of nuclear power?

L2

Reading Preview

Tie to Prior Knowledge

Ecosystems Remind students that an ecosystem consists of the living and nonliving parts of an environment that are interdependent. Altering an ecosystem affects the organisms, including humans, that depend on that physical environment for survival.

Word Map Have students make a concept map with the new vocabulary word *society* in the center. Have them connect three large ovals to the word. Ask students to write the definition in one oval. In another, have them create a sentence using the term. In the last oval, have students make a sketch of the word's meaning.

Reading Guide

What You'll Learn

- **Discuss** how funds for science research come from the federal government, private industries, and private foundations.
- **Explain** how consumers affect technological development.
- **Describe** the importance of responsible technological development.

Why It's Important

Society and economic forces influence which technologies will be developed and used.

Review Vocabulary

ecosystem: a complex community of organisms that function together in a particular environment

New Vocabulary

- society

Social Forces that Shape Technology

Science and society are closely connected. **Society** is a group of people that share similar values and beliefs. Discoveries in science and technology bring about changes in society. In turn, society affects how new technologies develop. The development of technology is affected by society and its changing values, politics, and economics.

In the past 100 years, attitudes in the United States have changed toward automobiles. Many people were able to own cars due to the changes in technology and manufacturing. As car ownership increased, so did fossil-fuel consumption. With rising gasoline prices, some consumers began buying more fuel-efficient cars. The automotive industry has researched and developed technologies that make cars more fuel-efficient. Today we have hybrid cars that use both gasoline and electricity.

Figure 8 Consumers often decide which technologies will be developed. If consumers do not purchase a product, additional money usually will not be spent on the production or improvement of the product.

Consumer Acceptance Purchasing technology is a direct way in which people support the development of technology, as shown in **Figure 8**. For example, if consumers continue to purchase fuel-efficient cars, additional money will be spent on improving the technology. If consumers fail to buy a product, companies usually will not spend additional money on that type of technology.

Reading and Writing Skills Activities, pp. 9–10

Personal Values People will support the development of technologies that agree with their personal values, directly and indirectly. For example, people vote for a congressional candidate based upon the candidate's views on various issues. This is an indirect way in which people's personal values influence how technology projects receive funding. People support the development of technology directly when they give their money to organizations committed to a specific project, such as cancer research.

✓ Reading Check *How do the personal values of consumers influence which technologies will be developed?*

Economic Forces that Shape Technology

Many factors influence how much money is spent on technology. Before funding is given for a project, several questions should be answered. What is the benefit for this product? What is the cost? Who will buy this product? All these questions should be answered before money is given for a project. Various methods exist to fund new and existing technology.

Federal Government One way in which funds are allocated for research and development of technology is through the federal government. Every year, Congress and the president place large amounts of money in the federal budget for scientific research and development. These funds are reserved for specific types of research, such as agriculture, defense, energy, and transportation. This money is given to companies and institutions in the form of contracts and grants to do specific types of research. Citizens can influence elected officials by telling them how they want the official to vote, as shown in **Figure 9**.

Private Foundations Some scientific research is funded using money from private foundations. A private foundation, which is an organization not associated with the government, is a group of people who work together for a common goal. Funds are raised for various types of disease research, such as breast cancer and muscular dystrophy. Money is raised by events such as races and telethons. Many private foundations focus on research for a specific cause.

Figure 9 Participating in the political process is one way in which people can influence which technologies are developed and which are not.

Explain *how voting for someone in the Congress influences which technologies will be developed.*

SECTION 2 Forces that Shape Technology 47

Mini LAB

Evaluating the Benefits and Consequences of Technology

Procedure

1. Choose a technology that you value and do not want to live without.
2. Make a two-column table. Label one column *Benefits* and the other column *Consequences*.
3. Provide at least three entries for each column.

Analysis

1. Do the benefits of the technology outweigh the consequences? Explain.
2. Infer who funded the development of your technology. Explain.
3. Infer how you may influence future funding on this type of technology.

2 Teach

✓ Reading Check

Answer People influence the development of technology indirectly when they vote for members of Congress. They influence technology directly by giving their money to various organizations.

Mini LAB

Purpose Students reflect on the benefits and consequences of a technology that they do not want to live without.

Materials Science Journal, pencil

Teaching Strategy

- Encourage students to think about the raw materials that are used to make the product.
- Encourage students to think about environmental consequences their technology may have.
- After all of the above are considered, the students should evaluate the benefits and consequences of their technology.

Analysis

1. Accept all reasonable responses.
2. Answers will vary.
3. In most cases, purchasing the item will impact the future funding of similar technologies.

Assessment

Oral Is it possible to improve the benefits and reduce the consequences for your chosen technology? **Answers will vary**

Caption Answer

Figure 9 Members of Congress are elected by the voters in their districts. These representatives vote on the federal budget which funds many types of technology. Voting is an indirect way that people affect which technologies will be developed.

Activity

Current Issues Have students research a technological issue that is part of an election debate. The issue can be part of a local, state, or federal election. Have students find arguments from both sides of the debate.

Teacher FYI

DDT The pesticide DDT was used to kill disease-carrying and crop-eating insects. DDT was successful in reducing the number of cases of yellow fever, typhus, malaria, and other diseases carried by insects in many parts of the world. DDT was banned or strictly regulated after it was discovered that it was adversely affecting animals, such as the bald eagle.

Environmental Protection Agency

The EPA does more than just protect the health of humans and the environment. The organization develops and enforces regulations. They offer financial assistance through grants to states, non-profit organizations, and educational institutions for environmental projects. The scientists who work for EPA perform environmental research.

Environmental Protection Agency

The purpose of the EPA is to protect human health and the environment. The EPA was established in 1970 by the White House and Congress. Cleaner air and water, along with cleaner land, were things that U.S. citizens have demanded. Prior to the establishment of the EPA, the government had no organized method to reduce pollutants. Research the water quality for your city or state.

Private Industries Research and development also is funded by private industries. Industries budget a portion of their profits for research and development. Investing in research and development often makes money for the company. Bringing new products to the marketplace is one way companies make profits.

Responsible Technology

Humans have the ability to invent tools and processes that can have an impact on other living things. Humans are part of many ecosystems on Earth. It is important that any technology that is used does not destroy the environment, as shown in **Figure 10**. It is important that both positive and negative consequences of a particular technology be considered.

Environmental Issues Sometimes the consequences of technology are known, but the benefits are perceived to outweigh the risks. One example of technology that has both positive and negative consequences is gasoline-powered cars. Gasoline-powered cars give the benefit of reliable transportation. The negative consequences are the environmental problems created by drilling for oil, air pollution, and disposal of unwanted cars. The disposal of used petroleum products, such as motor oil, also is a problem.

Sometimes the benefits of technology are known immediately, but the consequences are not known for a period of time. For example, at one time, the pesticide DDT was eagerly accepted by people. It killed insects that were damaging agricultural crops.

The fact that DDT was damaging the environment was not known immediately. When the damage was discovered, DDT was banned and other pesticides were developed. Consumers and voters have a responsibility to weigh the benefits and consequences of technology. They play a major role in determining which technologies are used and which are rejected.

Figure 10 In March 1989, approximately 42,000 kiloliters of oil were spilled in Prince William Sound, Alaska. Animals, such as ducks and birds, are affected by human-made environmental disasters.

Visual Learning

Figure 10 No one knows the exact number of wildlife harmed or killed by the oil spill. Oil can injure wildlife by coating the fur and feathers, causing them to ingest the oil while trying to clean themselves, or by making them incapable to protect themselves. Liquid dish detergent is used to clean the oil from the animals. Have students research to determine which wildlife has not yet recovered from the oil spill.

Differentiated Instruction

Learning Disabled Pair students with learning disabilities with other students that can assist them in finding the Ukraine on the globe or atlas.

The Chernobyl Accident Possibly the worst technological accident in modern times occurred on April 26, 1986, at the Chernobyl nuclear power plant in the Ukraine. Large areas of land were contaminated and more than 400,000 people had to be relocated. The city of Pripjat had to be abandoned, as shown in **Figure 11**. An accumulation of radioactive fallout in the upper layers of soil has destroyed important farmland. Groundwater and surface waters were contaminated. Some water wells had to be sealed. Structures had to be built to prevent rivers and streams in the area from contaminating additional rivers in the watershed, which led to the Black Sea.

The radiation also affected many animals and plants around Chernobyl. As the radiation diminished, plants and animals started to repopulate the area.

Why did the residents near the accident have to move?

Figure 11 This town once was home to about 45,000 residents. It is now abandoned because radioactive contamination has made it unsafe to live in.

Identify possible health effects that Ukrainians faced.

Applying Science

What impact does the accident at Chernobyl have on the future of nuclear power?

The nuclear accident at Chernobyl in 1986 demonstrates the far-reaching impact of a nuclear disaster. Not only were the residents and environment surrounding the facility influenced, but nuclear fallout was spread across most of the northern hemisphere. Parts of the USSR and Europe were seriously affected.

Identifying the Problem

Many countries, including the United States, use nuclear power as a source of electric power. Is it important for industrialized countries, such as the United States, that have vast resources and knowledge about nuclear power generation, to assist developing countries in their nuclear power generation programs?

Solving the Problem

1. What are the benefits and consequences of allowing developing countries that do not have the experience that developed countries have to develop nuclear power on their own?
2. What are the benefits and consequences of assisting developing countries?

Discussion

Responsibility How does the Chernobyl accident exemplify irresponsible technology? **Safeguards** were not in place to prevent the accident from occurring.

Applying Science

Answers

1. Possible answers: Benefits—Safe systems can be built based on proven technologies without the risk of a preventable nuclear disaster. Consequences—Developing countries may build an unsafe system because they do not have the knowledge or experience needed to build safe systems.
2. Benefits—Many countries benefit because a safe system is built and a tragedy similar to Chernobyl is averted. Consequences—Developing countries may use the technology to develop nuclear weapon systems.

Caption Answer

Figure 11 leukemia, thyroid cancer, cancer, genetic problems, radiation poisoning

Content Background

The radioactive elements that were released into the air were iodine-131, cesium-137, and strontium-90. Due to this release, much of the area will remain uninhabited for centuries. The land affected by the accident is approximately the size of Kentucky. The reactor, which caused the accident, is buried in a concrete tomb. It will remain radioactive for centuries.

Reading Strategy

Panel Discussion After students read the text titled Responsible Technology, form a panel of students to respond to the following prompt: Space exploration poses risks to society and to the astronaut. Are the benefits worth the risks? Have the class add to the discussion by asking questions to the panel.

Curriculum Connection

Geography Have students find the location of the Chernobyl nuclear power plant on a globe or in an atlas. **It is located in the country of Ukraine, which was once part of the Soviet Union.** Have students identify the countries surrounding the Ukraine.

Post Reading

Essay Have students consider technology issues they have read about that might be controversial. Ask them to write an essay in which they present their opinions regarding the issue. For instance, an essay topic might involve the engineering of disease-resistant wheat through crossbreeding.

3 Assess

DAILY INTERVENTION

Check for Understanding

Linguistic Write a paragraph explaining why morality and ethics are important in science.

P

Reteach

Responsible Technology Have students explain why humans must practice responsible technology. *Because humans can have an enormous impact on other living things through the use of technology.*

Assessment

Content Have students work in small groups to write a newspaper article about the nuclear disaster at Chernobyl. Use PASC, p. 141.

ScienceOnline

Topic: Morals and Ethics in Science

Visit fl.gpscience.com for Web links to information about morals and ethics in science.

Activity Choose a topic and write an essay describing the moral and ethical arguments surrounding the topic.

Moral and Ethical Issues When people need to distinguish between right and wrong, what is fair, and what is in the best interest of all people, moral and ethical issues are raised. Ethical issues in science pose questions and establish rules about how scientific hypotheses should be tested and how society should use scientific knowledge.

Ethics help scientists establish standards that they agree to follow when they collect, analyze, and report data. Scientists are expected to conduct investigations honestly and openly. Honesty is important because scientists share the results of their investigations with each other. As a result, one scientist's dishonesty can harm the investigations of many scientists.

Other ethical questions in science concern the use of animals and humans in scientific investigations. In the past, the inhumane treatment of humans and animals in experiments has led to public outcry. For example, human test subjects have been subjected to experiments against their will, or without informing them of risks associated with the research or the true nature of the experiments. Ethical questions about these practices helped to create laws and guidelines to prevent unethical treatment of both humans and animals in scientific research.

section 2 review

Summary

Social and Economic Forces that Shape Technology

- Societal and economic forces influence which technologies will be developed and used.
- The federal government, private foundations, and private industries fund research and development of technology.
- Consumers influence which technologies will be developed by their voting and buying habits.

Responsible Technology

- Humans must be responsible in their technological choices because the technology may have an enormous impact on other living things and the environment.
- The risks and benefits of technology must be considered before developing and using it.
- Consumers and scientists must consider moral and ethical issues when choosing which technologies should be developed.

Self Check

1. **Describe** how private citizens have a voice in which projects the federal government will fund.
2. **Explain** how you can influence whether or not funding will be spent on developing certain technology.
3. **Describe** a situation in which technology had unexpected consequences.
4. **Think Critically** Many products carry a message on their label that no animals or humans were used in the testing of the product. Is this good or bad for the consumer? Explain your answer.

Applying Math

5. **Use Percentages** In 2001, approximately \$41 million was spent by the Department of Defense for Research, Development, Test, and Evaluation. If the total amount of money spent by the department was over \$305 million, what percent of the defense budget does this represent?

section 2 review

1. Private citizens have an indirect voice because they elect the people that make the decisions.
2. You can influence funding by voting and by contributing money to private foundations that are involved in developing the technology.
3. Possible answer: Gasoline-powered cars created smog and air-pollution problems.
4. This can be good and bad. It is good because humans and animals were not harmed in the testing. It is bad because the product may not have

been fully tested before it was sold to the consumer.

5. 13 percent

MA.A.1.4.4

Who contributes CO₂?

Many scientists believe that Earth's surface temperature is rising because of increasing levels of heat-trapping carbon dioxide, CO₂, in Earth's atmosphere. The combustion of fossil-fuels contributes CO₂ to Earth's atmosphere. Significant amounts of CO₂ are produced by cement production and gas flaring.

Real-World Problem

Which countries produce the most carbon dioxide from the combustion of fossil fuels?

Goals

- **Compare and contrast** the total carbon dioxide emissions from selected countries.
- **Calculate** the average annual per capita amount of carbon dioxide for each country.
- **Form a hypothesis** that explains the amount of carbon dioxide produced by each country.

Materials

Science Journal
pen or pencil

Procedure

1. Copy and complete the data table in your Science Journal by calculating the amount of carbon dioxide produced per person for each country.
2. **Formulate** a hypothesis that explains the amount of carbon dioxide produced by the inhabitants of the countries listed in the table. For each country, consider the following factors: size; population density;

Countries CO₂ Emissions

Country	CO ₂ Emissions (millions of tons of carbon)	Total Population (millions of persons)	CO ₂ Produced (tons/person)
United States	1,446.8	263.8	5.48
China	918.0	1,210.0	0.76
Russian Federation	431.1	149.9	2.88
Japan	318.7	125.5	2.54
India	272.2	936.5	0.29
Canada	111.7	28.4	3.93
France	98.8	58.1	1.70

transportation requirements; heating and cooling requirements; development and industry; means of generating electricity.

Conclude and Apply

1. **Graph** the data of carbon dioxide produced per person using a bar graph.
2. **Think Critically** Why might more developed, industrial countries have more carbon dioxide produced per person?
3. **Evaluate** Did the results obtained from your calculations support your hypothesis?

Communicating Your Data

Compare your bar graphs with those of other students. Discuss any differences, particularly if some students used computer graphing programs to prepare their graphs.

LAB 51

Assessment

Oral Have students formulate and present ideas regarding ways that countries and individuals can reduce their carbon dioxide emissions and, thereby, do their part to combat global warming.

Communicating Your Data

Have students prepare their bar graphs using computer graphing programs. Emphasize that data and results should be presented clearly and concisely for others to follow and understand.

Real-World Problem

Purpose Students compare total and per capita carbon dioxide emissions of selected countries, evaluate their results, and graph their data.

Process Skills analyze results, communicate, compare and contrast, evaluate, form hypotheses, interpret data, make and use graphs, think critically, calculate

Time Required 45 minutes

Procedure

Teaching Strategies

- Suggest that students work in pairs or groups to make and check their calculations and discuss the comparative amount of CO₂ produced for various countries.
- Have students work individually to prepare their graphs and write answers to questions.

Conclude and Apply

1. See student page for the amount of carbon dioxide produced per person. Check students' work for the bar graph.
2. Answers will vary. In general, more developed and industrialized countries tend to have higher CO₂ emissions. Persons living in these countries drive more automobiles and use more power-consuming conveniences and devices.
3. Answers will vary.

Challenger Space Shuttle

Chapter 2

On Jan. 28, 1986, the space shuttle Challenger exploded with seven crew members aboard. The explosion on the \$1.2 billion shuttle came at one minute, 15 seconds after launch when the shuttle was about 11 miles high and nine miles down range from the Kennedy Space Center. It was the 25th shuttle flight and tenth for Challenger. The disaster was the worst for NASA since the first Apollo moon capsule burned on its launch pad Jan. 27, 1967, killing three astronauts.

1. On February 1, 2003 NASA lost another space shuttle, the Columbia. What, if anything, could have prevented this disaster after what was learned about Challenger?

2. What are the differences in the design of the Challenger and the design of a commercial jumbo jet? Why are the designs different?

Developing Technology

Reading Guide

What You'll Learn

- **Discuss** how the roles of a scientist and an engineer differ.
- **Explain** how technological problems often create a demand for new scientific knowledge.
- **Describe** the general process used to find technical solutions to problems or human needs.

Why It's Important

Understanding how technology is developed can help you make better decisions as a consumer.

Review Vocabulary

system: a group of devices that work together to perform a specific function

New Vocabulary

- engineer
- constraints
- computer simulation
- prototype
- pilot plant
- control system

Scientists and Engineers

How do a scientist and an engineer differ? This may seem to be a very odd question, but it is important to learn the roles of these two types of professionals. Recall that a scientist is someone who has knowledge about science. He or she works to learn more information about science. Scientists may not know how or if the results of their work will be used, but they pursue knowledge for the sake of learning new things.

Scientists have knowledge of scientific principles. Most scientists have some knowledge of basic chemistry, physics, and biology. Many scientists specialize in one area of science. For example, a scientist may have a chemistry background but specialize in Earth science. This scientist will study the chemical and physical changes that occur on Earth. An Earth scientist

may specialize even further and study topics such as glaciers, earthquakes, or volcanoes.

Scientists often work in research laboratories doing research. In addition, scientists also work in the field, as shown in **Figure 12**. An Earth scientist is an example of a scientist that would conduct investigations and research in the field, as well as in the laboratory.

Figure 12 This meteorologist is collecting data on an approaching tornado. This information can be used in the study of tornadoes and how to protect people and property from damage.

✓ Reading Check What is a scientist?

Reading Preview

Tie to Prior Knowledge

Scientific Methods Tell students that finding a solution to a technological problem is much like using the scientific method in research. Both processes are very methodical and deliberate.

Word Associations Have students write a new vocabulary word in the center of a sheet of paper. They should draw four lines emanating from the central term. Each line will extend to words associated with the vocabulary term. For example, *engineer* might be associated with "problem solver" or "analytical."

Answer A scientist is someone who has knowledge of science and works to learn more information about science.

Discussion

Demand for New Technology What is another example of where technology created a demand for new technology? **Possible answer:** The invention of the airplane has created a continuous demand for new technology. How has the demand for technology led to advances in science? **Possible answer:** The advances made in air travel made it possible to go to space. Many advances in space science have been made because of our ability to do space travel.

Caption Answer

Figure 13 Possible answers: automatic transmission, catalytic converter to control emissions, power doors and locks

✓ Reading Check

Answer Scientists study science to find new information and engineers use science to solve human needs or mass produce products.

Teacher FYI

Marketing A driving force in the development of technology is whether or not the product or technology will sell. Marketing considerations often override other issues in the development of technology.

Figure 13 New technology often creates a demand for even more technology. Many technological advances have been made in the automobile since 1950.

Identify at least three different technological advances that have been made in the automobile since 1950.

Engineers A researcher who is responsible for bringing technology to the consumer is called an **engineer**. Using scientific information or an idea, an engineer creates a way to solve a problem or to produce a product. For example, decreasing petroleum deposits and high prices for gasoline have created a demand for cars that get better gas mileage. Engineers are working to improve an engine called a hybrid. The hybrid engine operates on electricity and gasoline or diesel to power the car. Fuel efficiency increases by combining the two power sources. Cars currently are available using this technology. As this example demonstrates, consumers want cars with better gas mileage. Engineers worked to create technology that would satisfy this consumer demand.

Technological problems often create a demand for new scientific knowledge. Time and money are devoted to finding new scientific information, which makes it possible for scientists to extend their research in a way that advances science. Many unexpected discoveries happened when scientists were looking for a technical solution. In addition, new technology often creates a need for even more technology, as shown in **Figure 13**.

Engineers not only design automobiles, they work in many areas of science. There are aeronautical, aerospace, biomedical, chemical, computer, electrical, mechanical, and many other types of engineers. At some point of the manufacturing process, engineers are involved in the development of the products you use every day.

✓ Reading Check How do scientists and engineers differ?

Differentiated Instruction

Learning Disabled The vocabulary in this section is complex. Have students create an illustrated glossary of the terms. Students can write the word and definition on an index card. Students should draw an illustration or glue a photo on the card that illustrates the meaning of the word.

Fun Fact

One of the first scientific societies formed in Italy in 1603. The purpose of the *Accademia del Cimento* was to exchange scientific information.

Young Owl Gets Help Research on animals is beneficial in several ways. Zoo and domestic animals can be treated with new technologies when the need arises. Species of animals that are near extinction can be saved and can produce offspring.

Inquiry Lab

Finding Solutions

Purpose to model the process for finding a solution

Possible Materials poster board, newspaper ads

Estimated Time 1 week

Teaching Strategies

Students have a budget of \$500.00 to design the perfect bedroom for a friend. They are to propose solutions, identify constraints, comply with all rules set by the friend and the friend's parents, and create a scale drawing to make sure that everything fits in the room. Encourage students to cut pictures out of the newspaper showing prices for items they want to purchase.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Caption Answer

Figure 14 scientific method

Reading Check

Answer to find a possible solution

Young Owl Gets Help Technology can be used in unusual ways. A young, great-horned owl was observed sitting on a fence for several days without moving. It seems the owl could not see and could not search for food. Veterinarians removed the owl's cataracts and fitted the owl with new artificial lenses. The owl recovered and was returned to the wild. Research other medical procedures that can be used to help animals.

Finding Solutions

Scientists and engineers work together to find technological solutions, as shown in **Figure 14**. They often use a system much like the scientific method. The general process is outlined in this section. However, there are many variations to this procedure, just as there are many kinds of technical problems.

Identifying the Problem The first step in finding a technical solution is to define clearly the problem that you are trying to solve. The problem must have a narrow enough focus so that a solution is possible. For example, it would not be helpful to define the problem as, "Create and build a new vehicle." This definition of the problem is too broad. What type of vehicle is needed? Should the vehicle be designed to carry passengers or heavy loads or both? What type of fuel should the new vehicle use? What types of materials should be used to construct the vehicle? Is there a market for the vehicle once it is built? All of these questions and many more should be answered in the definition of the problem. A better statement of the problem may be, "Build a new passenger vehicle from readily available materials that has an improved gas mileage of at least 20 percent over current, similar-size models and is competitively priced."

Proposing Solutions Once the problem is clearly defined, the search for the solution can begin. This is not always an easy process. There are many factors to consider when searching for the best solution to a problem. The best solution must be found while working with many limitations.

Reading Check Why is it important to have a clearly defined problem?

Figure 14 Scientists and engineers work together to solve technical problems.

Identify the type of system scientists and engineers use to find technological solutions.

LAB DEMONSTRATION

Purpose to test the strength of two types of thread.

Materials spool of cotton thread; spool of nylon thread; ring stand; ring; assorted small weights.

Procedure Attach the ring to the top of the ring stand. Tie the cotton thread to the

ring stand. Cut the thread so that it will not touch the table after the weights are attached. Measure the length of the string. Attach weights to the string until the string breaks. Record the total amount of weight attached. Repeat the procedure with the same length of nylon string.

Expected Outcome The nylon thread supports more weight.

Assessment

Which thread would provide the strongest seam? **nylon.**

Constraints Design restrictions for products from outside factors are known as **constraints**. Examples of constraints are cost, environmental impact, and available materials. Constraints also include limited time to complete the task, limited funding, and design changes that must be made to satisfy laws and regulations. In addition, working with too little information or technical data can be constraints. Some designs may be perfect solutions but they cannot be built. Some materials may not be available or do not exist. Money may not be available. The solution to the problem may be a compromise because of many design constraints.

Figure 15 This is a computer simulation of an aircraft in a wind tunnel. The lines and colors surrounding the aircraft show airflow and turbulence. Scientists who use computer simulation can work to improve the aircraft design.

List other ways that a computer simulation can be used.

Performance Testing Once design ideas are accepted, drawings or models usually are constructed. These are carefully evaluated to identify possible design flaws. It is important to find design flaws as early in the process as possible. The later a design flaw is found in the process, the more expensive it is to correct.

After the drawing or model has been thoroughly evaluated, the design must be tested to make sure everything operates as planned. Many ways exist to performance test a design. The type of performance test used depends upon the design. For example, a chemical process may be tested initially by using a computer simulation. A **computer simulation** uses a computer to imitate the process to collect data or to test a process or procedure. Computer software is designed to mimic the processes in the design, as shown in **Figure 15**.

Complying with Laws and Regulations Local communities, states, and the federal government have laws and regulations regarding manufacturing processes, products, or buildings. These regulations often cover topics such as worker safety, environmental protection, product transportation, and how pleasing the manufacturing facility looks in the community. Products also must meet ethical or moral standards in their production, testing, and use. All of these factors must be considered when designing technology.

Set a Purpose Have students scan the following sections: Identifying the Problem, Proposing Solutions, and Constraints. Remind them to pay attention to headings, bold print, and figures. Have them set the purpose by writing down what they expect to learn from each section. As they read, have each student note if his or her purpose has been met.

Activity

Product Features and Solutions

Show the students a laptop computer bag. Allow students to examine the bag closely. Have students make a list of features that the bag must have to protect the laptop computer. Then, have students make a list of features the bag has that are added for convenience such as pen holders, straps, etc.

Quick Demo

The Best Protection

Materials polyester batting (used in quilting), sheet of firm foam (used in upholstery)

Estimated Time 10 minutes

Procedure Engineers must select the best materials for a product. Allow students to examine both materials. Ask students which would be the best material to place in a laptop computer bag to protect the computer. Place both samples on a desk or table. Place a laptop computer or a heavy textbook to simulate a computer on each material. Which material is depressed less? **the foam** Which material would provide more protection for the computer? **the foam** **Why?** **The foam will absorb more force which will protect the computer.**

Caption Answer

Figure 15 testing cars, wind speed test on airplanes, designing a house, designing clothes

Visual Learning

Figure 15 Computer simulation or modeling started with the Manhattan Project. Scientists used the computer to simulate the process of nuclear detonation. Today, researchers use computer modeling to study all areas of natural science and social science.

Science Journal

Local Laws Have students attend a local planning and zoning meeting. Have students write in their journals the different laws that citizens and companies are required to follow when building or remodeling a structure.

Make a Model

Bridges Have students make a model of a bridge using toothpicks and glue. Students' bridges should span a distance of 30 cm. Have students design a way to performance test the bridges to see which bridge will support the most weight.

Use Science Words

Word Origin The prefix *proto* means "first in time". Have students write entries in their Science Journals explaining how the meaning of the word prototype is derived from the mean of its prefix and root word.

Use an Analogy

Control Systems Tell students that control systems are similar to traffic lights and stop signs on streets. Both are designed to control the flow of objects and processes.

Flight-Test Engineer A flight test engineer must have an engineering degree from a college or university. Additional training in flight testing usually is required before an engineer begins to work as a flight test engineer.

Caption Answer

Figure 16 A prototype allows engineers and scientists to thoroughly performance test a design before it goes into production.

Post Reading

Cooperative Projects Have groups of three to four students choose a profession in the field of science or engineering. Students might choose, for example, a civil engineer. Have them develop a presentation that discusses both the challenges and rewards of the profession.

Figure 16 This robot, which is 39 cm tall, can be controlled by a cellular phone or by voice commands. The robot can be used in schools to teach about engineering and computer programming.

Explain why it is important to make a prototype of a new product.

Prototypes and Pilot Plants Constructing a prototype or manufacturing in a pilot plant are methods of performance testing. A **prototype** is a full-scale model that is used to test a new product such as a new car design or a new airplane product. A prototype, as shown in **Figure 16**, is the first full-scale product that is built. A **pilot plant** is a smaller version of the real production equipment that closely models actual manufacturing conditions. A pilot plant would be used to test a new manufacturing process, such as a production line to produce a new medicine.

Limiting System Failure Performance testing is one way to limit system failures. A system is a group of devices that work together to perform a specific function. Other ways to limit system failures are to put redundant systems within a design. A redundant system performs the same function within a design. These systems are used for important processes that would force the entire system to shut down if there is a failure. When redundancy is built into the design, if one part fails the other system will take over, keeping the entire system from failing.

Control systems, such as a fail safe system, also are incorporated into designs to keep the system from failing. A **control system** is a device or collection of devices that monitors a system. This device makes corrections to keep the system operating at preset conditions. A simple control system is the thermostat on an air conditioner or heater. An air conditioner thermostat turns the unit on when the air temperature rises to a preset high temperature. When the air temperature drops to the preset low temperature, the unit is turned off. Control systems can be simple, like a thermostat, or very complicated, like an elaborate computer system that controls heating and cooling. The purpose of control systems is to keep the system operating at desired conditions.

Flight-Test Engineer

One of the crew members responsible for flight-testing an airplane or helicopter prototype is a flight-test engineer. The flight-test engineer is responsible for planning the test, acquiring the test equipment, writing the test plan, conducting the test, and then writing the test report. Research the educational requirements of a flight-test engineer.

Active Reading

ReQuest To improve listening skills, have students listen carefully as you read the discussion about limiting system failure in this section. After the reading, have students construct questions to be discussed in class. You can have students reread the section and participate in the questioning with other students.

Differentiated Instruction

Challenge Have students research the process that is required to get a patent on a new invention. Have students prepare an informative visual aid that can be presented to the class that explains the process. **SP**

Intellectual Property Once a new product is introduced, it is important that a company protects its investment. Research and development of a new product is costly. Often, it takes years to bring a new product to the consumer. Companies protect their rights to sell their new product or process by applying for a patent. A patent is a legal document granted by the government giving an inventor the exclusive right to make, use, and sell an invention for a specific number of years. In the United States, a new patent lasts for 20 years. A patent allows a company to get the money back that they have spent on creating the new product or process.

A patent is one example of intellectual property. Intellectual property is any type of creative work that has financial value and is protected by law. Patent laws protect technological inventions. Copyright laws protect literary and artistic works such as music, plays, poetry, and novels. The compact discs shown in **Figure 17** are examples of copyrighted products. Trademark laws protect words or symbols that identify brands, goods, or services in the marketplace.

Reading Check What are three types of intellectual property, and can you give an example of each type?

Figure 17 Music compact discs are copyrighted. Copyright protection lasts for the author's life plus an additional seventy years after the author's death.

Reading Check

Answer patents—the chemical process to make a new medicine such as a high blood pressure medication; copyright—this text-book; trademark—the Nike swoosh

3 Assess

DAILY INTERVENTION

Check for Understanding

Interpersonal Divide students into small groups. Have students create a flow chart that describes the process for developing technology. *Check students' charts.*

Reteach

Scientists and Engineers Have students write a description of the work of a scientist and the work of an engineer on two pieces of paper. Have students exchange papers with a neighbor. See if the neighbor can identify which description is that of an engineer and which is that of a scientist.

Assessment

Oral Why is it important for a design to be performance tested? to find design flaws and to make sure the design works as intended

section 3 review

Summary

Scientists and Engineers

- Scientists seek new scientific knowledge, but they may not have a plan to use that knowledge.
- Engineers use science to find solutions to problems or human needs.
- Technical problems often create a demand for new scientific knowledge.

Finding Solutions

- Scientists and engineers often work together to solve technical problems.
- Performance testing often is conducted using models and computer simulations to reduce the chance of system failure.
- Intellectual property such as technology, music, and symbols that identify products is protected by law.
- Companies protect their investment in technology with a patent.

Self Check

- Compare and contrast** the roles of scientists and engineers.
- Describe** a specific situation in which new technology created a demand for even more technology.
- Describe** Briefly describe the general process that is used to find technological solutions.
- Think Critically** Some foreign countries do not have intellectual property laws. It is common for people in these countries to illegally manufacture goods that are protected in the United States and sell them to consumers. Explain how this financially harms companies in the United States as well as the consumer.

Applying Math

- Use Percentages** The U.S. Customs and Border Protection made 6,500 seizures of merchandise in violation of intellectual property rights in the year 2003. This was an increase of about 700 seizures over the previous year. What was the percentage increase in the number of seizures from 2002 to 2003?

section 3 review

- Both scientists and engineers use scientific knowledge in their work. Scientists usually work to discover new scientific information. Engineers usually use science to solve human problems or needs.
- The introduction of the automobile has created a continuous demand for new technology.
- Scientists and engineers identify the problem, find the best solution, performance test the solution, test a prototype or create a pilot plant, and produce the item.
- It harms the companies because they do not get the profits from the product. It harms the consumer because the quality of the product is usually inferior in counterfeit products.
- 12 percent

Real-World Problem

Purpose Students will design and make a model of a package that can be safely shipped to a consumer.

Process Skills observe, use numbers, communicate, infer, formulate models, recognize cause and effect, make and use a table, communicate

Time Required one class period

Materials Encourage each student to bring a large package of snacks to share. This will give students an assortment of items to choose from. Students should provide the cost of the items they bring, so that a cost analysis of the gift packages can be calculated.

Safety Precautions Remind students not to eat in the lab and not to eat the lab materials.

Make a Model

Possible Procedures Set the possible materials on a table for students to get their own supplies. You may want to have pictures of gift packages from catalogs that are currently sold on display. This may give the students inspiration and ideas.

Goal

- **Model** packaging and shipping a product for consumer interest.
- **Calculate** the cost to produce a consumer product.
- **Test** your packaging design to see if it keeps the snacks from being damaged.

Possible Materials

shoe box
assorted snack foods
packing peanuts
shredded newspaper
packing tape
wrapping paper
markers

Safety Precautions

Care Package

Real-World Problem

Suppose you are a young businessperson with a new idea for a product. You are going to create a care package for students to use during exams week. You must select the items for your care package, pack the items for display and shipping, and calculate the cost of the care package. How can you package foods to survive the hazards of shipping and keep your costs to a minimum?

Make a Model

1. **Choose** the snack items that you would like to include in your care package.
2. **Plan** how you are going to pack your items so that they are nicely displayed and safe for shipping.
3. **Plan** the design of your decorative wrapper and labels. Remember to make the wrapper attractive so that customers will want to purchase your product.
4. **Design** a data table in your Science Journal to keep track of all your costs to make the care package.
5. **Evaluate** your design plan. Determine if there are ways to cut costs to increase your profit.
6. Make sure your teacher approves your plan before you start.

58

Sample Data Table:

Food Item	Unit Cost	# of Items	Total Cost
Candy bar	\$0.89	2	\$1.78
Potato chips	\$1.39	1	\$1.39
Cookies	\$0.75	2	\$1.50

Using Scientific Methods

Test Your Model

1. Assemble the items that you need to carry out your plan.
2. Pack the materials according to your plan. Do not put on the decorative wrapper until after you have tested your package.
3. After you have carefully packed your box, test to make sure that everything is secure. Drop the box from the height of your lab table five times.
4. Unwrap your box to see if anything is damaged. If the contents are broken, determine changes that can be made to improve your design.
5. If needed, retest your new design. After the drop tests are successful, apply your wrapper and labels.

Analyze Your Data

1. **Calculate** the cost of your package.
2. **Determine** the constraints of your design.

Conclude and Apply

1. **Explain** how you can improve your design. Consider cost, contents of package, and packaging.
2. **Determine** under what conditions the contents of your package may be damaged. For example, if your package contains chocolate, the package cannot be shipped during hot summer months. What changes can you make to your design to remove the shipping constraints?
3. **Infer** what would happen to the contents of your package if the package were dropped from heights taller than your lab table.

Communicating Your Data

Present your design to your classmates. Compare your design to those of your classmates. Look for ways that you could improve your design.

LAB 59

Teaching Strategies

- Encourage students to be creative in their designs.
- This lab provides an opportunity for students that are gifted in art and design to be leaders in a science activity.

Test Your Model

Expected Outcome Students will build a model of a gift box that can be safely shipped through the mail without damaging the contents of the box.

Analyze Your Data

1. The cost of the gift boxes will vary.
2. Constraints will vary. Students should look at the shelf life of their products, risks from temperature extremes, and damage to fruits in transit, if fruits are included in the packages.

Conclude and Apply

1. Ask students to record the answers to this section and discuss them in small groups.
2. Ask students to record the answers to this section and discuss them in small groups.
3. Ask students to record the answers to this section and discuss them in small groups.

Assessment

Content Have students work in small groups to make advertising flyers for their gift packages. Use PASC, p. 129.

Communicating Your Data

Students should be able to get ideas from other students on how to improve their designs. The changes may be cosmetic or functional.

Content Background

Teflon® is just one of many polymers. The first polymer was a natural one—the sap from the rubber tree. It has been used by South American Indians for hundreds of years. In 1839, Charles Goodyear discovered how to vulcanize rubber by heating it with sulfur. The result was a much stronger and more durable substance. The first plastic polymer was synthesized in 1907. Since then, the uses and kinds of polymers have greatly increased. Nylon, polystyrene (used in disposable coffee cups), polyester, epoxies and glues, polyvinyl chloride (PVC) pipe, and silicone are just a few examples.

Activity

Slippery Experiment Give groups of students a length of Teflon® tape and an assortment of other tapes and glues. Apply the tapes and glues to the Teflon® tape. Will anything stick to it?

WARNING: Be careful when using super glue. If students get superglue on their hands, fingernail polish remover will remove the glue.

Analyze the Event

Discuss with the class how some accidents are good (like the discovery of Teflon®) and how some are bad (like discovering that CFCs are harmful to the ozone layer). Ask how polymers can have so many different applications. Polymers can be used for many applications because their physical and chemical properties can be modified. **Polymers are composed of long chains of monomers. If the composition or arrangement of monomers is changed, the properties of the polymer will change.**

A Slippery Situation

Oddly enough, one of the slipperiest substances, Teflon®, was discovered by accident. Teflon was discovered in 1938 by Roy Plunkett, a research scientist. He was trying to improve the chemicals that refrigerators use to stay cool. He experimented with dozens of chemicals. One day, he noticed a gas cylinder that wouldn't operate. When he took the cylinder apart, he found that a white, slippery powder had clogged it.

Instead of being frustrated by a glitch in his experiment, Plunkett took the time to test this strange substance. What he found was amazing. This substance turned out to be extremely resistant to heat and highly inert. A substance that is inert will not react

with other substances.

Why is Teflon resistant to heat and corrosion? Because it is a polymer.

Polymers are compounds with long strings of a repeating unit, like a chain. This makes them very strong. This is why Teflon can withstand high temperatures and corrosion. Plastics are another example of a very strong polymer.

At first, scientists were skeptical about any practical uses for Teflon because it was so difficult to manufacture and therefore, very expensive. However, that changed when the Manhattan Project (the group of scientists who developed the atomic bomb) needed a substance that was heat resistant and chemically inert. This was the perfect job for Teflon. Since then, Teflon has found its way into many items, including the space shuttle, surgical implants, stain guards, and, of course, easy-to-clean pots and pans.

Look With a partner, walk around the room and make a list of objects that are made from polymers. The length of the list will surprise you. Your teacher can help you find many polymers.

Look Polymers are everywhere and include all plastics, glues, and rubbers, as well as PVC pipes used in plumbing, polystyrene cups, stainguard on fabrics and carpets, and polyester and rayon fabrics.

Resources for Teachers and Students

Reviewing Main Ideas

Section 1 Science and Technology

1. The study of science leads to a better understanding of the world around you.
2. Scientists bring information and insight to the public's attention and provide an understanding of why an event occurs. The knowledge that microbes cause illness and diseases changed people's behavior. Today we take precautions to prevent the spread of microbes by washing our hands often and covering our mouth when we cough.
3. Once people understand why an event or natural process occurs, they can respond and try to control the outcome.
4. Technology can be an object, a method or technique for making an object or tool, the knowledge or skill needed to operate a human-made object, or a system of people or objects that perform a task.
5. The value of technology varies over time and from location to location. This electric guitar may be valued by some in industrialized nations, but people in developing countries do not have electricity in their homes. This technology would be useless to them.

Section 2 Forces that Shape Technology

1. Funding for scientific research and technology comes from the federal government, private industries, and private foundations.
2. Consumers affect which technologies will be developed by their voting and buying habits.
3. Humans can have an enormous impact on other living things and must practice responsible technology.
4. The consequences of technology may be known immediately, but sometimes they are not known for a period of time.
5. Moral and ethical issues should be considered when doing scientific research or developing technology.

Section 3 Developing Technology

1. Scientists and engineers have different roles in developing technology.
2. Technological problems often create a demand for new scientific knowledge.
3. Scientists and engineers use a methodical process to develop technology. Performance testing is an important part of this process that reduces or prevents product failure.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review science, technology, and society.

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment

Assessment Transparency Science, Technology, and Society Chapter 2

Directions: Carefully review the graphs and answer the following questions.

DEMOCRATIC REPUBLIC OF THE CONGO	UNITED STATES	GERMANY
Age	Age	Age
Male	Male	Male
Female	Female	Female
0-14	0-14	0-14
15-64	15-64	15-64
65+	65+	65+

1. What percent of the population of the United States is female and is between the ages of 25 to 29?
 - A. 2.7 percent
 - B. 15 percent
 - C. 20.2 percent
 - D. 45 percent
2. Which country has the greatest proportion of individuals older than 60?
 - F. United States
 - G. Germany
 - H. United States and Germany
 - J. Democratic Republic of the Congo
3. Which country is likely to be spending the largest proportion of its total income on retirement benefits to its citizens?
 - A. Democratic Republic of the Congo
 - B. United States
 - C. Germany
 - D. Democratic Republic of the Congo and Germany

FOLDABLES Have students use their Foldables to review the main ideas in the chapter. Explain the difference between science and technology.

Using Vocabulary

1. engineer
2. computer simulation
3. society
4. constraints
5. prototype
6. pilot plant
7. control system

Checking Concepts

- | | |
|-------|-------|
| 8. B | 13. B |
| 9. C | 14. A |
| 10. A | 15. A |
| 11. B | 16. C |
| 12. D | |

Interpreting Graphics

17. See student page.
18. Science—finding the composition of Saturn's rings and finding the human genes that cause a birth defect; Technology—developing the vehicle that can fly to Saturn and producing a medicine that can cure a disease.

Thinking Critically

19. The protective clothing seems ridiculous to us because we know the cause of the disease today. The people of that time did not know the cause and were willing to accept an explanation that seemed reasonable to them.
20. Possible answer: Scientific knowledge explained how the temperature of the ocean affects the development of hurricanes.
21. Possible answers: object—calculator; method or technique—using a calculator to solve a math problem; knowledge or skill—the knowledge of how to use the calculator; system—NASA control center during a space mission

Using Vocabulary

- | | |
|----------------------------------|----------------------|
| agricultural biotechnology p. 45 | control system p. 56 |
| computer simulation p. 55 | engineer p. 53 |
| constraints p. 55 | pilot plant p. 56 |
| | prototype p. 56 |
| | society p. 46 |

Answer each question using the correct vocabulary word(s).

1. Which professional in science devises a way to use scientific knowledge to solve a problem or mass-produce a product?
2. What is performance-testing using a computer to imitate the process called?
3. What is the name of a group of people that share similar values and beliefs?
4. What is the term for design limitations put on the design by outside factors?
5. What is the full-scale model that is used to performance-test a new car design called?
6. What is the name of a scaled-down version of real production equipment that closely models actual manufacturing conditions?
7. What is a device that monitors a system to keep it operating at preset conditions called?

Checking Concepts

Choose the word or phrase that best answers the question.

8. Which represents technology?

A) canary	C) eating an apple
B) digital camera	D) native grass
9. Which technological object would be most valued in a developing country?

A) compact discs
B) electric can opener
C) portable water purifier
D) video recorder

10. What is a collection of scientific techniques that are used to create, improve, or modify plants, animals, and microorganisms?

A) agricultural biotechnology
B) agricultural cloning
C) agricultural prototype
D) agricultural simulation
11. Which is NOT normally a source of funding for technology?

A) federal government
B) local government
C) private foundation
D) private industry
12. Which is NOT considered part of moral and ethical considerations?

A) doing what is cost effective
B) doing what is fair
C) doing what is honest
D) doing what is right
13. What is the term for limitations put on the design of a product from outside factors?

A) conflicts	C) parameters
B) constraints	D) specifications
14. A thermostat on an air conditioner is an example of which of the following?

A) control system
B) environmental system
C) monitoring system
D) on/off system
15. What are patents legal protection for?

A) new medicine
B) new novels
C) new product symbol
D) new songs
16. Which does NOT represent technology?

A) calculator
B) computer program
C) granite rock
D) compact discs

Use the ExamView® Pro Test Bank CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

Interpreting Graphics

17. Copy and complete the following concept map on technology.

18. Make a table classifying each of the following actions as science or technology: finding the composition of Saturn's rings, developing the vehicle that can travel to Saturn, finding the human genes that cause a birth defect, and producing a medicine that can cure a disease.

Thinking Critically

19. **Draw Conclusions** Explain why technology of the past, such as the protective clothing shown in Figure 1, seems ridiculous to us today even though the people of the time accepted the technology as reasonable.
20. **Describe** one way in which scientific knowledge has changed people's understanding of a natural process or event.
21. **Describe** each type of technology and give a new example of each type.
22. **Explain** why the aircraft radar used by air-traffic controllers represents all types of technology.

23. **Explain** why the value of technology may differ for people living in different parts of the world.
24. **List** three technological items that you value that would not be important in a developing country such as Kenya.
25. **Describe** how technology can be used to supply basic human needs for survival to those who are in need.
26. **Explain** why ethics are important to scientists.
27. **Explain** how citizens of a local community can influence the development of new technology.
28. **Explain** During the mid 1970s, gasoline was in short supply. The price for gasoline increased. Automobile manufacturers produced smaller, fuel-efficient cars. The crisis soon was over and the smaller cars did not sell well. Explain how consumers' actions determined where the manufacturers spent their research funds.
29. **Explain** What type of intellectual property is protected by copyright? How does a copyright differ from a patent?

Applying Math

30. **Calculate** A hybrid car gets 20 km/L in city driving. The same model that is gasoline-powered gets 14 km/L in city driving. If gasoline costs \$0.53 per liter, how much money would be saved per year if you drove 19,000 km of city driving?
31. **Calculate** How many liters of gasoline would be saved using the hybrid car instead of the gasoline-powered car?

22. The radar is an object. Radar is a new technique used to monitor vehicles. The air traffic control system is a collection of objects and people that make air travel safe.
23. People in different parts of the world have different needs and have different resources available to them.
24. Possible answers: television, cell phone, and telephone
25. Possible answer: Medicines can be distributed to those in need to cure diseases and illnesses.
26. Some countries do not allow genetically-altered foods into their countries. They fear the consequences of genetically-altered foods.
27. Possible answer: Tests should be conducted on the effects of the crops on the environment and the short- and long-term effects on humans that eat the foods.
28. Since consumers were not buying the smaller cars, manufacturers spent their research dollars on other technologies.
29. Copyrights protect literary and artistic works, whereas patents protect technological inventions.

Applying Math

Math Standards

National: 1, 9

Florida: MA.A.3.4.3

30. \$215.71

Gas-powered car: $(19,000 \text{ km} / 14 \text{ km/L}) \times \$0.53/\text{L} = \$719.21$

Hybrid car: $(19,000 \text{ km} / 20 \text{ km/L}) \times \$0.53/\text{L} = \$503.50$

Cost difference = $\$719.21 - \$503.50 = \$215.71$

31. 407 liters

Gas-powered car: $(19,000 \text{ km} / 14 \text{ km/L}) = 1357 \text{ L}$

Hybrid car: $(19,000 \text{ km} / 20 \text{ km/L}) = 950 \text{ L}$

Fuel difference = $1,357 \text{ L} - 950 \text{ L} = 407 \text{ L}$

Multiple Choice

SC.3.4.3

1. What did Louis Pasteur discover as the cause of infections and diseases?
 - A. bad air
 - B. fleas
 - C. microbes
 - D. rats

Use the photo below to answer question 2.

2. Which technological object would be more valuable to the family shown?
 - A. airline industry
 - B. automobile industry
 - C. the Internet
 - D. medical center

SC.11.3.4.5

3. Which is a technological system for sharing information?
 - A. airline industry
 - B. automobile industry
 - C. the Internet
 - D. medical center
4. What does a society share?
 - A. biotechnology
 - B. consumed goods
 - C. new technologies
 - D. similar values and beliefs

Use the photo below to answer question 5.

5. Which process used by people to influence technological development is shown?
 - A. consumer purchase
 - B. federal spending
 - C. political discussion
 - D. private funding

Gridded Response

6. If a liter of gasoline costs \$0.58 and a car gets 11 km/L, what would it cost to travel 100 km?
7. Assuming that gasoline costs the same as in the previous question, how much would it cost to travel 100 km in a car that gets 6 km/L?

Short Response

Use photo below to answer question 8.

8. Identify one positive and one negative consequence from the use of gasoline-powered cars.

9. How would technological advances in health care benefit people in developing countries?

10. Why were people less concerned about fuel-efficient cars in the past than they are today?
11. What led to laws being created to prevent unethical treatment of animals and humans?
12. How does consumer acceptance affect the development of technology?

Extended Response

SC.H.3.4.1

Use photo below to answer question 13.

13. **Part A** In general, how do scientists and engineers work together to find a technological solution?
- Part B** How would scientists and engineers determine if a new airplane design were more aerodynamic?

Test-Taking Tip

Get plenty of sleep—at least 8 hours every night—during test week and the week before the test.

Short Response

8. Possible answer: positive consequence—ease of transportation; negative consequence—air pollution
9. They would improve the quality of life and increase life expectancy.
10. Gasoline prices were low and fossil fuels consumption was down.
11. Human test subjects have been subjected to experiments against their will and animals have been subjected to unnecessary pain during experiments.
12. If consumers purchase new technologies, additional money is spent on improving the technology. If consumers do not purchase new technologies, companies will not spend additional money on that technology.

Extended Response

13. **Part A:** Scientists and engineers would work together and use a system similar to the scientific method. They would identify the problem, propose solutions, deal with design constraints, comply with laws and regulations, test design ideas, and build prototypes.
- Part B:** They would build a model of the new aerodynamic design and test its capabilities in a wind tunnel where the flow of air around the new design could be measured.

Rubrics

- 3 The Outer Planets
- 4 Life in the Solar System

WebQuest *Roller Coaster Physics* is an investigation of coaster design, laws of motion, gravity, velocity, and acceleration. Students will use virtual programming to engineer, test, and evaluate roller coaster simulations. As a culminating activity, students will create their own roller coaster model and report on their results.

How Are Waffles & Running Shoes Connected?

66

PROJECT CRISS™

Study Skills

Use of Graphics Changing words into pictures enables students to synthesize ideas. After finishing the unit, students in cooperative teams can use large sheets of paper and colored markers to map a selected topic through pictures, words, and diagrams. The various topics could include motion, speed, energy, friction, velocity, force, Newton's laws, inertia, work, and machines. Teams share their free-form maps with the class.

unit projects

Career Have students explore the careers available to mechanical engineers in sports—equipment designer or participant. Have students write an advertisement for their particular sport and its equipment, stating why their friction and aerodynamic design is the best for that sport and its conditions. Some choices include car racing, rollerblading, iceskating, bike racing, skiing, bobsledding, boating, or monster-truck competition.

Technology Ask students to examine, sketch, or do rubbings of a variety of soles of shoes. Have students research and then draw conclusions about how the different treads affect the friction between the shoe and the ground. Have students create a brochure showing five different shoe treads with an explanation about how each type of sole might suit a shoe to a particular activity or environmental condition. Students should analyze how today's technology has made advancements in shoe design, sports, and safety possible.

Model Ask students to design and build a model of a space station on the Moon or a planet in our solar system. Students should research the surface, atmosphere quality, and temperature ranges, as well as the length of day and seasons. Presentation of student models should address each characteristic of the Moon or planet and how the space station's design meets these characteristics.

Additional Resources Visit unit projects at fl.gpscience.com for more information, resources, and assessment rubrics.

For centuries, shoes were made mostly of leather, cloth, or wood. These shoes helped protect feet, but they didn't provide much traction on slippery surfaces. In the early twentieth century, manufacturers began putting rubber on the bottom of canvas shoes, creating the first "sneakers." Sneakers provided good traction, but the rubber soles could be heavy—especially for athletes. One morning in the 1970s, an athletic coach stared at the waffles on the breakfast table and had an idea for a rubber sole that would be lighter in weight but would still provide traction. That's how the first waffle soles were born. Waffle soles soon became a world standard for running shoes.

unit projects

Visit unit projects at fl.gpscience.com to find project ideas and resources. Projects include:

- **Career** Explore the field of mechanical engineering through sports. Create an advertisement for your aerodynamic sports equipment.
- **Technology** Create a brochure showing five different shoe treads with reference to particular sports and environmental conditions.
- **Model** Design and build a model of a space station on the Moon or on a planet in our solar system.

WebQuest Using virtual programming, *Roller Coaster Physics* provides an opportunity to engineer, test, and evaluate roller coaster design, and then build your own three-dimensional coaster.

NATIONAL GEOGRAPHIC

How Are Waffles & Running Shoes Connected?

- Ask students how many of them have slipped when wearing an old pair of running shoes because the tread was worn.
- Have students compare the tread pattern in several pairs of their shoes and hypothesize how each affects friction. Ask them how the intended surface affects what type of tread is on the shoe.

Section Focus

Section Focus Transparency **How about a rematch?** **Level 3**

After a long wait, the tortoise and the hare start a race. The hare bounds far ahead of the tortoise and is sure of victory. He slows down to take a rest. The tortoise passes the hare and continues on.

Why did the hare lose the race?
How does the tortoise's acceleration affect its change in motion?

Level 2

Section Focus Transparency **On the Edge** **Level 3**

While going down a snowy mountain, and down a hill, skiers use their poles and feet to control their speed and direction. Just before the end of the race, the skier's feet are on the edge of the skis. The skier's feet are on the edge of the skis. The skier's feet are on the edge of the skis.

Describe how the skier's velocity changes during the race.
What causes the skier's velocity to increase as he races down the hill?
How does being on the edge of the skis affect the skier's motion?

Level 2

Section Focus Transparency **Yanked Around** **Level 3**

Place some tape pieces on a sheet of paper. If both teams tug equally on the right, the tape should remain in the center. If one team pulls on the upper band, the tape will pull to the center over the time. You have a yank around the center.

Describe how the tape moves as the teams tug on it. Is it pulled toward the center or toward the "yank band" side?
How does the tape move when the teams tug on it? What does it tell you about the forces exerted by the teams?
How does the tape move when the teams tug on it? What does it tell you about the forces exerted by the teams?

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Assessment

Assessment Transparency **Motion, Acceleration, and Forces** **Level 3**

Directions: Identify which picture shows the following quantities.

Some students planned four games of tug-of-war as if they were to predict the outcome of each game. What factor would be important for the students to know in order to make an accurate prediction of the outcome?

- 1. the type of ground surface
- 2. the number of people in each team
- 3. the mass of each person
- 4. the mass of the rope

If all the factors are equal, which picture shows two teams that are the most equal?

If all the factors are equal, which picture shows two teams that are the least equal?

CHAPTER 3 Resource Manager 68D

Science Content Background

Describing Motion

Distance v. Displacement

A vector quantity has both magnitude and direction, such as a displacement of 15 km east and a velocity of 7 m/s west. Scalar quantities have magnitude only, such as a distance of 5 km and a speed of 6 m/s. The terms distance and displacement have different meanings. Consider a car going around a round racetrack. The distance the car travels can be read from its odometer, but the car's displacement is its straight-line distance and direction from its starting point. For each lap the odometer increases. But for each lap its displacement at first increases, and then decreases and becomes zero as it returns to the starting point. Speed and velocity also can be contrasted easily. The car traveling around the track may have a constant speed, but its velocity is constantly changing because its direction is constantly changing.

Acceleration

Acceleration, Speed and Velocity

An object will move with constant velocity unless a force acts on it. A planet orbiting a star experiences the force of gravity between the star and the planet. This force

causes the object to accelerate toward the star and not fly off in straight-line motion.

Acceleration units show changes in velocity divided by time. If velocity is expressed as meters/second and time in seconds, then acceleration is expressed with units of meters per second per second. This is equivalent to m/s/s or $(\text{m/s} \times 1/\text{s})$ or m/s^2 .

Motion and Forces

Air Resistance

When people jump out of high-altitude airplanes, they don't keep accelerating. The faster they fall, the greater the air resistance acting on them, so their acceleration decreases as they fall. Eventually a skydiver stops accelerating and achieves a constant velocity called the terminal velocity. For humans, terminal velocity is about 53 m/s or 190 km/h. It's a good thing a skydiver's velocity slows to only 5 to 10 m/s after the parachute opens!

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that...

Distance and displacement are the same thing.

Speed and velocity are the same thing.

Students are familiar with scalar quantities and vector quantities, but terms such as *displacement* and *velocity* may cause confusion. Also, the term *velocity* is frequently used as though it were the same as *speed*. Finally, the terms *displacement* and *distance* sound similar, which may cause confusion between them.

Discussion

Tell students that a turtle and a hare start a race at the same time. The turtle goes straight to the finish line. The hare starts off and deviates along the way. They both finish the race at the same time. Discuss which had the greatest average speed during the race.

Promote Understanding

Activity

Distance Versus Time

Displacement Versus Time

- Draw the graphs to the left on the board. Explain that the distance-time graph and the displacement-time graph each show Samantha's walking motion after she left her house.
- Ask students to supply a possible story to describe Samantha's motion. Ask them what she might be doing when the lines of both graphs are horizontal.
- Students should see that the distance-time graph and the displacement-time graph for the same motion look very different. In this case the distance traveled is how far Samantha actually walked. Her displacement shows how far she is from her house.
- A plausible story for both graphs is: Samantha walks with constant speed directly away from her house, then rests a bit, and then walks with constant speed directly back to her house. L2

Lab Force and Acceleration

Lab Comparing Motion from Different Forces

Virtual Lab What is the relationship between distance, average speed, and time?

Taking the Plunge

You probably don't think of an amusement park as a physics laboratory. The fast speeds, quick turns, and plunging falls are a great place to study the laws of gravity and motion. In fact, engineers use these laws when they are designing and building amusement park rides.

Science Journal Write a paragraph describing three rides in an amusement park and how the rides cause you to move.

68

Theme Connection

Stability and Change An object will have a constant velocity unless the object is acted upon by an unbalanced outside force.

About the Photo

Amusement Park Physics The fast speeds, sharp turns, and plunging falls in amusement park rides may seem dangerous, but they are very safe. Engineers use the laws of motion to design the rides so that the passengers experience the thrill but are not in danger of getting hurt.

Start-Up Activities

Compare Speeds

A cheetah can run at a speed of almost 120 km/h and is the fastest runner in the world. A horse can reach a speed of 64 km/h; an elephant's top speed is about 40 km/h; and the fastest snake slithers at a speed of about 3 km/h. The speed of an object is calculated by dividing the distance the object travels by the time it takes it to move that distance. How does your speed compare to the speeds of these animals?

1. Use a meterstick to mark off 10 m.
2. Have your partner use a stopwatch to determine how fast you run 10 m.
3. Divide 10 m by your time in seconds to calculate your speed in m/s.
4. Multiply your answer by 3.6 to determine your speed in km/h.
5. **Think Critically** Write a paragraph in your Science Journal comparing your speed with the maximum speed of a cheetah, horse, elephant, and snake. Could you win a race with any of them?

Scienceonline

FOLDABLESTM Study Organizer

Motion Many things are in motion in your everyday life. Make the following Foldable to help you better understand motion as you read the chapter.

- STEP 1** Fold a sheet of paper in half lengthwise. Make the back edge about 1.25 cm longer than the front edge.

- STEP 2** Fold in half, then fold in half again to make three folds.

- STEP 3** Unfold and cut only the top layer along the three folds to make four tabs.

- STEP 4** Label the tabs.

Identify Questions Before you read the chapter, select a motion you can observe and write it under the left tab. As you read the chapter, write answers to the other questions under the appropriate tabs.

Purpose Use the Launch Lab to introduce students to the relationship between motion and speed. **L2** **KS** **Kinesthetic**

Preparation Find a location outside where groups of students will have room to mark off their 10-m distances. Assign each group a specific location.

Materials meterstick, stopwatch, calculator

Teaching Strategy Stage a contest between the five students with the greatest speeds to determine the fastest student in the class. Post the top speeds on a classroom bulletin board.

Think Critically

Students would lose races with a cheetah, horse, or elephant. They would win races with a snake.

Assessment

Oral Have students infer a formula for determining the speed of moving objects. Use **Performance Assessment in the Science Classroom**, p. 101.

Tie to Prior Knowledge

Speed Limits Ask students to name the speed limits near the school, near their homes, or on an interstate highway. Discuss with students the units, such as miles per hour or kilometers per hour, used in speed limits. Tell students they will learn about measuring speed. L1

Facets of Meaning Have students predict meaning for new vocabulary. The words will be familiar in an everyday sense, such as *speed* meaning "swiftness." In physics, however, the definitions may differ. Point out that *speed* in physics means "distance traveled divided by the time traveled."

Reading Guide

FCAT Vocabulary

What You'll Learn

- Distinguish between distance and displacement.
- Calculate average speed.
- Explain the difference between speed and velocity.
- Interpret motion graphs.

Why It's Important

Understanding the nature of motion and how to describe it helps you understand why motion occurs.

Review Vocabulary

instantaneous: occurring at a particular instant of time

New Vocabulary

- displacement
- vector
- speed
- instantaneous speed
- average speed
- velocity

Motion

Every day you see objects and people in motion. Cars, buses, and trucks move along streets and highways. People around you walk and run and move in different directions. How would you describe the motion of the people and objects around you? One way to describe motion is to say that it is fast or slow. However, sometimes you might need to know the speed of an object, as well as the direction in which it is moving. It also might be important to know how the motion of something is changing.

Motion is a Change in Position You don't always need to see something move to know that motion has taken place. For example, suppose you see a mail truck stopped next to a mailbox, as in **Figure 1**. A little while later, you see the same truck stopped farther along the street. Although you didn't see the truck move, you know it moved because its position relative to the mailbox changed. Motion occurs when an object changes position.

Position Depends on a Reference Frame To measure the position of an object, a reference frame must be chosen. A reference frame is a group of objects that are not moving relative to each other. One point in the reference frame is chosen as the reference point. Then the position of an object is the distance and the direction of the object from the reference point. For example, in **Figure 1** the mailbox, the tree, and the houses can form a reference frame because they aren't moving relative to each other.

Figure 1 This mail truck is in motion.

Infer How do you know the mail truck has moved?

- MiniLAB, p. 3

Mathematics Skill Activities, p. 11

Physical Science Critical Thinking/Problem Solving, p. 2

Life Science Critical Thinking/Problem Solving, p. 14

Motion is Relative The motion of an object depends on the reference frame that is chosen. For example, suppose you are sitting in a moving car. You are not moving if the car is the reference frame, but you are moving relative to the ground. Using the Sun as a reference frame, Earth is moving at a speed of 30 km/s. However, the Sun also is moving relative to a reference frame centered on the Milky Way Galaxy. Your motion would be different in each of these reference frames. However, there is no special reference frame that really is at rest compared to all other reference frames. As a result, an object does not have absolute motion, but only motion relative to a chosen reference frame.

Distance and Displacement Suppose a runner jogs to the 50-m mark and then turns around and runs back to the 20-m mark, as shown in **Figure 2**. How far did the runner travel? For a moving object, distance is the length of the path the object travels. The runner traveled a distance of 50 m plus 30 m, or 80 m. However, even though she ran 80 m, she is only 20 m from the starting line. Her final position is 20 m north of her initial position. **Displacement** is the distance and direction of an object's final position from its initial position. The runner's displacement is 20 m north.

Displacement includes both a size and a direction. The size of the displacement is the distance between the initial and final position. A quantity that is specified by both a size and a direction is a **vector**. Displacement includes both a size and a direction and is an example of a vector. However, distance is a physical quantity that does not include a direction and isn't a vector.

Reading Check How do distance and displacement differ?

Speed

To describe how fast something is moving, you need to know how far it travels in a given amount of time. **Speed** is the distance an object travels per unit of time. In SI units, the unit of speed is meters per second (m/s). Usually the speed of an object changes as it moves from one place to another.

One way to describe the speed of an object is to measure its speed at a single instant of time. The **instantaneous speed** of an object is the speed at a single instant of time. A car's speedometer measures the instantaneous speed of the car.

Mini LAB

Measuring Average Speed

Procedure

1. Mark a starting point on the floor with **tape**. Place a **toy car** at the starting point.
2. Give the toy car a gentle push forward. At the same time, start a **stopwatch**.
3. Record the time it takes for the car to come to a stop.
4. Use a **meterstick** to measure the distance the car traveled.

Analysis

Calculate the average speed of the car in m/s. How does the average speed depend on the direction of motion?

Figure 2 The runner's displacement is 20 m north of the starting line. However, the total distance traveled is 80 m.

SECTION 1 Describing Motion 71

Visual Learning

Figure 2 Help students understand the information presented in **Figure 2**. As you read the description from the text, have these students follow the path of the runner with their fingers. Then ask the students how far the runner ran and how far she is from the starting line. 80 m; 20 m **L2**

Caption Answer

Figure 1 Its position relative to the mailbox changed.

Use Science Words

Word Usage Students may have difficulty with the term *relative* when it is used to describe an object's motion or position. Have them discuss what the word means. Possible answers are "dependent upon" or "with reference to." **L1 ELL LS Linguistic**

Mini LAB

Purpose Students will calculate the average speed of a car. **L2**

Materials tape, toy car, stopwatch, pencil, meterstick

Teaching Strategy Try to use cars that will travel in a straight line when pushed gently.

Analysis

average speed = distance/time; The speed would be the same if the car traveled in the opposite direction.

Assessment

Process Have students use their observations to hypothesize why the car eventually comes to a rest. Use **Performance Assessment in the Science Classroom**, p. 93.

Reading Check

Answer Distance describes how far an object has moved; displacement includes distance and direction of an object's change in position from its starting point.

IDENTIFYING Misconceptions

Word Differences Students may think that distance and displacement are the same. They may also think speed and velocity are the same. Refer to page F at the beginning of this chapter for teaching strategies that address this misconception.

Activity

Different Rates Review the concept of rate by having students measure their breathing rates. Discuss other rates, such as heart rate (pulse) and interest rates. Discuss the units that describe these rates and point out similarities in the units. They are all a number of something per time.

L2 **LS** Logical-Mathematical

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

Answers to Practice Problems

1. 8.0 m/s

2. 0.25 h or 15 min

Use an Analogy

Lined Paper Explain to students that using a reference point to describe motion is analogous to using lines on paper to write. The lines on the paper provide a reference point to keep your writing on a straight line. **L2**

Scienceonline

Topic: Running Speeds

Visit fl.gpscience.com for Web links to information about the speeds of various animals.

Activity Make a table comparing the top speed of various animals.

Average Speed Another way to describe the motion of an object is to determine the object's average speed. The average speed describes how quickly an object moved over the entire distance it traveled. The **average speed** of any object is the total distance traveled divided by the total travel time:

Average Speed Equation

$$\text{average speed (in meters/second)} = \frac{\text{total distance (in meters)}}{\text{total time (in seconds)}}$$

$$\bar{v} = \frac{d}{t}$$

The units of average speed are always a distance unit divided by a time unit. Sometimes it is more convenient to express average speed in units other than m/s, such as kilometers per hour (km/h).

Applying Math

Solve a One-Step Equation

AVERAGE SPEED What is the average speed of a car that travels a distance of 750 m in 25 s?

IDENTIFY known values and the unknown value

Identify the known values:

travels a distance of 750 m $\rightarrow d = 750 \text{ m}$
in 25 s $\rightarrow t = 25 \text{ s}$

Identify the unknown value:

What is the average speed? $\rightarrow \bar{v} = ? \text{ m/s}$

SOLVE the problem

Substitute the given values of distance and time into the average speed equation:

$$\bar{v} = \frac{d}{t} = \frac{750 \text{ m}}{25 \text{ s}} = 30 \text{ m/s}$$

CHECK your answer:

Does your answer seem reasonable? Check your answer by multiplying the time by the average speed. The result should be the distance given in the problem.

Practice Problems

1. An elevator travels a distance of 220 m from the first floor to the 60th floor in 27.5 s. What is the elevator's average speed?
2. A motorcyclist travels with an average speed of 20 km/h. If the cyclist is going to a friend's house 5 km away, how long does it take the cyclist to make the trip?

For more practice problems, go to page 879 and visit Math Practice at fl.gpscience.com.

Cultural Diversity

The Olympics Runners from all over the world participate in track and field events in the Olympics every four years. Have students research the winners and their times and speeds for a track and field event of their choice for the past five summer Olympics. They should combine their research into a bulletin board display and creatively relate it to information in this chapter. **L2**

Differentiated Instruction

Learning Disabled Perform the calculations for determining average speed on the board to help students understand the process before doing it themselves. After you have done the procedure several times, ask students to do the calculations on their own. **L2**

Velocity

You turn on the TV and see a news story about a hurricane, such as the one in **Figure 3**, that is approaching land with a speed of 10 km/h. The eye of the hurricane is located 450 km east of your location. Should you take shelter?

If you know only the hurricane's speed and location, you don't have enough information to answer the question. To decide whether the hurricane will reach your location, you need to know the direction in which the storm is moving. In other words, you need to know the velocity of the hurricane. The **velocity** of an object is the speed of the object and its direction of motion. Just like displacement, velocity is a vector that has a size and a direction. The size of an object's velocity is the object's speed.

Objects have different velocities if they are moving at different speeds, or in different directions. The people on the up escalator and the down escalator in **Figure 4** are moving with the same speed, but in opposite directions. As a result, the people on the up escalator and the down escalator have a different velocity.

The velocity of an object can change even if the speed of the object remains constant. For example, look at **Figure 4**. The race car has a constant speed as it goes around an oval track. Even though the speed remains constant, the velocity changes because the direction of the car's motion is changing.

Figure 3 The speed of a hurricane is not enough information to plot the hurricane's path. The direction of its motion also must be known.

Figure 4 The velocity of an object depends on both its speed and its direction of motion.

Describe how the car's velocity changes as the car travels from the starting line to the top of the figure.

Reading Check How are velocity and speed different?

The people on these two escalators have the same speed. However, their velocities are different because they are traveling in opposite directions.

The velocity of this car changes because its direction of motion is changing.

Differentiated Instruction

English-Language Learners Have students cut photographs out of magazines showing some type of motion. Have students create a decorative collage of their photos. **L1 P**

Curriculum Connection

Geography Geographers use lines of latitude and longitude to help them describe displacement on Earth. Have students find out how early seafarers determined their latitude and longitude. To find their latitude they used the positions of the stars and the Sun. They had no way to determine longitude until an accurate chronometer was developed in the mid-1700s. **L3 IS**

Linguistic

Quick Demo

Car Ramps

Materials three ramps of various lengths at least 2 m long, toy car, stopwatch, meterstick

Estimated Time 15 minutes

Procedure Make three ramps of various lengths, each at least 2 m long. Start a toy car rolling down one of the ramps. Time the car's motion with a stopwatch. Measure the distance covered by the car. Write the distance traveled and time elapsed on the board. Repeat the activity with each of the three ramps. Have students determine the average speed for the three runs by dividing the total distance traveled by the total time.

L2

Discussion

Speed Units Remind students that when the equation for speed is rearranged, we have $t = d/v$. How do time units emerge from this equation? $m / (m/s) = m \times s/m = s$

Reading Check

Answer Velocity includes direction; speed does not.

Virtual Labs

$d = st$ What is the relationship between distance, average speed, and time?

Caption Answer

Figure 4 The velocity is to the right at the start line and to the left at the top of the figure. The magnitude of the velocity does not change.

IDENTIFYING Misconceptions

Average Speed Students sometimes interpret the height of a distance-time graph as its slope. The steepness of the straight line of a distance-time graph is the slope. This shows the average speed. The height of the line is the farthest distance the object has traveled in the positive direction.

Visual Learning

Figure 5 In addition to finding the average speed over the entire 30-min period, students can find the average speed over any time period by dividing the change in distance during the period by the amount of time. What is Julie's average speed during the period 15 min to 25 min? **40 m/min** Students should also notice that the instantaneous speed at any point in time is the slope of the line at that point. What is the instantaneous speed of Mary at $t = 5$ min? **80 m/min** **L2** **LS** **Visual-Spatial**

Caption Answer

Figure 5 On Julie's graph there is a slope of zero between 10 min and 20 min, which represents a speed of 0 m/min.

Orbital Speeds The average orbital speed of a planet decreases as the radius of the orbit increases.

Research Have students investigate how astronomers study planets outside the solar system. Ask students to present their findings to the class in an oral report.

Figure 5 The slope of a line on a distance-time graph gives the speed of an object in motion. **Identify** the part of the graph that shows one of the swimmers resting for 10 min.

Graphing Motion

The motion of an object over a period of time can be shown on a distance-time graph. Time is plotted along the horizontal axis of the graph and the distance traveled is plotted along the vertical axis of the graph. If the object moves with constant speed, the increase in distance over equal time intervals is the same. As a result, the line representing the object's motion is a straight line.

For example, the graph shown in **Figure 5** represents the motion of three swimmers during a 30-min workout. The straight red line represents the motion of Mary, who swam with a constant speed of 80 m/min over the 30-min workout. The straight blue line represents the motion of Kathy, who swam with a constant speed of 60 m/min during the workout.

The graph shows that the line representing the motion of the faster swimmer is steeper. The steepness of a line on a graph is the slope of the line. The slope of a line on a distance-time graph equals the speed. A horizontal line on a distance-time graph has zero slope, and represents an object at rest. Because Mary has a larger speed than Kathy, the line representing her motion has a larger slope.

Orbital Speeds Size, mass, composition, and orbital radius are some of the ways astronomers classify planets. Astronomers also measure the speed of a planet relative to the Sun. Make a table of the average orbital speeds and orbital radii of the nine planets in the solar system. How are distance from the Sun and orbital speed related?

Teacher FYI

Vertical Speed It is impossible to have a vertical line on a distance-time graph. It would mean the object moved a distance in zero time. To do this, the object would have to go infinitely fast.

Reading Strategy

Clarify Text After students read this page, have them clarify the meanings of *instantaneous speed*, *average speed* and *velocity* by providing examples of each term. Students should share examples with the class and chart ideas to display in the classroom.

Changing Speed The green line represents the motion of Julie, who did not swim at a constant speed. She covered 400 m at a constant speed during the first 10 min, rested for the next 10 min, and then covered 800 m during the final 10 min. During the first 10 min, her speed was less than Mary's or Kathy's, so her line has a smaller slope. During the middle period her speed is zero, so her line over this interval is horizontal and has zero slope. During the last time interval she swam as fast as Mary, so that part of her line has the same slope.

Plotting a Distance-Time Graph On a distance-time graph, the distance is plotted on the vertical axis and the time on the horizontal axis. Each axis must have a scale that covers the range of numbers to be plotted. In **Figure 5** the distance scale must range from 0 to 2,400 m and the time scale must range from 0 to 30 min. Then, each axis can be divided into equal time intervals to represent the data. Once the scales for each axis are in place, the data points can be plotted. After plotting the data points, draw a line connecting the points.

Science

Topic: Olympic Swimming Speeds

Visit fl.gpscience.com for Web links to information about the speeds of Olympic swimmers over the past 60 years.

Activity Make a speed year graph showing the swimming speeds over time. Are there any trends in the speed data?

Post Reading

Graphs Have students create their own distance v. time graphs to demonstrate an object's motion. Graphs should be annotated with a written description.

3 Assess

DAILY INTERVENTION

Check for Understanding

Linguistic Have students write a short narrative that could be used to explain the difference between distance and displacement to a younger sibling or to someone in the class that doesn't understand the difference. **L2**

Reteach

Calculating Average Speed Have students calculate the average speed of a windup or battery-operated toy car using metersticks and a wall clock. **L2** **LS** **Logical-Mathematical**

Assessment

Process Provide students with the following problem: Suppose a bus is traveling through the city. It travels 100 km in the first 2 h and 120 km in the second 2 h. It stops for 1 h, then it finishes the route by going 100 km in 2 h. Draw a distance-time graph of the bus's motion.

Answer:

Use PASC, p. 111. **L2**

section 1 review

Summary

Position and Motion

- The position of an object is determined relative to a reference point.
- Motion occurs when an object changes its position relative to a reference point.
- Distance is the length of the path an object has traveled. Displacement is the distance and direction of a change in position.

Average Speed and Velocity

- Average speed is the total distance traveled divided by the total time:
$$\bar{v} = \frac{d}{t}$$
- The velocity of an object includes the object's speed and its direction of motion relative to a reference point.

Graphing Motion

- On a distance-time graph, time is the horizontal axis and distance is the vertical axis.
- The slope of a line plotted on a distance-time graph is the speed.

Self Check

1. **Infer** whether the size of an object's displacement could be greater than the distance the object travels.
2. **Describe** the motion represented by a horizontal line on a distance-time graph.
3. **Explain** whether, during a trip, a car's instantaneous speed can ever be greater than its average speed.
4. **Describe** the difference between average speed and constant speed.
5. **Think Critically** You are walking toward the back of a bus that is moving forward with a constant velocity. Describe your motion relative to the bus and relative to a point on the ground.

Applying Math

6. **Calculate Average Speed** Michiko walked a distance of 1.60 km in 30 min. Find her average speed in m/s.
7. **Calculate Distance** A car travels at an average speed of 30.0 m/s for 0.8 h. Find the total distance traveled in km.

section 1 review

1. No. The displacement equals the distance only if the object moves in a straight line in a single direction. Otherwise, the displacement is less than the distance.
2. The slope is zero, corresponding to a speed of zero.
3. Yes. The instantaneous speed at various times can be greater or less than the average speed.
4. Average speed is total distance traveled divided by total time; the instantaneous speed can be changing. Constant speed means that the instantaneous speed doesn't change.
5. Relative to the bus, you move back-

ward at your walking speed. Relative to the ground, you move in the same direction as the bus with a speed equal to the bus speed minus your walking speed.

6. 0.89 m/s

7. 86.4 km

Tie to Prior Knowledge

Floor It Have a student explain the phrase "stepping on the gas." Relate the function of the accelerator to the motion of a car. L2

Activate Background Knowledge

Have students write what they know about *acceleration*. Introduce the physics definition: *acceleration is the change in velocity divided by the time it takes for the change to occur*. Discuss how this definition is similar to or different from their preconceived ideas of acceleration.

Reading Guide

What You'll Learn

- **Identify** how acceleration, time, and velocity are related.
- **Describe** how to calculate the average acceleration of an object.
- **Explain** how positive and negative acceleration affect motion.

Why It's Important

Acceleration occurs all around you as objects speed up, slow down, or change direction.

Review Vocabulary

velocity: a vector with a size that is an object's speed and a direction that is the direction of an object's motion

New Vocabulary

- acceleration

Acceleration, Speed, and Velocity

A car at a stoplight starts moving when the light finally turns green. When the car started moving, the car's velocity increased and the car was accelerating. **Acceleration** is the change in velocity divided by the time for the change to occur.

Remember that velocity is a vector that includes both the speed and direction of motion. So a change in velocity can either be a change in speed or a change in direction of motion. Acceleration occurs when the speed of an object changes or its direction of motion changes.

Reading Check When does acceleration occur?

Just as velocity has a size and direction, acceleration also is a vector that has a size and direction. **Figure 6** shows how acceleration can cause an object to speed up or slow down.

Figure 6 These cars are both accelerating because their speed is changing.
Infer how the car would move if its acceleration were zero.

✓ Reading Check

Answer Acceleration occurs whenever there is a change in speed or direction of motion.

Caption Answer

Figure 6 The car would move with a constant velocity.

Integrate History

Aircraft Carriers The U.S. Navy was not alone in the development of aircraft carriers. During World War I, the British navy converted a merchant-ship hull into the first aircraft carrier with an unobstructed flight deck, the HMS *Argus*. The first U.S. carrier, the USS *Langley*, joined the fleet in March 1922. The Japanese built the first carrier from the keel up, the *Hosyo*. It entered service in December 1922. Modern carriers provide accelerations between 30 m/s^2 and 40 m/s^2 , or three to four gs.

Discussion

Acceleration Tell students that, as in the case of speed and velocity, acceleration can be constant or changing, and one can measure instantaneous acceleration as well as average acceleration. Ask students to give examples of constant acceleration, instantaneous acceleration, and average acceleration. **constant acceleration**—free fall; **instantaneous acceleration**—the acceleration of a falling rock after it has been falling for 3 s; **average acceleration**—final velocity of the falling rock when it hits the ground divided by the total time it was falling **L3**

IS Logical-Mathematical

Figure 7 The speed of each horse on this carousel is constant but each is accelerating because the direction of its velocity is changing.

Integrate History

Aircraft Carriers In 1911, American pilot Eugene Ely successfully landed on a specially equipped deck on the battleship *Pennsylvania*. Today, huge aircraft carriers provide floating landing strips for military airplanes. Carriers must be equipped to provide large accelerations, both positive and negative, to the jets launched from their decks. Research the accelerations provided by modern carriers as they launch and land aircraft.

Changing Direction A change in velocity can be either a change in how fast something is moving or a change in the direction of movement. Any time a moving object changes direction, its velocity changes and it is accelerating. Think about a horse on a carousel. Although the horse's speed remains constant, the horse is accelerating because it is changing direction constantly as it travels in a circular path, as shown in **Figure 7**. Another example is the motion of Earth around the Sun in a nearly circular path. As a result, the direction of Earth's velocity is continually changing. This means that Earth is accelerating as it orbits the Sun.

Calculating Acceleration

When an object moves from one place to another, it might speed up, slow down, and change direction many times. Each change in velocity causes the acceleration of the object to change. When acceleration is changing, the size of the average acceleration over some period of time can be calculated. If the direction of motion of an object doesn't change, the size of its average acceleration can be calculated using the following equation:

Acceleration Equation

$$\text{average acceleration (in m/s}^2\text{)} = \frac{(\text{final velocity (in m/s)} - \text{initial velocity (in m/s)})}{(\text{final time (s)} - \text{initial time (s)})}$$

$$\bar{a} = \frac{(v_f - v_i)}{(t_f - t_i)}$$

In this equation, v_i is the size of the velocity at the start of the time period and v_f is the size of the velocity at the end of the time period. For motion in a single direction, v_i is the same as the initial speed, and v_f is the same as the final speed. In SI units, acceleration has units of m/s^2 —meters per second squared. An acceleration of 1 m/s^2 means that the velocity of the object increases by 1 m/s each second. If the object was initially at rest, its velocity would be 1 m/s after 1 s , 2 m/s after 2 s , and so on.

Speed-Time Graphs For an object moving in one direction, the acceleration can be found from a speed-time graph. For this type of graph, the vertical axis is the object's speed and the horizontal axis is the time. Then the slope of the plotted line is the size of the object's acceleration. **Figure 8** shows some examples of speed-time graphs.

Curriculum Connection

Physical Education Most sports rely on the ability of people to make quick changes in acceleration. Have students find out some of the equipment used in different sports to make acceleration easier. **starting blocks for runners and swimmers; cleats on shoes for runners, soccer players, football players, and baseball players; rubber-soled shoes for basketball players; special clothing for reducing wind resistance for all racers** **L2**

Reading Strategy

Dialogue with the Text As students read Calculating Acceleration, have them write down questions or ideas for the author. For instance, a student might ask the author: Why is it important to know these concepts? More specifically, why do you say to subtract final velocity from initial velocity?

Visualizing Acceleration

Have students examine the pictures and read the captions. Then ask the following questions.

In the graphs for A, B, and C, how are the slopes of the lines and the accelerations of the objects related? The slope of the line is positive if acceleration is positive, negative if acceleration is negative, and zero if there is no acceleration.

In the graph for B, what is the numerical value of the acceleration of the ball? The numerical value is the same as the acceleration due to gravity, 9.8 m/s^2 .

What is the relationship between the graphs for B and C? The acceleration of both balls is due to the pull of gravity. Graph B has a positive acceleration due to gravity or $+9.8 \text{ m/s}^2$ and graph C has a negative acceleration due to gravity or -9.8 m/s^2 .

Activity

Rap Songs Have students work in pairs to make up rap songs containing descriptions of the relationship between different types of acceleration and their corresponding graphs. **L2 LS**
Auditory-Musical

Teacher FYI

Feeling Acceleration In the aerospace industry, the accelerations experienced by astronauts and pilots are often expressed as multiples of g . The acceleration, caused by gravity (g), acting on an object falling freely near Earth's surface is about 9.78 m/s^2 . Vertical accelerations as low as $3 g$ can cause pilots to black out.

Figure 8

A cceleration can be positive, negative, or zero depending on whether an object is speeding up, slowing down, or moving at a constant speed. If the speed of an object is plotted on a graph, with time along the horizontal axis, the slope of the line is related to the acceleration.

A The car in the photograph on the right is maintaining a constant speed of about 90 km/h . Because the speed is constant, the car's acceleration is zero. A graph of the car's speed with time is a horizontal line.

B The green graph shows how the speed of a bouncing ball changes with time as it falls from the top of a bounce. The ball speeds up as gravity pulls the ball downward, so the acceleration is positive. For positive acceleration, the plotted line slopes upward to the right.

C The blue graph shows the change with time in the speed of a ball after it hits the ground and bounces upward. The climbing ball slows as gravity pulls it downward, so the acceleration is negative. For negative acceleration, the plotted line slopes downward to the right.

Differentiated Instruction

Challenge Have students find out what type of information can be obtained by finding the area under a speed-time graph. Explain why this could be a useful tool for scientists. Construct a speed-time graph and find the distance traveled by the object. The numerical value of the area under a speed-time graph is the distance traveled by the object. **L3 P LS**
Logical-Mathematical

Visually Impaired Have a student helper read the text for each graph. Have the helper move his or her finger along the graph while the other student gently lays his or her hand on top of the helper's hand. This can help the visually-impaired student "see" the graph.

Calculating Positive Acceleration How is the acceleration for an object that is speeding up different from that of an object that is slowing down? Suppose the jet airliner in **Figure 9** starts at rest and moves down the runway in a single direction. After accelerating for 20 s, it reaches a speed of 80 m/s. Because it started from rest, its initial speed was zero. The jetliner's average acceleration can be calculated as follows:

$$\bar{a} = \frac{(v_f - v_i)}{(t_f - t_i)} = \frac{(80 \text{ m/s} - 0 \text{ m/s})}{20 \text{ s}} = 4 \text{ m/s}^2$$

The airliner is speeding up, so the final speed is greater than the initial speed and the acceleration is a positive number.

Calculating Negative Acceleration Now imagine that the skateboarder in **Figure 9** is moving in a straight line at a constant speed of 3 m/s and comes to a stop in 2 s. The final speed is zero and the initial speed was 3 m/s. The skateboarder's acceleration is calculated as follows:

$$\bar{a} = \frac{(v_f - v_i)}{(t_f - t_i)} = \frac{(0 \text{ m/s} - 3 \text{ m/s})}{2 \text{ s}} = -1.5 \text{ m/s}^2$$

The skateboarder is slowing down, so the final speed is less than the initial speed and the acceleration is a negative number. For an object moving in one direction, the acceleration will be a positive number if an object is speeding up and a negative number if the object is slowing down.

Figure 9 A speed-time graph tells you if acceleration is a positive or negative number. **Infer** what a steeper slope indicates on a speed-time graph.

Visual Learning

Figure 9 Review with students the graphs in **Figure 9**. Then ask a volunteer to draw on the board the speed-time graph for a car that starts at 0 km/h, accelerates to 30 km/h over a period of 2 min, runs at 30 km/h for 10 min, then takes 30 s to stop. **L2**

Quick Demo Sphere Acceleration

Materials about 2 m of clear-plastic tubing, small spheres that can freely roll through tubing

Estimated Time 10 minutes

Procedure Have two students hold the tubing in a U-shape. Put a sphere in one end of the tubing. Point out to the students that the sphere has positive acceleration as it rolls downhill in the tubing. The sphere has negative acceleration as it starts to go uphill in the tubing.

Caption Answer

Figure 9 A steeper slope means a larger acceleration.

Post Reading

Extended Research Ask students to research roller coaster design. Have them develop a poster or written report that explains how design is tied to acceleration. Suggest that they use design information from existing roller coasters to support their ideas.

LAB DEMONSTRATION

Purpose to demonstrate making a table and graph from distance-time measurements

Materials 8 socks, stopwatch, meterstick

Preparation Mark a starting line where you have room to walk.

Procedure Begin walking slowly, then steadily increase your speed. Drop a sock

every 3 s. Measure the distance from the starting line to each sock. On the board, make a table and a distance-time graph of the data.

Expected Outcome The distance between socks will increase for each 3-s interval.

Teaching Strategy Reassure students that

walking speeds vary and any distance interval they measure is acceptable.

Assessment

What is the slope of the line after 6 s? **The slope will vary with the data.** What does this show? **speed** Use PASC, p. 111. **L2**

✓ Reading Check

Answer They are accelerated.

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Have students work in groups to discuss acceleration experienced by a tennis ball as it is dropped and bounces. Because the velocity of the ball changes direction as it bounces, students must include the direction of the ball's motion when they calculate acceleration. If down is the positive direction, the ball's acceleration is positive when it falls. When the ball rises, its velocity becomes less negative as it moves upward, so its acceleration is positive. When the ball is in contact with the floor, its acceleration is negative as it slows down in the positive (down) direction, and then speeds up in the negative (up) direction. Have students make a labeled poster illustrating the tennis ball's positive then negative acceleration cycle—a pattern that repeats itself with each bounce. **L3** **COOP LEARN** **P** **LS**
Interpersonal

Reteach

Have students demonstrate three ways to accelerate while walking: speeding up, slowing down, changing direction **L1** **LS** **Kinesthetic**

✓ Assessment

Process Think about how motion is affected by gravitational acceleration. Water on Earth falls from a waterfall with an acceleration of 9.8 m/s^2 . The gravity of Mars is two-fifths that of Earth. If water were on the surface of Mars, would water fall from a waterfall faster, more slowly, or at the same rate? **more slowly.** Use **Performance Assessment in the Science Classroom**, p. 89. **L2**

Figure 10 Cars on this roller coaster can reach a speed of about 150 km/h in 4 s.

Amusement Park Acceleration

Riding roller coasters in amusement parks can give you the feeling of danger, but these rides are designed to be safe. Engineers use the laws of physics to design amusement park rides that are thrilling, but harmless. Roller coasters are constructed of steel or wood. Because wood is not as rigid as steel, wooden roller coasters do not have hills that are as high and steep as some steel roller coasters have. As a result, the highest speeds and accelerations usually are produced on steel roller coasters.

Steel roller coasters can offer multiple steep drops and inversion loops, which give the rider large accelerations. As the rider moves down a steep hill or an inversion loop, he or she will accelerate toward the ground due to gravity. When riders go around a sharp turn, they also are accelerated. This acceleration makes them feel as if a force is pushing them toward the side of the car. **Figure 10** shows the fastest roller coaster in the United States.

✓ Reading Check

What happens when riders on a roller coaster go around a sharp turn?

section 2 review

Summary

Acceleration, Speed, and Velocity

- Acceleration is the change in velocity divided by the time needed for the change to occur.
- A change in velocity occurs when an object changes its speed or direction of motion.
- The speed of an object increases if the acceleration is in the same direction as the velocity.
- The speed of an object decreases if the acceleration and the velocity of the object are in opposite directions.

Calculating Acceleration

- The average acceleration of an object can be calculated using this equation:

$$\bar{a} = \frac{(v_f - v_i)}{(t_f - t_i)}$$

- When an object moving in a straight line speeds up, its acceleration is positive
- When an object moving in a straight line slows down, its acceleration is negative.

Self Check

1. **Determine** whether you are accelerating as Earth rotates once every 24 h.
2. **Determine** the change in velocity of a car that starts at rest and has a final velocity of 20 m/s north.
3. **Explain** why streets and highways have speed limits rather than velocity limits.
4. **Describe** the motion of an object that has an acceleration of 0 m/s^2 .
5. **Think Critically** Suppose a car is accelerating so that its speed is increasing. Describe the plotted line of the motion of the car on a distance-time graph.

Applying Math

6. **Calculate Acceleration** A ball is dropped from a cliff and reaches a speed of 29.4 m/s after 3.0 s. What is the ball's average acceleration?
7. **Calculate Speed** A sprinter runs with an average acceleration of 4.5 m/s^2 . What is the sprinter's speed 2 s after leaving the starting blocks?

section 2 review

1. Yes, you are accelerating.
2. 20 m/s north
3. Velocity includes direction, so to have a velocity limit there would have to be some limit as to the direction in which a car was moving, as well as speed.
4. It's moving in a straight line with constant speed.
5. The plot would be a curved line sloping upward whose slope is increasing.

6. 9.8 m/s^2
7. 9.0 m/s

 **MA.B.1.4.2**

Motion and Forces

Reading Guide

What You'll Learn

- **Explain** how forces and motion are related.
- **Compare and contrast** static friction and sliding friction.
- **Describe** the effects of air resistance on falling objects.

Why It's Important

All changes in motion are caused by the forces that act on objects.

Review Vocabulary

vector: a quantity that includes both a size and a direction

New Vocabulary

- force
- net force
- balanced forces
- unbalanced forces
- friction
- static friction
- sliding friction
- air resistance

What is force?

When you shoot a basketball or kick a soccer ball, you are exerting a force on an object. In fact, every push or pull you exert results in a force being applied to some object. A **force** is a push or pull that one object exerts on another. Just like velocity and acceleration, force also is a vector that has a size and a direction. The size of a force often is called the strength of the force. The direction of a force is the direction in which the push or pull is applied. For example, when you lift your backpack, you apply an upward force. In SI units, force is measured in newtons (N). You have to apply a force of about 3 N to lift a full can of soft drink.

Changing Motion What happens to the motion of an object when you exert a force on it? A force can cause the motion of an object to change, as in **Figure 11**. The racket strikes the ball with a force that causes the ball to stop and then move in the opposite direction. If you have played billiards, you know that you can cause a ball at rest to roll into a pocket by striking it with another ball. The force applied by the moving ball causes the ball at rest to move in the direction of the force. In these cases, the velocities of the tennis ball and the billiard ball were changed by a force.

Figure 11 This ball is hit with a force. The racket strikes the ball with a force in the opposite direction of its motion. As a result, the ball changes the direction it is moving.

Changing Velocity Ask students to describe things they could do to change the velocity of a soccer ball. Point out that in each case, they are using a push or a pull to change the ball's motion. Tell students that pushing and pulling are forces, and this section discusses how forces change an object's motion. L2

Visualizing Text Have students choose two new vocabulary words to visualize and illustrate. For instance, for *force* students might think of a falling acorn hitting the ground. For *balanced forces*, they might visualize two people pushing on opposite sides of a box with the same force.

✓ Reading Check

Answer Student answers will vary. possible answers: force of gravity on a falling object

Quick Demo

Upward and Downward

Forces

Materials spring scale, objects with various masses

Estimated Time 10 minutes

Procedure Hold up a spring scale and hang objects of different masses from it. Have a student read the force required to hold up each object. Explain that the upward force exerted by the spring of the spring scale balances the downward gravitational force on the object.

IDENTIFYING

Misconceptions

Balanced Forces The point to emphasize is that a condition of zero velocity (constant velocity of zero) is not any different, in terms of net force acting on the object, than an object moving at a constant, non-zero velocity. Explain that any constant velocity means that the forces acting on the object are balanced.

Make a Model

Rough Surfaces Students can use modeling clay to show how two surfaces that appear to be smooth and in complete contact are, in fact, microscopically rough. The models should show the bumps and dips on the surfaces and how the surfaces only touch on a small number of the bumps. L2 IS
Kinesthetic

Figure 12 Forces can be balanced and unbalanced.

$$\begin{array}{c} \longrightarrow + \longleftarrow = 0 \\ \text{Net Force} = 0 \end{array}$$

A These students are pushing on the box with an equal force but in opposite directions. Because the forces are balanced, the box does not move.

$$\begin{array}{c} \longrightarrow + \longleftarrow = \longrightarrow \\ \text{Net Force} = \longrightarrow \end{array}$$

B These students are pushing on the box with unequal forces in opposite directions. The box will be moved in the direction of the larger force.

$$\begin{array}{c} \longrightarrow + \longrightarrow = \longrightarrow \\ \text{Net Force} = \longrightarrow \end{array}$$

C These students are pushing on the box in the same direction. The combined forces will cause the box to move.

Science Online

Topic: Forces and Fault Lines

Visit fl.gpscience.com for Web links to information about the unbalanced forces that occur along Earth's fault lines.

Activity Use inexpensive materials such as bars of soap to model the forces and movements along the fault lines. Share your models and demonstrations with your class.

Balanced Forces Force does not always change velocity. In **Figure 12A**, two students are pushing on opposite sides of a box. Both students are pushing with an equal force but in opposite directions. When two or more forces act on an object at the same time, the forces combine to form the **net force**. The net force on the box in **Figure 12A** is zero because the two forces cancel each other. Forces on an object that are equal in size and opposite in direction are called **balanced forces**.

Unbalanced Forces Another example of how forces combine is shown in **Figure 12B**. When two students are pushing with unequal forces in opposite directions, a net force occurs in the direction of the larger force. When forces combine to produce a net force that is not zero, the forces acting on the object are **unbalanced forces**. The net force that causes the box to accelerate will be the difference between the two forces because they are in opposite directions.

In **Figure 12C**, the students are pushing on the box in the same direction. These forces are combined, or added together, because they are exerted on the box in the same direction. The net force that acts on this box is found by adding the two forces together.

✓ Reading Check Give another example of an unbalanced force.

Visual Learning

Figure 12 Tell students that the net force acting on an object is called the resultant force. In **Figure 12A**, the forces are equal and in opposite directions, so the resultant force is zero. In **Figure 12B**, you can calculate the resultant force by subtracting the smaller force from the larger one. How would you calculate the resultant force in **Figure 12C**? **Add the two forces together.** L2 IS **Visual-Spatial**

Teacher FYI

Plate Tectonics Scientists do not fully understand the driving force behind the movement of the plates. There appear to be three factors contributing to the movement of the plates: the pull of gravity, convection currents in the mantle, and thermal plumes or vertical columns of molten material in the mantle.

Unbalanced Forces Change Velocity When the forces acting on an object are balanced, the velocity of an object doesn't change. If you and a friend push on a door from opposite sides with the same size force, the door doesn't move. The net force is zero and the forces are balanced. But if you push harder, the door moves in the direction of your push. The velocity the door, or any object, changes only when the forces on it are unbalanced.

Friction

Suppose you give a skateboard a push with your hand. The skateboard speeds up as you push it and then keeps moving after it leaves your hand. What happens to the skateboard's speed if it is moving on a flat, level surface? You know the answer. The skateboard slows down and finally stops.

After it left your hand, the skateboard's velocity changed because the forces acting on it were unbalanced. The unbalanced force that slowed the skateboard was friction. **Friction** is the force that opposes the sliding motion of two surfaces that are in contact.

What causes friction? The size of the frictional force exerted by one surface on another depends on the materials the surfaces are made from and the roughness of the surfaces. All surfaces have bumps and dips, including highly-polished metal surfaces that seem very smooth. When two surfaces are in contact, sticking occurs where the bumps and dips touch each other. This causes microwelds to form between the two surface. These microwelds tend to make the surfaces stick together and cause friction to occur.

The frictional force between two surfaces increases when the force pushing the surfaces together increases, as shown in **Figure 13**. When the surfaces are pushed together with more force, more of the bumps and dips come into contact. This increases the strength of the microwelds.

Figure 13 Friction is due to the microwelds that form between two surfaces in contact. These microwelds become stronger when the force pushing the surfaces together increases.

Explain how the area of contact between the surfaces changes when they are pushed together with a larger force.

SECTION 3 Motion and Forces 83

Mini LAB

Comparing Friction

Procedure

1. Place an ice cube, a rock, an eraser, a wood block, and a square of aluminum foil at one end of a metal or plastic tray.
2. Slowly lift the end of the tray with the items.
3. Have a partner use a metric ruler to measure the height of the raised end of the tray at which each object begins to slide. Record your measurements.

Analysis

1. List the height at which each object began to slide.
2. How did the height at which objects began to slide depend on the roughness of the objects?
3. How did the forces due to static and sliding friction compare for each object?

Mini LAB

Purpose Students observe the effect of friction on several materials. **L2 K Kinesthetic**

Materials ice cube, rock, eraser, wood block, square of aluminum foil, metal or plastic tray, metric ruler

Teaching Strategy Have an empty jar or beaker available for the ice cubes.

Analysis

1. The ice cube should slide first, followed by the aluminum foil, rock, wood block, and eraser.
2. The rougher the object, the higher it was before it began to slide.
3. Static friction was greater than sliding friction for all materials.

Assessment

Oral Ask students to list several ways to increase the friction between tires and ice. Put chains on tires, make tires with steel grips, add sand or some other abrasive to ice, add weight to the car. Use **Performance Assessment in the Science Classroom**, p. 93.

Caption Answer

Figure 13 The area of contact increases.

LAB DEMONSTRATION

Purpose to observe properties of friction

Materials 2 heavy wood blocks (about 10 cm × 15 cm × 5 cm thick), 2 nails, spring scale, string, strip of sandpaper as wide as the blocks, smooth surface

Procedure Pound nails in the center of one 5-cm side and one 15-cm side of one wood

block. Attach the spring scale and pull the block across a smooth surface. Record the force. Repeat on a rough surface with the second block on top. Repeat with the block on its end.

Expected Outcome There is more friction on a rough surface. Friction doubles if the

mass doubles. The area of contact doesn't affect friction.

Assessment

What would happen if a third block were placed on top of the second block? The frictional force would triple.

IDENTIFYING

Misconceptions

Effect of Surface Area on Friction

Friction is nearly independent of the surface area of contact. Friction depends on the microscopic contact areas on the microscopic welds that form when the surfaces are pushed together. If the microscopic contact area increases, more welds are formed. However, because pressure equals force divided by area, the pressure pushing the surfaces together decreases. This causes the contact area on each weld to become smaller so that the total microscopic contact area remains nearly unchanged.

Caption Answer

Figure 14 The net force is zero.

Using Science Words

Word Origin Have students find the origin of the word *friction*. The word *friction* comes from the Latin word *fricare*, which means “to rub.”

L2 **IS** Linguistic

Reading Strategy

Discussion Groups Organize students into groups of four. Assign a discussion leader and recorder. Have them use the following prompt to begin a discussion: What is friction? Have the recorder write a summary statement that outlines the main points of the conversation.

Reading Check

Answer opposite the direction of motion

Figure 14 The static friction force balances the applied force so the box doesn't move.

Infer the net force on the box.

Static Friction Suppose you push on a heavy box, like the one in **Figure 14**, and it doesn't budge. The velocity of the box didn't change, so another force is acting on the box that balances your push. This force is a frictional force called static friction that is due to the microwelds that have formed between the box and the floor. **Static friction** is the frictional force that prevents two surfaces in contact from sliding past each other. In this case, the box didn't move because your push is not large enough to break the microwelds between the two surfaces.

Sliding Friction You and a friend push together on the box and the box slides along the floor, as shown in **Figure 15**. As the box slides on the floor, another frictional force—sliding friction—opposes the motion of the box. **Sliding friction** is the force that acts in the opposite direction to the motion of a surface sliding on another surface. If you stop pushing, sliding friction causes the box to slow down and stop. The force due to sliding friction between two surfaces is smaller than the force due to static friction.

✓ Reading Check Sliding friction always is in what direction?

Rolling Friction When an object rolls over a surface, a frictional force due to rolling friction slows the object down. Rolling friction usually is much less than sliding friction. This is why it is easier to move a heavy object if it is on wheels.

Figure 15 Sliding friction acts on the sliding box in the direction opposite to the motion of the box.

84 CHAPTER 3 Motion, Acceleration, and Forces

Differentiated Instruction

Challenge In general, the smoother two surfaces are, the less friction there is between them. However, if surfaces are extremely smooth, they actually have more friction between them. Have students rub two new glass slides together and compare this to the resistance felt when rubbing older, scratched slides together. Ask them to explain this effect. **Extremely smooth surfaces have a greater true contact area (more humps are in contact).** **L3** **IS** Kinesthetic

Air Resistance

When an object falls toward Earth, it is pulled downward by the force due to gravity. However, a type of frictional force called **air resistance** opposes the motion of objects that move through the air. Air resistance causes objects to fall with different accelerations and different speeds. If there were no air resistance, then all objects, like the apple and feather shown in **Figure 16**, would fall with the same acceleration.

Air resistance acts in the direction opposite to the velocity of an object moving in air. If an object is falling downward, air resistance acts upward on the object. The size of the air resistance force depends on the size and shape of an object. Imagine dropping two identical plastic bags. One is crumpled into a ball and the other is spread out. When the bags are dropped, the crumpled bag falls faster than the spread-out bag. The downward force of gravity on both bags is the same, but the upward force of air resistance on the crumpled bag is less. As a result, the net downward force on the crumpled bag is greater, as shown in **Figure 17**.

The amount of air resistance on an object depends on the speed, size, and shape of the object. Air resistance, not the object's mass, is why feathers, leaves, and sheets of paper fall more slowly than pennies, acorns, and apples.

Figure 17 Because the bag on the left has a greater surface area, the bag on the left has more air resistance acting on it as it falls.

Figure 16 This photograph shows an apple and a feather falling in a vacuum. The photograph was taken with a strobe light that flashes on and off at a steady rate. Because there is no air resistance in a vacuum, the feather and the apple fall with the same acceleration.

SECTION 3 Motion and Forces 85

Activity

Air Resistance Have students show how air resistance affects the way an object falls by making a parachute out of string and cloth and attaching it to a small object. Suggest that students compare the rates at which the object falls when it is attached to the parachute and when it is not.

L1 ELL IS Kinesthetic

Inquiry Lab

Controlling Motion

Purpose To design a device that will control the motion of a marble and keep it in motion for exactly 3 min

Possible Materials Students will choose their own materials. Suggestions: cardboard sheets, cardboard tubes, pizza delivery boxes, plastic tubing

Estimated Time 2 class periods; outside class time may be required.

Teaching Strategies

- Divide the class into small groups. Students can use a variety of schemes to keep their marble in motion. The goal is to keep the marble in motion exactly 3 min, so the students will have to fine-tune their device. Encourage students to use gravity, springs, catapults, mouse traps, etc. to make their device fun.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Post Reading

Graphic Organizer Using the terms *balanced and unbalanced forces, friction, and air resistance* as central themes, have students develop a concept map with branches to words or ideas that provide details and explanations. Allow students to use illustrations to augment their chart.

Active Reading

ReQuest Have students listen carefully as you read an interesting story or newsworthy item aloud. After the reading, students, alone or in groups, can formulate questions to discuss. Have students participate in a ReQuest related to friction, air resistance, or terminal velocity.

Science Journal

Falling Objects Have students describe in their Science Journals how the velocity and acceleration of an object change as it falls from a tall building. *Initially, velocity increases causing the air resistance force to increase until it equals the force of gravity. The velocity is then constant and acceleration is zero until the object hits the ground.* **L2 IS Logical-Mathematical**

Discussion

Terminal Velocity What happens to an object's velocity and acceleration when the object reaches terminal velocity? *The object's velocity remains constant, so its acceleration is zero.*

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Have (or draw on the board) three boxes that are the same size but have different masses. Ask how the students could tell which is heaviest without actually picking it up. *You could push it along the floor. If the boxes are made from the same material so that the frictional force varies only with the weight of the box, the most difficult to push is the heaviest.*

Reteach

Friction Have students demonstrate how rolling friction is less than sliding friction by pulling a rubber band attached to a toy car. If the car is pulled on its wheels, the rubber band barely extends. If the car is pulled on its top, the rubber band extends much more.

L2 ELL KS Kinesthetic

✓ Assessment

Oral Have students work in small groups to discuss various sports they enjoy. They should explain how static, sliding, and rolling friction are important for the sport. Use PASC, p. 89.

Figure 18 When the sky diver reaches terminal velocity, the force due to air resistance balances the force due to gravity.

Terminal Velocity As an object falls, the downward force of gravity causes the object to accelerate. For example, after falling 2,000 m, without the effects of air resistance a skydiver's speed would be almost 200 m/s, or more than 700 km/h.

However, as the speed of a falling object increases, the upward force of air resistance also increases. This causes the net force on a sky diver to decrease as the sky diver falls. Finally, the upward air resistance force becomes large enough to balance the downward force of gravity. The net force on the object is zero, and the velocity of the object doesn't change. The object falls with a constant velocity called the terminal velocity. The terminal velocity is the highest velocity the falling object will reach.

The terminal velocity depends on the size, shape, and mass of the falling object. The air resistance force on an open parachute, like the one in **Figure 18**, is much larger than the air resistance on the a sky diver with a closed parachute. With the parachute open, the terminal velocity of the sky diver becomes small enough that the sky diver can land safely.

section 3 review

Summary

Balanced and Unbalanced Forces

- A force is a push or a pull that one object exerts on another object.
- The net force on an object is the combination of all the forces acting on the object.
- When the net force on an object is zero, the forces acting on the object are balanced.
- When the net force on an object is not zero, the forces acting on the object are unbalanced.
- Unbalanced forces cause the velocity of an object to change.

Friction

- Friction is the force that opposes motion between two surfaces that are touching each other.
- Friction depends on the types of surfaces and the force pressing the surfaces together.
- Static friction prevents surfaces that are in contact from sliding past each other.

Air Resistance

- Air resistance is a force that acts on objects that move through the air.

Self Check

1. **Explain** why the frictional force between two surfaces increases when the force pushing the surfaces together increases.
2. **Compare** the force of air resistance and the force of gravity on an object falling at its terminal velocity.
3. **Compare** the size of forces due to static, sliding, and rolling friction between two surfaces.
4. **Think Critically** What is the net force on a car stopped at a stop sign? What is the net force on a car moving in a straight line with a constant speed?

Applying Math

5. **Calculate Net Force** Two students push on a box in the same direction, and another pushes on the box in the opposite direction. What is the net force on the box if each pushes with a force of 50 N?
6. **Calculate Sliding Friction** You push a box with a force of 80 N. If the net force on the box is 50 N, what is the force on the box due to sliding friction?
7. **Calculate Acceleration** The downward force of gravity and the upward force of air resistance on a falling ball are both 5 N. What is the ball's acceleration?

section 3 review

1. The contact area between the surfaces increases and more microwelds are formed.
2. The two forces are equal and in opposite directions.
3. Static is greater than sliding which is greater than rolling.
4. The net force is 0 N in both cases.
5. 50 N in the direction the two students are pushing.
6. 30 N in the opposite direction of the 80 N force.
7. 0 m/s^2 (Net force is 0 N.)

FORCE AND ACCELERATION

If you stand at a stoplight, you will see cars stopping for red lights and then taking off when the light turns green. What makes the cars slow down? What makes them speed up? How do balanced and unbalanced forces affect the acceleration of objects?

Real-World Problem

How does an unbalanced force affect the motion of an object?

Goals

- Observe** how changing the net force on an object affects its acceleration.
- Interpret** data collected for several trials.

Materials

- | | |
|-------------------|------------------------------|
| tape | this science book |
| paper clip | triple-beam balance |
| 10-N spring scale | * <i>electronic balance</i> |
| large book | * <i>Alternate materials</i> |

Safety Precautions

Proper eye protection should be worn at all times while performing this lab.

Procedure

- Tie the string around the book and attach the paper clip to the string.
- Prepare a data table with the following headings: *Force, Mass*.
- If available, use a large balance to find the mass of the two books.
- Place the book on the floor or on the surface of a long table. Use the paper clip to hook the spring scale to the book.

- Pull the book across the floor or table at a slow but constant velocity. While pulling, read the force measured by the spring scale and record it in your data table.
- Repeat step 5 two more times, once accelerating slowly and once accelerating quickly. Be careful not to pull too hard. Your spring scale will read only up to 10 N.
- Place a second book on top of the first book and repeat steps 3 through 6.

Conclude and Apply

- Organize** the pulling forces from greatest to least for each set of trials. What is the relationship between the net force and the acceleration of the book?
- Explain** how adding the second book changed your results.

Communicating Your Data

Compare your conclusions with those of other students in your class.

LAB 87

Communicating Your Data

Have students discuss with one another any differences in their results and possible reasons for the differences.

BENCH TESTED

Video Lab available for this Lab.

Real-World Problem

Purpose Students will observe the relationship between mass, force, and acceleration. [L2]

Process Skills observe, compare, infer

Time Required 40 minutes

Procedure

Safety Precautions Students should wear safety goggles while this activity is in progress.

Teaching Strategy Remind students that the spring scale only reads up to 10 N, so they must not pull too hard.

Conclude and Apply

- As force increased, so did the acceleration.
- When the second book was added, the force should have increased. If the second book has approximately the same mass as the first book, the force should have doubled.

Assessment

Process Ask students to infer how the pulling force would change if a book with less mass were pulled. *Less force would be required.* How would it be different if three of the science books were pulled? *More force would be required.* Use **Performance Assessment in the Science Classroom**, p. 89. [L2]

Real-World Problem

Purpose Demonstrate how the motion of a toy car is affected by different forces. **L2** **IS**
Kinesthetic

Process Skills form a hypothesis, design an experiment, separate and control variables, interpret data, measure, use numbers, observe, infer, compare and contrast, recognize cause and effect, communicate, make and use tables, make and use graphs

Time Required 30 minutes to plan the experiment and 45 minutes to make measurements and graph data

Possible Materials Try small springs from molecular model sets to propel the cars by flipping one end of the spring against the car while holding the other end securely.

Use thin springs with loose windings so that they can be easily retracted and released to push the car forward. The string can be used to sharply tug the car. Rubber bands can be used, but they will provide less momentum.

Data Table:

Force Used	Distance	Time	Speed
1			
2			
3			
4			

Form a Hypothesis

Possible Hypothesis Students might hypothesize that the force of the spring will cause the car to go fastest.

Comparing Motion from Different Forces

Real-World Problem

Think about a small ball. How many ways could you exert a force on the ball to make it move? You could throw it, kick it, roll it down a ramp, blow it with a large fan, etc. Do you think the distance and speed of the ball's motion will be the same for all of these forces? Do you think the acceleration of the ball would be the same for all of these types of forces?

Form a Hypothesis

Based on your reading and observations, state a hypothesis about how a force can be applied that will cause a toy car to go fastest.

Test Your Hypothesis

Make a Plan

1. As a group, agree upon the hypothesis and decide how you will test it. Identify which results will confirm the hypothesis that you have written.
2. **List** the steps you will need to test your hypothesis. Be sure to include a control run. Be specific. Describe exactly what you will do in each step. List your materials.
3. **Prepare** a data table in your Science Journal to record your observations.

Goals

- **Identify** several forces that you can use to propel a small toy car across the floor.
- **Demonstrate** the motion of the toy car using each of the forces.
- **Graph** the position versus time for each force.
- **Compare** the motion of the toy car resulting from each force.

Possible Materials

small toy car
ramps or boards
of different lengths
springs or rubber bands
string
stopwatch
meterstick or tape measure
graph paper

Safety Precautions

Alternative Inquiry Lab

Real-World Connection To make the lab an inquiry lab, give the students more personal investment into the problem by connecting it to the real world. Tell the students that they are designing a race track for a new type of car racing. They are to design a

new race track that will allow stock cars to break speed records in racing. Students should consider safe but innovative ways to increase the speeds of the race cars. **L2**

Using Scientific Methods

4. **Read** the entire experiment to make sure all steps are in logical order and will lead to a useful conclusion.
5. **Identify** all constants, variables, and controls of the experiment. Keep in mind that you will need to have measurements at multiple points. These points are needed to graph your results. You should make sure to have several data points taken after you stop applying the force and before the car starts to slow down. It might be useful to have several students taking measurements, making each responsible for one or two points.

Follow Your Plan

1. Make sure your teacher approves your plan before you start.
2. Carry out the experiment as planned.
3. While doing the experiment, record your observations and complete the data tables in your Science Journal.

Analyze Your Data

1. **Graph** the position of the car versus time for each of the forces you applied. How can you use the graphs to compare the speeds of the toy car?
2. **Calculate** the speed of the toy car over the same time interval for each of the forces that you applied. How do the speeds compare?

Conclude and Apply

1. **Evaluate** Did the speed of the toy car vary depending upon the force applied to it?
2. **Determine** For any particular force, did the speed of the toy car change over time? If so, how did the speed change? Describe how you can use your graphs to answer these questions.
3. **Draw Conclusions** Did your results support your hypothesis? Why or why not?

Communicating Your Data

Compare your data with those of other students. **Discuss** how the forces you applied might be different from those others applied and how that affected your results.

LAB 89

Assessment

Process Ask students to draw diagrams showing how fiction, gravity, and inertia influenced the motion of the car. Use **Performance Assessment in the Science Classroom**, p. 127. L2

Communicating Your Data

Have students use graphics software to prepare a poster explaining their experiment and the results. Posters should contain sketches showing forces on the car. They might also include graphs of the data. L2

Test Your Hypothesis

Possible Procedures Position students with stopwatches at points along a track to determine when the car reaches that point. One student will provide the initial force to the car by releasing a spring against it, tugging it with a string, etc.

Teaching Strategy Encourage students to provide a sufficient force to enable the car to travel the entire length of the track they have made.

Expected Outcome Although results will vary greatly, students should be able to determine the average speed of the car for each force.

Analyze Your Data

1. Some graphs will show a slight increase in speed. Others will show a decrease in speed.
2. Students should calculate the average speed using $v = d/t$.

Error Analysis Ask students to compare their results with other groups and discuss ways the differences could be minimized.

Conclude and Apply

1. yes
2. Answers will vary.
3. Answers will depend on student hypotheses.

Understanding Literature

Descriptive Writing Angelou is telling us that the power that people have to make changes for better lives is more significant than the universe and the special places people have built on Earth.

Respond to the Reading

1. small, lonely, miniscule, kithless, wayward, floating
2. people
3. **Linking Science and Writing** Remind students that the Moon revolves around Earth. Therefore, their poems should describe how the Moon might see the Sun come and go as it moves around Earth.

INTEGRATE **Motion** In the Middle Ages, most people thought Earth stood still and that the sky moved around Earth. It is now known that the daily movement of the stars is due to Earth's rotation on its axis. At the same time that Earth rotates, it revolves about the Sun. Earth follows the Sun in its wanderings through the heavens. The Sun revolves around the center of the Milky Way. Earth, a satellite of the Sun, takes part in this journey.

"A Brave and Startling Truth"

by Maya Angelou

We, this people, on a small and lonely planet
Traveling through casual space
Past aloof stars, across the way of indifferent suns
To a destination where all signs tell us
It is possible and imperative that we learn
A brave and startling truth ...

When we come to it
Then we will confess that not the Pyramids
With their stones set in mysterious perfection ...
Not the Grand Canyon
Kindled into delicious color
By Western sunsets
These are not the only wonders of the world ...

When we come to it
We, this people, on this minuscule and kithless¹
globe ...
We this people on this mote² of matter

When we come to it
We, this people, on this wayward³, floating body
Created on this earth, of this earth
Have the power to fashion for this earth
A climate where every man and every woman
Can live freely without sanctimonious piety⁴

Without crippling fear

When we come to it
We must confess that we
are the possible
We are the miraculous, the
true wonder of the world
That is when, and only
when
We come to it.

Understanding Literature

Descriptive Writing The poet names some special places on Earth. These places, although marvelous, fall short of being really wonderful. How does Angelou contrast Earth's position within the universe to emphasize the importance of people?

Respond to the Reading

1. What adjectives does the poet use to describe Earth?
2. What does the poet believe are the true wonders of the world?
3. **Linking Science and Writing** Write a six-line poem that describes Earth's movement from the point of view of the Moon.

INTEGRATE Sometimes a person doesn't need to see movement to know that something has moved. Even though we don't necessarily see Earth's movement, we know Earth moves relative to a reference point such as the Sun. If the Sun is the reference point, Earth moves because the Sun appears to change its position in the sky. The poem describes Earth's movement from a reference point outside of Earth, somewhere in space.

- 1 to be without friends or neighbors
- 2 small particle
- 3 wanting one's own way in spite of the advice or wishes of another
- 4 a self-important show of being religious

"On the Pulse of Morning" from *The Complete Collected Poems of Maya Angelou*, Maya Angelou, Random House, Inc., 1994

Space Travel, edited by Ben Bova with Anthony R. Lewis, Writer's Digest Books, 1997

Roller Coaster, by David Bennett, Chartwell Books, 1998

Reviewing Main Ideas

Section 1 Describing Motion

1. Motion is a change of position of a body. Distance is the measure of how far an object moved. Displacement is the distance and direction of an object's change in position from the starting point.

2. A reference point must be specified in order to determine an object's position.
3. The average speed of an object can be calculated from this equation:

$$\bar{v} = \frac{d}{t}$$

4. Velocity is a vector that includes the speed and direction of a moving object.
5. The slope of a line on a distance-time graph is equal to the speed.

Section 2 Acceleration

1. Acceleration occurs when an object changes speed or changes direction.
2. An object speeds up if its acceleration is in the direction of its motion.

3. An object slows down if its acceleration is opposite to the direction of its motion.
4. Acceleration is the rate of change of velocity, and is calculated from this equation:

$$\bar{a} = \frac{v_f - v_i}{(t_f - t_i)}$$

Section 3 Motion and Forces

1. A force is a push or a pull.
2. The net force acting on an object is the combination of all the forces acting on the object.
3. The forces on an object are balanced if the net force is zero.
4. Sliding friction is a force opposing the sliding motion of two surfaces in contact. Static friction prevents surfaces in contact from sliding past each other.
5. Air resistance opposes the motion of objects that move in the air.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review motion.

CHAPTER STUDY GUIDE 91

Identifying Misconceptions

After students have done the activity on page F and completed the chapter, perform this activity.

Materials protractor, paper, ruler, string

Procedure Have each student use the protractor to draw a large circle and label four points 90 degrees apart A, B, C and D. Have them

place an object at point A. Their mission is to find the object's distance traveled and displacement at points B, C and D as it travels around the circle.

Expected Outcome Use the string to measure the circle or use the formula $c = 2 \pi r$. [L2]

Assess

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment

Assessment Transparency Motion and Speed

Directions: Carefully review the diagrams and answer the following questions

1. Some students planned four games of tug-of-war and tried to predict the outcome of each game. What factor would be important for the students to know in order to make an accurate prediction of the outcome?
A the type of ground surface
B the number of people on each team
C the average height of each person
D the mass of the rope
2. If all other factors are equal, which picture shows two teams that are the most equal?
F 1 G 2 H 3 J 4
3. If all other factors are equal, which picture shows two teams that are the least equal?
A 1 B 2 C 3 D 4

[L2]

FOLDABLES Have students use their Foldables to review the content of the chapter. On the back, have them write five facts they have learned about motion.

Using Vocabulary

- Both tell how distance changes with time. Velocity includes the direction.
- Displacement is distance and direction from a starting point. Distance is the length of the path followed by the object.
- Both describe rate of change in position. Average speed refers to total distance traveled divided by total time elapsed. Instantaneous speed refers to speed at a given point in time.
- Balanced forces are forces on an object that cancel each other out. Net force is the sum of all forces acting on an object.
- Velocity is the speed and direction of an object. Acceleration is how the velocity changes with time.
- Velocity is the speed and direction of an object. Instantaneous speed is how fast an object moves at a given point in time.
- Both are forces that oppose the motion of surfaces that are touching each other. Static friction is the force between two surfaces that are not moving relative to one another. Sliding friction is the force opposing the motion of one surface as it slides over another surface.
- Both are forces that tend to oppose motion. Friction is between surfaces. Air resistance is the force acting to oppose the motion of an object as it moves through air.

FCAT Vocabulary

Compare and contrast the following pairs of vocabulary words.

- speed—velocity
- distance—displacement
- average speed—instantaneous speed
- balanced force—net force
- acceleration—velocity
- velocity—instantaneous speed
- static friction—sliding friction
- friction—air resistance

Checking Concepts

Choose the word or phrase that best answers the question.

- Which of the following do you calculate when you divide the total distance traveled by the total travel time?
A) average speed
B) constant speed
C) variable speed
D) instantaneous speed
- Which term below best describes the forces on an object with a net force of zero?
A) inertia
B) balanced forces
C) acceleration
D) unbalanced forces

- Which of the following is a proper unit of acceleration?
A) s/km^2
B) km/h
C) m/s^2
D) cm/s
- Which of the following is not used in calculating acceleration?
A) initial velocity
B) average speed
C) time interval
D) final velocity
- In which of the following conditions does the car NOT accelerate?
A) A car moves at 80 km/h on a flat, straight highway.
B) The car slows from 80 km/h to 35 km/h.
C) The car turns a corner.
D) The car speeds up from 35 km/h to 80 km/h.
- What is the slope of a line on a distance-time graph?
A) displacement
B) force
C) speed
D) acceleration
- How can speed be defined?
A) acceleration/time
B) change in velocity/time
C) distance/time
D) displacement/time

Interpreting Graphics

Use the table below to answer question 16.

Distance-Time for Runners

Time (s)	1	2	3	4
Sally's distance (m)	2	4	6	8
Alonzo's distance (m)	1	2	2	4

- Graph the motion of both runners on a distance-time graph. What is the average speed of each runner? Which runner stops briefly? Over what time interval do they both have the same speed?

17. Copy and complete this concept map on motion.

Thinking Critically

18. **Evaluate** Which of the following represents the greatest speed: 20 m/s, 200 cm/s, or 0.2 km/s?
19. **Describe** a line on a distance-time graph representing an object that is not moving.
20. **Infer** You push a book on a table so that its velocity is constant. If the force you apply is 15 N, what is the force due to sliding friction?
21. **Determine** If you walked 20 m, took a book from a library table, turned around and walked back to your seat, what are the distance traveled and displacement?

22. **Explain** When you are describing the rate that a race car goes around a track, should you use the term *speed* or *velocity* to describe the motion?

Applying Math

23. **Calculate Speed** A cyclist must travel 800 km. How many days will the trip take if the cyclist travels 8 h/day at an average speed of 16 km/h?
24. **Calculate Acceleration** A satellite's speed is 10,000 m/s. After 1 min, it is 5,000 m/s. What is the satellite's acceleration?
25. **Calculate Displacement** A cyclist leaves home and rides due east for a distance of 45 km. She returns home on the same bike path. If the entire trip takes 4 h, what is her average speed? What is her displacement?
26. **Calculate Velocity** The return trip of the cyclist in question 13 took 30 min longer than her trip east, although her total time was still 4 h. What was her velocity in each direction?

Use the graph below to answer question 27.

27. **Interpret a Graph** Use the graph to determine which runner had the greatest speed.

Interpreting Graphics

16. Sally's average speed is 2 m/s and Alonzo's is 1 m/s. Alonzo stops briefly; they run at the same speed from 3 s to 4 s.

17. See student page.

Thinking Critically

18. 0.2 km/s
19. The line would be horizontal.
20. 15 N
21. distance traveled, 40 m; displacement, 0 m
22. Speed, because the velocity is constantly changing due to the constant change of direction.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2, MA.E.1.4.1

23. $\text{time} = 800 \text{ km} / 16 \text{ km/h} = 50 \text{ h}$;
at 8 h/day, total time is 6 days 2 hours
24. about -83.3 m/s^2
25. 22.5 km/h; displacement is 0 km
26. Time there is 1.75 hours; time back is 2.25 hours; velocity there is 25.7 km/h; velocity back is 20 km/h.
27. Runner 1 because of the greater slope on the graph.

Multiple Choice

1. B
2. C
3. C
4. B
5. A
6. C
7. B
8. C

Record your answers on the answer sheet provided by your teacher or on a sheet of paper. The assessed Florida Benchmark appears above the question.

Multiple Choice

1. Sound travels at a speed of 330 m/s. How long does it take for the sound of thunder to travel 1,485 m?
 - A. 45 s
 - B. 4.5 s
 - C. 4,900 s
 - D. 0.22 s

Use the graph below to answer questions 2–4.

Change in Speed over Time

2. The graph shows how a cyclist's speed changed over 0.5 h. What is the cyclist's average speed if the trip was 6 km?
 - A. 3 km/h
 - B. 10 km/h
 - C. 12 km/h
 - D. 20 km/h

Test-Taking Tip

Read Carefully Read each question carefully for full understanding.

3. Once the trip was started, how many times did the cyclist stop?
 - A. 0
 - B. 4
 - C. 2
 - D. 5
4. What was the fastest speed the cyclist traveled?
 - A. 20 km/h
 - B. 30 km/h
 - C. 12 km/h
 - D. 10 km/h

Use the table below to answer questions 5 and 6.

Runner	Distance covered (km)	Time (min)
Daisy	12.5	42
Jane	7.8	38
Bill	10.5	32
Joe	8.9	30

5. What is Daisy's average speed?
 - A. 0.30 km/min
 - B. 530 km/min
 - C. 3.0 km/min
 - D. 3.4 km/min
6. Which runner has the fastest average speed?
 - A. Daisy
 - B. Jane
 - C. Bill
 - D. Joe

SC.C.1.4.2

7. A skier is going down a hill at a speed of 9 m/s. The hill gets steeper and her speed increases to 18 m/s in 3 s. What is her acceleration?

A. 9 m/s²
B. 3 m/s²
C. 27 m/s²
D. 6 m/s²

SC.C.1.4.2

8. Which of the following best describes an object with constant velocity?

A. It is changing direction.
B. Its acceleration is increasing.
C. Its acceleration is zero.
D. Its acceleration is negative.

Gridded Response

SC.C.1.4.2

9. If a car is traveling at a speed of 40 km/h and then comes to a stop in 5 s, what is its acceleration in m/s²?

Short Response

Use the table below to answer question 10.

Car	Mass (kg)	Stopping Distance(m)
A	1,000	80
B	1,250	100
C	1,500	120
D	2,000	160

10. What is the relationship between a car's mass and its stopping distance?

SC.C.1.4.2

11. If the speedometer on a car indicates a constant speed, can you be sure the car is not accelerating? Explain.

READ
INQUIRE
EXPLAIN

Extended Response

Use the graph below to answer question 12.

Graphing Motion

12. The graph shows the motion of three swimmers during a 30-min workout. Describe the motion of the three swimmers.

SC.C.1.4.1

13. Where would you place the location of a reference point in order to describe the motion of a space probe traveling from Earth to Jupiter? Explain your choice.

Gridded Response

9. 2.2

Short Response

10. The greater the mass of the car, the greater the stopping distance.
11. No, because the car could be accelerating if it is changing direction.

Extended Response

12. Swimmer A swam at a constant rate of 40 m/min for 10 min., rested for 10 min., then swam at a constant rate of 80 m/min for 10 min. Swimmer B swam at a constant rate of 60m/min for 30 min. Swimmer C swam at a constant rate of 80m/min for 30 min.
13. Possible answer: at the Sun, because Earth and Jupiter move with respect to the Sun

Section Focus

Section Focus Transparency **Something He Could Sink His Teeth Into!**

In 1999, Krishna Gopal Shrivastava of India set an unverified world record by pulling a ship with a mass of 244,000 kg with his teeth! His shorts can teach us about force, mass, and acceleration.

1. What would happen if the man were pulling a small rowboat instead of a large ship?
2. When he stops pulling, will the ship stop moving? Explain.
3. What direction is the ship moving? Why?

L2

Section Focus Transparency **Which way's up?**

There is no up or down in orbit. If you floated in space, you'd float here and there. Planes like Skylab orbit the "down" center of Earth, so they simulate the conditions of being in orbit.

1. On Earth, how can you tell up from down?
2. If a scale floated by and an astronaut stood on it, what would the scale read?

L2

Section Focus Transparency **Fighting Fire**

It takes more than one firefighter to aim a hose. The force of the water shooting out of the nozzle causes a reaction that can be difficult to control.

1. Describe what happens if you step from a canoe or small boat into a large ship.
2. Does a garden hose need more than one person to hold it? What's the difference between a garden hose and a fire hose?
3. What would happen if the firefighters dropped the hose?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Assessment Transparency **The Laws of Motion**

Directions: Carefully review the table and answer the following questions.

Mass and Weight on Earth and the Moon				
Object	Mass on Earth	Weight on Earth	Mass on Moon	Weight on Moon
Astronaut	50 kg	490 N	50 kg	49 N
Flashlight	1 kg	9.8 N	1 kg	9.8 N
Lunar Rover	650 kg	6370 N	650 kg	637 N
Moon rocks	22 kg	215.6 N	22 kg	21.6 N

According to the information, which object has a weight on the Moon greater than 1000 newtons?

- Astronaut
- Flashlight
- Lunar Rover
- Moon rocks

2. Astronauts discovered how much easier it is to lift objects on the Moon. The weight of these objects on the Moon is due to

- Earth's gravity
- Earth's rotation
- the Moon's rotation
- the Moon's gravity

According to the table, which object weighs the LEAST?

- Astronaut
- Flashlight
- Lunar Rover
- Moon rocks

4. Based on the data in the table, about how many times greater is the weight of these objects on Earth than on the Moon?

- Two times
- Six times
- Four times
- Eight times

L2

Teaching

Teaching Transparency **Stationary and Falling Elevator**

L2

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.

ELL ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Hands-on Activities

Student Text Lab Worksheet

LAB Gravity and Air Resistance

Lab Purpose: Determine how air resistance affects falling objects.

Real-World Problem: How does air resistance affect the motion of objects?

Materials: Paper, ruler, stopwatch, string, tape.

Procedure: 1. Drop a piece of paper from a height of 1 meter. 2. Time how long it takes to reach the ground. 3. Repeat for a crumpled piece of paper.

Data and Observations: Table 1: Effects of Air Resistance. Columns: Object, Time to Fall, Notes.

Figure 1a: Diagram of a falling object.

L2

Laboratory Activities

LAB Projectile Motion

Lab Purpose: Determine the path of a projectile.

Strategy: Use a video camera to record the motion of a projectile.

Materials: Video camera, screen, ball, tape.

Figure 1a: Diagram of a projectile's path.

Figure 1b: Diagram of a projectile's path.

L2

Content Outline	Reinforcement	Enrichment
1. Identify the components of a system. 2. Describe the function of each component. 3. Explain the relationship between the components. 4. Identify the inputs and outputs of a system. 5. The First Two Laws of Motion

L1

What You'll Learn

- Understand Newton's first and second laws of motion
- Know constant and variable velocity
- Understand Newton's third law of motion

Why You Need to Read

Newton's laws of motion are the foundation of classical mechanics. They explain the motion of objects from the smallest particles to the largest galaxies in the universe.

➤ Create a Quiz

As you are studying the sections, write down key points to make a quiz for yourself. Use the quiz to test your knowledge of the material.

➤ Read to Learn

Newton's Laws of Motion

Newton's first law of motion, also known as the law of inertia, states that an object at rest will stay at rest, and an object in motion will stay in motion with the same velocity unless acted upon by an unbalanced force. This means that if you are sitting in a chair, you will stay sitting unless someone or something pushes or pulls you. Similarly, if a car is moving at a constant velocity, it will continue to move at that velocity unless a force acts on it to change its speed or direction.

Newton's second law of motion states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. This can be written as $F = ma$, where F is the net force, m is the mass, and a is the acceleration. This law explains why a heavier object requires more force to accelerate than a lighter object.

➤ Find More Ideas

Look for more ideas in the "Find More Ideas" section of the book. You will find many more ideas and examples of Newton's laws of motion.

The First Law of Motion

Newton's first law of motion, also known as the law of inertia, states that an object at rest will stay at rest, and an object in motion will stay in motion with the same velocity unless acted upon by an unbalanced force. This means that if you are sitting in a chair, you will stay sitting unless someone or something pushes or pulls you. Similarly, if a car is moving at a constant velocity, it will continue to move at that velocity unless a force acts on it to change its speed or direction.

4-2 CHAPTER 4 The Laws of Motion

Test Practice Workbook Chapter Review Chapter Tests

[illegible]

Chapter Review	The Words of Motion			
Part A Vocabulary Review				
Directions: Use the gloss of the word with the sense from the list that correctly completes each sentence.				
gravity	weight	displacement		
inertia	Newton's second law of motion	projectile		
centrifugal force	Newton's third law of motion	centrifugal acceleration		
Newton's first law of motion		conservation of momentum		
1. Gravity is a force that acts on objects and gives them motion.				
2. The wind lifted the sailboat and set it moving in a new direction.				
3. A ball that is thrown at a vertical angle will eventually come back down.				
4. When an object is moving in a circle, it is constantly changing direction.				
5. The force that causes an object to resist changes in its motion is called inertia.				
6. The force that acts on the spinning wheel of a ball is called _____.				
7. _____ is the force that causes an object to resist changes in its motion.				
8. _____ is the force that causes an object to resist changes in its motion.				
9. _____ is the force that causes an object to resist changes in its motion.				
10. _____ is the force that causes an object to resist changes in its motion.				
11. _____ is the force that causes an object to resist changes in its motion.				
12. _____ is the force that causes an object to resist changes in its motion.				
13. _____ is the force that causes an object to resist changes in its motion.				
14. _____ is the force that causes an object to resist changes in its motion.				
15. _____ is the force that causes an object to resist changes in its motion.				
16. _____ is the force that causes an object to resist changes in its motion.				
17. _____ is the force that causes an object to resist changes in its motion.				
18. _____ is the force that causes an object to resist changes in its motion.				
19. _____ is the force that causes an object to resist changes in its motion.				
20. _____ is the force that causes an object to resist changes in its motion.

Science Content Background

SECTION 1 The First Two Laws of Motion

Force, Mass, and Acceleration

Dynamics is the study of motion produced by forces. It comes from the Greek word *dynamis*, which means “strength or power.” Words such as *dynamite* and *dynamo* share these origins.

Newton's Second Law

It follows from this law that if an object is accelerating, there must be a force acting on it. Engines produce forces to make cars positively accelerate. The brakes produce forces to cause negative acceleration. A planet moving with constant speed around a star is constantly changing direction and therefore is accelerating toward the star. This acceleration is due to the force of gravity between the star and the planet.

A force of one newton is equal to one kilogram meter per second squared ($1 \text{ N} = 1 \text{ kg m/s}^2$). Thus, when dividing force by mass, the kg units cancel, leaving the acceleration units of m/s^2 .

SECTION 2 Gravity

The Law of Gravitation

Newton described the gravitational force between two objects and the distance between them with the follow-

ing equation: $\text{force of gravity} = G \times (\text{mass}_1) \times (\text{mass}_2) / (\text{distance between them})^2$. G is the universal gravitational constant. If the mass of one of the objects quadruples, the force of gravity quadruples. If the distance between the objects quadruples, the force of gravity is reduced by one-sixteenth.

Gravitational Acceleration

The average acceleration due to gravity on Earth is 9.8 m/s^2 . This value varies slightly with location. In general the greater the distance from Earth's center, the lower the value, which means gravitational acceleration is smaller on a mountain than in a valley. The acceleration at the equator tends to be less than at the poles. This is because Earth is not a perfect sphere; its poles are somewhat pushed together. The acceleration due to gravity on Mercury is 3.8 m/s^2 , while on Jupiter it is 22.9 m/s^2 .

Newton's second law can be used to explain why all objects, regardless of mass, fall with the same acceleration due to gravity. Objects with a large mass have a greater gravitational force acting on them. However, although the force is great, so is the mass. These offset each other, causing all objects to fall with the same acceleration.

Centripetal Force

An object in circular motion is sometimes said

to be experiencing centrifugal force, which really doesn't exist. If you swing a bucket of water on a string, the water seems to be pushed outward, but this is due to the water's inertia. If tends to move in a straight-line motion while the bucket is pulled in by the centripetal force of the string. This causes the water to remain at the bottom of the bucket.

section 2 The Third Law of Motion **Newton's Third Law**

The recoil of a rifle is an interesting application of Newton's laws. When fired, the rifle "kicks back" into the shoulder of the shooter. If the rifle hurts the shoulder, should the shooter use a more-massive or a less-massive gun? If the guns are firing the same bullets with the same accelerations, the more-massive gun will give less kickback. The recoil force will be the same, but the more-massive gun will not accelerate as much ($a = F/m$).

Finding Planets with Newton's Laws

Newton's third law is now being used to find planets in other solar systems. The planets are

not directly seen, but their presence is inferred from the behavior of the stars in that solar system. More than 50 planets in other solar systems have been found this way.

Momentum

To hit a homerun, a softball player must impart the maximum momentum from his or her body and the bat to the ball. To do this, each player must find the bat that gives him or her the best combination of mass and speed. A heavier bat has more mass but the player may not be able to swing it as fast as a lighter bat.

A force applied over time, also called an impulse, can change momentum. The momentum change depends on the size of the net force acting on an object and the time over which the net force acts. A large force acting for a short time and a small force acting for a longer time can cause equal changes in momentum. The formula describing this relationship is $F \times t = m \Delta v$. In softball, following through on a swing can increase the amount of time the bat stays in contact with the ball, and this causes a greater velocity gain by the ball.

Teacher to Teacher

Sarah Vandermeer
St. Charles High School
Columbus, OH

"I have one of the smaller and one of the larger students in the class each take a 100-N spring scale. We hook the two scales together, and each student pulls as hard as possible. A third student reads each of the scales and, sure enough, they have the same reading. This is true even if the stronger student causes the smaller one to slide along the floor. You can also get two bathroom scales and place them bottom to bottom between the students. When they push on the scales, against each other, the two scales show the same force."

Who's a dummy?

Crunch! This test dummy would have some explaining to do if this were a traffic accident. But in a test crash, the dummy plays an important role. The forces acting on it during a crash are measured and analyzed in order to learn how to make cars safer.

Science Journal Explain which would be a safer car—a car with a front that crumples in a crash, or one with a front that doesn't crumple.

96

Theme Connection

Stability and Change Newton established his three laws of motion by considering common patterns of change in all motion. Newton's laws can be used to analyze and predict changes in the motion of objects.

About the Photo

Crash Forces During a car crash, the forces exerted on the car's occupants can be enormous. The size of the force depends on the speed of the car, the stopping distance, and the mass of the occupant. If a car moving at 30 mph crashes, a 160-lb driver without a seat belt could experience a force equal to 150 times the force of gravity.

Start-Up Activities

The Force of Gravity

The force of Earth's gravity pulls all objects downward. However, objects such as rocks seem to fall faster than feathers or leaves. Do objects with more mass fall faster?

1. Measure the mass of a softball, a tennis ball, and a flat sheet of paper. Copy the data table below and record the masses.
2. Drop the softball from a height of 2.5 m and use a stopwatch to measure the time it takes for the softball to hit the floor. Record the time in your data table.
3. Repeat step 2 using the tennis ball and the flat sheet of paper. Record the times in your data table.
4. Crumple the flat sheet of paper into a ball, and measure the time for the crumpled paper to fall 2.5 m. Record the time in your data table.
5. **Think Critically** Write a paragraph comparing the times it took each item to fall 2.5 m. From your data, infer if the speed of a falling object depends on the object's mass.

Falling Object Data

Object	Mass	Time
Softball		
Tennis ball		
Flat paper		
Crumpled paper		

FOLDABLES[™] Study Organizer

The Laws of Motion Make the following Foldable to help you better understand Newton's laws of motion as you read the chapter.

- STEP 1** Fold the top of a vertical piece of paper down and the bottom up to divide the paper into thirds.

- STEP 2** Unfold and label the rows *First Law*, *Second Law*, *Third Law*.

Find Main Ideas As you read the chapter, list the main ideas in the sections on the laws of motion under the appropriate column.

Science online

Preview this chapter's content and activities at flapsciences.com

Purpose Use the Launch Lab to introduce students to the phenomenon that, neglecting air resistance, objects with different masses fall with the same acceleration. **L2** **Visual-Spatial**

Preparation Find a suitable location, such as a stairwell, from which students can drop the balls. Measure a distance of 2.5 m above the floor, and mark the height with a piece of tape.

Materials softball, meterstick, tennis ball, paper, stopwatch

Teaching Strategy Have students do this lab in pairs so one student can drop the balls while the other observes and determines which object hit the ground first.

Think Critically

Although they differ in mass, the softball, tennis ball, and crumpled paper ball will fall at nearly the same velocity. Air resistance prevents the flat paper from falling with the same velocity as the crumpled paper ball.

Assessment

Process Have students make bar graphs of the data they obtained in this activity. Use **Performance Assessment in the Science Classroom**, p. 111.

Tie to Prior Knowledge

Movement Ask students how they move heavy objects. In this section, they will learn how the mass of an object affects how easy it is to move and why some objects keep moving while others stop.

Set a Purpose Have students scan the text to find the new vocabulary words. Be sure they look carefully at figures and headings for clues to meaning. Using ideas gleaned from scanning, have students develop questions that incorporate the vocabulary terms. As students read the text, they should answer each other's questions.

Reading Guide

What You'll Learn

- **Define** Newton's first law of motion.
- **Explain** how inertia and mass are related.
- **Define** Newton's second law of motion.
- **Apply** Newton's second law of motion.

Why It's Important

Newton's first two laws of motion explain how forces cause the motion of objects to change.

New Vocabulary

- first law of motion
- inertia
- second law of motion

Review Vocabulary

net force: the combination of all forces acting on an object

Newton's Laws of Motion

When you lift a backpack, you exert a force on an object and cause it to move. The backpack initially was at rest. The force you exerted caused its velocity to change. But if you push downward on a table, the table doesn't move. The force you applied did not cause the velocity of the table to change. How are forces and motion related?

The British scientist Isaac Newton, who lived from 1642 to 1727, published a set of three rules in 1687 that explained how forces and motion are related. These three rules are called Newton's laws of motion. They apply to the motion of all objects you encounter every day, such as those in **Figure 1**, as well as to the motion of planets, stars, and galaxies.

Figure 1 Newton's laws of motion apply to all objects, including the volleyball and the volleyball players.

98 CHAPTER 4 The Laws of Motion

The First Law of Motion

Newton's first law of motion describes how an object moves when the net force acting on it is zero. According to Newton's **first law of motion**, if the net force acting on an object is zero, the object remains at rest, or if the object is moving, it continues moving in a straight line with constant speed. The first law of motion means that if the forces acting on an object are balanced, then the velocity of the object doesn't change.

Reading and Writing Skills Activities, p. 49

Only Unbalanced Forces Change Velocity The first law of motion connects forces with changes in motion. For example, suppose a skateboard is at rest. The skateboard doesn't move until you give it a push. Then the velocity of the skateboard increases while you are pushing it. The forces on the skateboard are unbalanced while you are pushing on it. As a result, the velocity of the skateboard changes as its speed increases.

However, after the skateboard leaves your hand, it slows down and stops. It might seem that the skateboard stops moving because there are no forces acting on it. However, there is an unbalanced frictional force that acts on the skateboard as it rolls. This is the force that causes the skateboard to stop. The unbalanced frictional force causes the velocity of the skateboard to change as its speed decreases. The velocity of an object changes only when there are unbalanced forces acting on it.

Inertia and Mass

All objects have a property called inertia. **Inertia** is the tendency of an object to resist a change in its motion. The dirt bike in **Figure 2** has inertia that tends to keep it moving with a constant velocity when its rider tries to steer around a curve. The inertia of an object depends on the object's mass. The greater the mass of an object, the greater its inertia.

For example, a bowling ball has more mass than a volleyball. Which would be harder to stop—a volleyball or a bowling ball rolling at the same speed? You would have to exert a greater force on the bowling ball to make it stop. The bowling ball has more inertia than the volleyball because it has more mass.

Reading Check How does the inertia of an object depend on the object's mass?

Figure 2 Inertia causes the bike to move in a straight line despite the efforts of the rider to steer the bike around the curve.

SECTION 1 The First Two Laws of Motion 99

Mini LAB

Observing Inertia

Procedure

1. Create an inclined plane using a board and textbooks.
2. Place a small object in a cart and let the cart roll down the plane. Record the results.
3. Secure the object in the cart with rubber bands. Let the cart roll down the plane and record your results.

Analysis

1. Identify the forces acting on the object in the cart in both runs.
2. Explain how safety belts reduce the risk of injury in a car crash.

2 Teach

Mini LAB

Purpose Students will observe the effect of inertia. **L2** **KS**

Kinesthetic

Materials board, textbooks, block, small object, cart, rubber bands

Teaching Strategy Be sure the students' ramps are not so steep they are unable to observe the motion of the object and cart as it comes to a sudden stop.

Analysis

1. Without rubber bands, the forces are gravity and the force exerted by the cart on the object. When the cart hits the wall, the object continues moving until the stop block exerts a force on it. The rubber bands exert an additional force on the object. Because the rubber bands can stretch, the object slows down over a longer period of time, reducing the stopping force.
2. In a crash, seat belts reduce the stopping force and decrease damage to passengers.

Assessment

Process Ask students to make diagrams of each run of the cart. Have them use labeled arrows to indicate the forces. Use PASC, p. 127.

Reading Check

Answer the greater the object's mass, the greater its inertia

Reading Strategy

Determine Importance After students read about inertia, ask them to come up with three points they think are particularly important in this section and explain why. Have partners compare their lists and then share with the class.

Visual Learning

Figure 2 Have students sketch the situation depicted in **Figure 2**, then add arrows to their drawings to indicate the forces acting on the bike. Have a student read the caption describing the picture and ask the students if their arrows are consistent with this explanation.

Teacher FYI

Although the law of inertia is called Newton's first law, Galileo formulated it before Newton was even born. In his writings, Newton credited Galileo for the idea.

Caption Answer

Figure 3 same as the velocity of the cart and boxes just before the cart stopped

Make a Model

Inertia Have students use their textbooks to model the situation in **Figure 3**. Stack one book on top of the other. Gently accelerate the stack by pushing on the bottom book, then bring the bottom book to a sudden stop and observe the motion of the top book.

Figure 3 The inertia of the boxes causes them to keep moving after the cart has been brought to a sudden stop.

Describe the velocity of the boxes just after the cart stops.

Inertia and the First Law of Motion According to the first law of motion, the velocity of an object doesn't change unless the forces acting on the object are unbalanced. In other words, if you observe a change in an object's velocity, you know an unbalanced force acted on it. This is similar to the definition of inertia—an object resists a change in its motion. As a result, the first law of motion sometimes is called the law of inertia.

Inertia and the first law of motion explain why the boxes in **Figure 3** slide off the cart when the cart comes to a sudden stop. The student applies an unbalanced force to the cart that makes it stop. However, the inertia of the boxes causes them to keep moving even after the cart stops.

Figure 4 This crash test dummy is not restrained in this low-speed crash. Inertia causes the dummy to slam into the steering wheel.

What happens in a crash?

The first law of motion can explain what happens in a car crash. When a car traveling 50 km/h collides head-on with something solid, the car crumples, slows down, and stops within about 0.1 s. Any passenger not wearing a safety belt continues to move forward at the same speed the car was traveling. Within about 0.02 s after the car stops, unbelted passengers slam into the dashboard, windshield, or steering wheel, as shown in **Figure 4**. Passengers in the back seat might slam into the backs of the front seats. Because of their inertia, they are traveling at the car's original speed of 50 km/h—about the same speed they would reach falling from a three-story building.

Differentiated Instruction

Challenge Have students prepare a diagram showing the four forces acting on an ice-skater skating forward. Explain why the skater is able to move forward for a relatively long period of time. Possible answer: The four forces are gravity pulling down

on the skater, the ice pushing up, the ice pushing forward in response to the skater's push on the ice, and friction pulling the skater back. Since the ice provides relatively little friction, the skater's inertia keeps him or her moving forward for a relatively long time. **L3** **LM** Logical-Mathematical **P**

Safety Belts In **Figure 5** the crash test dummies are restrained with safety belts. As a result, they slow down at the same rate that the car slows down. However, the force exerted on a person that slows from 50 km/h to 0 km/h in 0.1 s is about 14 times as large as the force of gravity on the person. To further reduce the force acting on a person, the seat belt loosens slightly, increasing the time it takes to slow the person. Increasing the time needed to stop reduces the force exerted on the person. The safety belt also prevents the person from being thrown out of the car. Car-safety experts say that about half the people who die in car crashes would survive if they wore safety belts.

✓ Reading Check What are two advantages of wearing a safety belt in a crash?

The Second Law of Motion

According to Newton’s first law of motion, unbalanced forces cause the velocity of an object to change. Newton’s second law of motion describes how the net force on an object, its mass, and its acceleration are related.

Force and Acceleration What’s different about throwing a ball horizontally as hard as you can and tossing it gently? When you throw hard, the net force on the ball is greater than when you toss it. Also, the ball has a greater velocity when it leaves your hand. As a result, the hard-thrown ball has a greater change in velocity, and this change can occur over a shorter period of time. Recall that acceleration is the change in velocity divided by the time needed for the change to occur. So, a hard-thrown ball has a greater acceleration than a gently-thrown ball.

Mass and Acceleration If you throw a baseball and a softball with the same amount of force, why does the baseball move faster? A softball has more mass than a baseball. Even though the net force exerted on both balls is the same, the softball has less velocity when it leaves your hand than the baseball does. If it takes the same amount of time to throw both balls, the acceleration of the softball is less than that of the baseball. So, the acceleration of an object depends on its mass, as well as the net force exerted on it. Net force, mass, and acceleration are related.

Figure 5 These crash test dummies were restrained with safety belts in this crash. This prevented the dummies from hitting the dashboard or windshield.

Science

Topic: Motion in Sports

Visit fl.gpscience.com for Web links to information about methods used to analyze the motions of athletes.

Activity Choose a sport and write a report on how analyzing the motions involved in the sport can improve performance and reduce injuries.

Activity
Safety Belts Contact your local state patrol office to have an officer speak to the class about the advantages of wearing safety belts. Tell the officer ahead of time that you are studying the forces experienced by a person during a crash so that topic can be addressed. Afterward, have students write in their Science Journal about what they have learned from the officer. **L2 LS**
Auditory-Musical

Discussion

Air Bags How do air bags prevent injuries during a car crash? Air bags increase the time over which a force acts to slow the motion of a body. The increased time decreases the force required to stop the body, thus reducing the chance for serious injury. **L3 LS**
Logical-Mathematical

✓ Reading Check
Answer decreases the magnitude of the force necessary to stop the passenger (increases the time over which the acceleration takes place); prevents the passenger from being thrown out of the car

Quick Demo

Newton's Second Law

Materials flexible plastic ruler, table-tennis ball, golf ball, flat surface

Estimated Time five minutes

Procedure Place a flexed ruler next to a golf ball and release the ruler. Observe the motion of the ball, and measure the distance it travels. Repeat using a table tennis ball. Be sure to keep the launch force constant by bending the ruler back the same amount each time. **L2** **ELL** **AS** **Visual-Spatial**

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

Answers to Practice Problems

1. 4 m/s^2
2. 28,800 N
3. 1,500 kg

The Second Law of Motion

Newton's **second law of motion** states that the acceleration of an object is in the same direction as the net force on the object, and that the acceleration can be calculated from the following equation:

Newton's Second Law of Motion

$$\text{acceleration (in meters/second}^2\text{)} = \frac{\text{net force (in newtons)}}{\text{mass (in kilograms)}}$$

$$a = \frac{F_{\text{net}}}{m}$$

Applying Math

Solve a Simple Equation

THE ACCELERATION OF A SLED You push a friend on a sled. Your friend and the sled together have a mass of 70 kg. If the net force on the sled is 35 N, what is the sled's acceleration?

IDENTIFY known values and the unknown value

Identify the known values:

The net force on the sled is 35 N $\Rightarrow F_{\text{net}} = 35 \text{ N}$

Your friend and the sled together have a mass of 70 kg $\Rightarrow m = 70 \text{ kg}$

Identify the unknown value:

What is the sled's acceleration? $\Rightarrow a = ? \text{ m/s}^2$

SOLVE the problem

Substitute the known values $F_{\text{net}} = 35 \text{ N}$ and $m = 70 \text{ kg}$ into the equation for Newton's second law of motion:

$$a = \frac{F_{\text{net}}}{m} = \frac{35 \text{ N}}{70 \text{ kg}} = 0.5 \frac{\text{N}}{\text{kg}} = 0.5 \frac{\text{kg} \cdot \text{m}}{\text{s}^2} \times \frac{1}{\text{kg}} = 0.5 \text{ m/s}^2$$

CHECK your answer

Does your answer seem reasonable? Check your answer by multiplying the acceleration you calculated by the mass given in the problem. The result should be the net force given in the problem.

Practice Problems

1. If the mass of a helicopter is 4,500 kg, and the net force on it is 18,000 N, what is the helicopter's acceleration?
2. What is the net force on a dragster with a mass of 900 kg if its acceleration is 32.0 m/s^2 ?
3. A car is being pulled by a tow truck. What is the car's mass if the net force on the car is 3,000 N and it has an acceleration of 2.0 m/s^2 ?

For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

LAB DEMONSTRATION

Purpose observe how unbalanced forces affect the velocity of an object

Materials video camera and player, cart, binders, books, metric tape measure

Preparation Film a cart rolling down a slope and then rolling up another slope, with a tape measure placed along the path.

Procedure Show the video one frame at a time. Have students compare the distances the cart moves between each frame on the two slopes.

Expected Outcome The cart moves farther between each frame as it goes downhill and moves a shorter distance between each frame as it goes uphill.

Assessment

What is the direction of the net force acting on the car in each section of the path? **in the direction of motion when it is rolling downhill; opposite the motion when it is rolling uphill.** **L2** **AS** **Visual-Spatial**

Calculating Net Force with the Second Law Newton's second law also can be used to calculate the net force if mass and acceleration are known. To do this, the equation for Newton's second law must be solved for the net force, F . To solve for the net force, multiply both sides of the above equation by the mass:

$$m \times \frac{F_{\text{net}}}{m} = ma$$

The mass, m , on the left side cancels, giving the equation:

$$F_{\text{net}} = ma$$

For example, when the tennis player in **Figure 6** hits a ball, the ball might be in contact with the racket for only a few thousandths of a second. Because the ball's velocity changes over such a short period of time, the ball's acceleration could be as high as $5,000 \text{ m/s}^2$. The ball's mass is 0.06 kg , so the net force exerted on the ball would be:

$$F_{\text{net}} = ma = (0.06 \text{ kg}) (5,000 \text{ m/s}^2) = 300 \text{ kg m/s}^2 = 300 \text{ N}$$

Figure 6 The tennis racket exerts a force on the ball that causes it to accelerate.

Post Reading

Fix-Up Strategy Model this strategy with a challenging section of text. Tell students you will reread the section aloud to enhance meaning. As you read, identify and talk about confusing parts. Sound out words, slow down, and ask questions. Next, allow students to practice the strategy using another section.

3 Assess

DAILY INTERVENTION

Check For Understanding
Auditory-Musical Divide students into small groups. Have students create a song that explains balanced and unbalanced forces. Students may perform their songs for the class as a review. **L2**

Reteach
Tie a string around a book and suspend it. Cut the string. Ask students to describe the forces acting on the book before and after you cut the string. **Before the string was cut, the force of gravity was pulling down on the book. The string exerted an equal upward force on the book. Since these forces were equal and opposite in direction, the book was at rest. After the string was cut, there was no upward force on the book. The force of gravity was not opposed, so the book fell to the floor.** **L1 ELL**

section 1 review

Summary

Inertia and the First Law of Motion

- According to Newton's first law of motion, the velocity of an object does not change unless an unbalanced net force acts on the object.
- The inertia of an object is the tendency of the object to resist a change in motion.
- The larger the mass of an object, the greater its inertia.
- In a car crash, inertia causes an unrestrained passenger to continue moving at the speed of the car before the crash.

The Second Law of Motion

- The acceleration of an object depends on the mass of the object and the net force exerted on the object.
- According to Newton's second law of motion, the acceleration of an object is in the direction of the net force on the object, and can be calculated from this equation:

$$a = \frac{F_{\text{net}}}{m}$$

Self Check

- Infer** whether the inertia of an object changes as the object's velocity changes.
- Determine** whether or not there must be an unbalanced force acting on any object that is moving. Explain.
- Determine** whether or not there can be forces acting on an object that is at rest. Explain.
- Infer** the net force on a refrigerator if you push on the refrigerator and it doesn't move.
- Think Critically** Describe three situations in which a force changes the velocity of an object. Let at least one of the situations involve the force due to gravity.

Applying Math

- Calculate Mass** You push yourself on a skateboard with a force of 30 N and accelerate at 0.5 m/s^2 . Find the mass of you and the skateboard together.
- Calculate Net Force** You push a book that has a mass of 2.0 kg so that it has an acceleration of 1.0 m/s^2 . What is the net force on the book?

section 1 review

- No; the inertia is related to the amount of mass and doesn't change.
- If an object is moving with a constant velocity, then no unbalanced force is acting on it.
- An object can be at rest if the forces acting on it are balanced.
- The net force is zero.
- Possible answers: force exerted by baseball bat changes velocity of pitched ball, gravity causes ball thrown upward to fall, force exerted by person lifting book from desk
- 60 kg
- 2 N

MA.B.1.4.2

Assessment

Oral Have students discuss the forces that enable a kite to stay in the air. Gravity pulls down on the kite. The wind blowing on the surface area of the kite results in an upward net force on the kite. This upward net force allows the kite to overcome gravity and fly. The tension in the string prevents the kite from flying away. Use **PASC**, p. 143.

Tie to Prior Knowledge

Gravity's Effect on a Football Ask students to describe how a football must be thrown for a long pass. Explain that in this section they will learn how the force of gravity affects the motion of projectiles such as a football.

Word Relationships Ask students to determine the relationships between the new vocabulary words. For instance, students might suggest that weight is the pull of gravity. Allow them to use the text to develop their ideas. Have students share with the class.

Reading Guide

FCAT Vocabulary

What You'll Learn

- Describe the gravitational force.
- Distinguish between mass and weight.
- Explain why objects that are thrown will follow a curved path.
- Compare circular motion with motion in a straight line.

Why It's Important

There is a gravitational force between you and every other object in the universe.

Review Vocabulary

acceleration: the rate of change of velocity which occurs when an object changes speed or direction

New Vocabulary

- gravity
- weight
- centripetal acceleration
- centripetal force

Figure 7 The gravitational force between two objects depends on their masses and the distance between them.

Increasing the mass of either object increases the gravitational force between them.

If the objects are closer together, the gravitational force between them increases.

What is gravity?

There's a lot about you that's attractive. At this moment, you are exerting an attractive force on everything around you—your desk, your classmates, even the planet Jupiter millions of kilometers away. It's the attractive force of gravity.

Anything that has mass is attracted by the force of gravity. **Gravity** is an attractive force between any two objects that depends on the masses of the objects and the distance between them. This force increases as the mass of either object increases, or as the objects move closer, as shown in **Figure 7**.

You can't feel any gravitational attraction between you and this book because the force is weak. Only Earth is both close enough and has a large enough mass that you can feel its gravitational attraction. While the Sun has much more mass than Earth, the Sun is too far away to exert a noticeable gravitational attraction on you. And while this book is close, it doesn't have enough mass to exert an attraction you can feel.

Gravity—A Basic Force Gravity is one of the four basic forces. The other basic forces are the electromagnetic force, the strong nuclear force, and the weak nuclear force. The two nuclear forces only act on particles in the nuclei of atoms. Electricity and magnetism are caused by the electromagnetic force. Chemical interactions between atoms and molecules also are due to the electromagnetic force.

The Law of Universal Gravitation

For thousands of years, people have observed the night sky and collected data on the motions of the stars and planets. Isaac Newton used some of these data on the motions of planets to formulate the law of universal gravitation, which he published in 1687. This law can be written as the following equation.

The Law of Universal Gravitation

$$\text{gravitational force} = (\text{constant}) \times \frac{(\text{mass 1}) \times (\text{mass 2})}{(\text{distance})^2}$$
$$F = G \frac{m_1 m_2}{d^2}$$

In this equation G is a constant called the universal gravitational constant, and d is the distance between the two masses, m_1 and m_2 . The law of universal gravitation enables the force of gravity to be calculated between any two objects if their masses and the distance between them are known.

The Range of Gravity According to the law of universal gravitation, the gravitational force between two masses decreases rapidly as the distance between the masses increases. For example, if the distance between two objects increases from 1 m to 2 m; the gravitational force between them becomes one fourth as large. If the distance increases from 1 m to 10 m, the gravitational force between the objects is one hundredth as large. However, no matter how far apart two objects are, the gravitational force between them never completely disappears. As a result, gravity is called a long-range force.

Reading Check Why is gravity called a long-range force?

Integrate **Finding Other Planets** Earth's motion around the Sun is affected by the gravitational pulls of the other planets in the solar system. In the same way, the motion of every planet in the solar system is affected by the gravitational pulls of all the other planets.

In the 1840s the most distant planet known was Uranus. The motion of Uranus calculated from the law of universal gravitation disagreed slightly with its observed motion. Some astronomers suggested that there must be an undiscovered planet affecting the motion of Uranus. Using the law of universal gravitation and Newton's laws of motion, two astronomers independently calculated the orbit of this planet. As a result of these calculations, the planet Neptune, shown in **Figure 8**, was found in 1846.

Science

Topic: Gravity on Other Planets

Visit fl.gpscience.com for Web links to information about the gravitational acceleration near the surface of different planets in the solar system.

Activity Make a graph with the gravitational acceleration on the y-axis, and the planet's mass on the x-axis. Infer from your graph how the gravitational acceleration depends on a planet's mass.

Figure 8 The location of the planet Neptune in the night sky was correctly predicted using Newton's laws of motion and the law of universal gravitation.

Quick Demo

Gravitational Acceleration

Materials water, bucket, plastic cup

Estimated Time five minutes

Procedure Punch a hole in the bottom of the cup. Place your finger over the hole and fill the cup with water. Hold the cup as high over your head as you can, and let it drop into the bucket. Have students observe that the water and the cup fall at the same rate, so no water drains out of the cup as it falls. **L2 ELL IS**

Visual-Spatial

Reading Check

Answer It never disappears, regardless of distance between objects.

Content Background

Finding Other Planets Astronomers use several techniques to find evidence of planets outside the solar system. Some rely on measuring the periodic motion of the star due to the planet's gravitational pull as it orbits the star. Other techniques measure the slight dimming of a star as a planet passes between the star and the telescope. Using these techniques, astronomers have discovered over 125 extrasolar planets.

Fun Fact

Newton's law of gravitation states that the gravitational attraction between two objects is $F = G(m_1 m_2)/d^2$, where d is the distance between the two objects and G is the universal gravitational constant. In 1798, Henry Cavendish performed experiments that verified Newton's law. Based on his work and the work of others, the value of G is now known to be approximately $6.67 \times 10^{-11} \text{ m}^3/\text{kg} \cdot \text{s}^2$.

Reading Strategy

Determine Main Ideas Have students read The Law of Gravitation, Earth's Gravitational Acceleration, Weightlessness and Free Fall, Projectile Motion, and Centripetal Force. Ask students to write two to four sentences describing the main ideas of each section. Bold print, captions, and headings offer clues to main ideas.

Differentiated Instruction

Challenge Have students show how Newton's first law can be derived from Newton's second law. **Newton's second law says $F = ma$. If $F = 0$ then $a = 0$. If $a = 0$ the velocity of the object doesn't change. It remains at rest or continues to move in a straight line at constant velocity.** **L3 IS**

Logical-Mathematical

Quick Demo

Mass and Falling Speed

Materials golf ball, table-tennis ball

Estimated Time 15 minutes

Procedure Bring a golf ball and a table tennis ball to class. Have volunteers determine the mass of each ball and write it on the board. Then drop both balls from the same height for the class to observe. Have the class decide whether one ball hit the floor before the other. L2 IS

Visual-Spatial

Text Question Answer

The bowling ball and the marble would hit the ground at the same time. They have the same acceleration, so their velocities are the same as they fall.

IDENTIFYING

Misconceptions

Mass v. Weight People in Europe and other places that use SI units usually express their weight in kilograms. This is technically incorrect, as the kilogram is a unit of mass, not weight.

Activity

Weight Conversion Have students calculate their mass in kilograms, then use their answers to calculate their weight in newtons. Make sure students know that the weight of one kilogram is 2.2 pounds. L2 IS

Logical-Mathematical

Figure 9 Time-lapse photography shows that two balls of different masses fall at the same rate.

Earth's Gravitational Acceleration

If you dropped a bowling ball and a marble at the same time, which would hit the ground first? Suppose the effects of air resistance are small enough to be ignored. When all forces except gravity acting on an a falling object can be ignored, the object is said to be in free fall. Then all objects near Earth's surface would fall with the same acceleration, just like the two balls in **Figure 9**.

Close to Earth's surface, the acceleration of an object in free fall is 9.8 m/s^2 . This acceleration is the gravitational acceleration and is given the symbol g . By the second law of motion, the gravitational force exerted by Earth on a falling object is the object's mass times the gravitational acceleration. The gravitational force can be calculated from this equation:

Gravitational Force Equation

$$\begin{aligned}\text{gravitational force (N)} \\ &= \text{mass (kg)} \times \text{gravitational acceleration (m/s}^2\text{)} \\ F &= mg\end{aligned}$$

For example, the gravitational force on a skydiver with a mass of 60 kg would be

$$F = mg = (60 \text{ kg}) (9.8 \text{ m/s}^2) = 588 \text{ N}$$

Weight Even if you are not falling, the force due to Earth's gravity still is pulling you downward. If you are standing on a floor, the net force on you is zero. The force due to Earth's gravity pulls you downward, but the floor exerts an upward force on you that balances gravity's downward pull.

Whether you are standing, jumping, or falling, Earth exerts a gravitational force on you. The gravitational force exerted on an object is called the object's **weight**. The weight of an object on Earth is equal to the gravitational force exerted by Earth on the object. As a result, near Earth's surface an object's weight can be calculated from this equation:

Weight Equation

$$\begin{aligned}\text{weight (N)} &= \text{mass (kg)} \times \text{gravitational acceleration (m/s}^2\text{)} \\ W &= mg\end{aligned}$$

On Earth, where g equals 9.8 m/s^2 , a cassette tape weighs about 0.5 N, a backpack full of books could weigh 100 N, and a jumbo jet weighs about 3.4 million N.

Differentiated Instruction

Challenge Ask students to identify the force that opposes gravity and enables objects to float in water. **The buoyant force of the water acts on an object with a force equal to the weight of the water displaced by the object.** If the buoyant force is equal to the force of gravity pulling on the object, the object will float. This occurs when the object is less dense than water. L3 IS **Logical-Mathematical**

Science Journal

Lower Gravity Ask students to imagine that, during the next few days, the gravitational force of Earth gradually becomes half of what it is now. Have students write in their Science Journals about the changes that might take place. **Students might describe balls bouncing higher, people jumping higher, increased ease of walking and running.**

Weight and Mass Weight and mass are not the same. Weight is a force and mass is a measure of the amount of matter an object contains. However, according to the weight equation on the previous page, weight and mass are related. Weight increases as mass increases.

The weight of an object usually is the gravitational force between the object and Earth. But the weight of an object can change, depending on the gravitational force on the object. For example, the acceleration due to gravity on the Moon is 1.6 m/s^2 , about one sixth as large as Earth's gravitational acceleration. As a result, a person, like the astronaut in **Figure 10**, would weigh only about one sixth as much on the Moon as on Earth. **Table 1** shows how various weights on Earth would be different on the Moon and some of the planets.

Reading Check How are weight and mass related?

Weightlessness and Free Fall

You've probably seen pictures of astronauts and equipment floating inside the space shuttle. Any item that is not fastened down seems to float throughout the cabin. They are said to be experiencing the sensation of weightlessness.

However, for a typical mission, the shuttle orbits Earth at an altitude of about 400 km. According the law of universal gravitation, at 400-km altitude the force of Earth's gravity is about 90 percent as strong as it is at Earth's surface. So an astronaut with a mass of 80 kg still would weigh about 700 N in orbit, compared with a weight of about 780 N at Earth's surface.

Table 1 Weight Comparison Table

Weight on Earth (N)	Weight on Other Bodies in the Solar System (N)				
	Moon	Venus	Mars	Jupiter	Saturn
75	12	68	28	190	87
100	17	90	38	254	116
150	25	135	57	381	174
500	84	450	190	1,270	580
700	119	630	266	1,778	812
2,000	333	1,800	760	5,080	2,320

Figure 10 On the Moon, the gravitational force on the astronaut is less than it is on Earth. As a result, the astronaut can take longer steps and jump higher than on Earth.

Describe how the astronaut's mass and weight on the Moon compare to his mass and weight on Earth.

Discussion

Weight and Mass Why is it that an object has mass in and of itself, but must interact with another object for it to have weight? **Mass** is a measure of the amount of matter an object contains. Weight is a measure of gravitational force, which only occurs between objects.

Activity

Collecting Data To help students become familiar with the relationship between an object's mass and its weight on Earth, have groups of students work together to make a table listing the weights and masses of various objects. Students should first use a balance to determine the object's mass in kilograms and then calculate the weight by multiplying the mass by 9.8 m/s^2 . **L2 ELL IS Kinesthetic**

Reading Check

Answer Weight equals mass times acceleration due to gravity.

Quick Demo

Simulating Gravity

Materials marble, shallow pan

Estimated Time 15 minutes

Procedure One way to overcome weightlessness in space is to build a space station in the shape of a large, doughnut-shaped ring called a torus. If the torus is set spinning in outer space, the centripetal force would cause people inside to feel as if they are being pushed toward the outer wall, simulating gravity. Demonstrate this to students by swirling a marble in a shallow pan. **L3 IS Visual-Spatial**

Teacher FYI

Acceleration Due to Gravity Near Earth's surface, acceleration due to gravity (g) is approximately 9.8 m/s^2 . This value varies by only a fraction of a percent even on top of Mount Everest. The value of g decreases as you travel away from Earth's surface. At a height of 1,000 km, it is about $3/4$ the value at Earth's surface.

Active Reading

Reflective Journal In this strategy, students record their responses to various activities and what they learned from each. Have them divide sheets of paper into five columns: *What I Did*, *What I Learned*, *Questions I Have*, *What Surprised Me*, and *Overall Response*. Have students write a reflective journal entry for the activities about gravity in this section.

Caption Answer

Figure 10 mass is the same; weight is less on the moon

Activity

Using a Spring Scale Have students hang an object from a spring scale to determine its weight. Next, have them compare this with the force recorded on the scale when the object is moved rapidly up and rapidly down. Have students explain the results. **The downward force exerted by the object on the scale is the force recorded on the scale, and equals the upward force exerted by the scale on the object.** When the object isn't accelerating, the scale exerts an upward force on the object equal to its weight. When the object is accelerating upward, the upward force on the object exerted by the scale is greater than its weight. When the object is accelerating downward, the upward force on the object exerted by the scale is less than its weight. [L3] [IS]

Logical-Mathematical

Gravity and Earth's Atmosphere

The force of gravity also has caused the shape of the Earth and other bodies in the solar system to be spherical. During Earth's formation, gravity caused denser material such as iron and nickel to sink toward the center of earth, where they now form Earth's core. Less dense materials such as silicates and water were left at Earth's surface, where they now form Earth's crust and oceans.

Use Science Words

Word Origins Ask students to find the origin of the word *projectile*. The word projectile comes from the Latin prefix *pro-*, which means "forward," and the Latin verb *iacere*, which means "to throw." [L2] [IS] **Linguistic**

Answer gravitational force

A When the elevator is stationary, the scale shows the boy's weight.

B If the elevator were in free fall, the scale would show a zero weight.

Figure 11 The boy and the scale no longer exert forces on each other when they both are in free fall. As a result, the boy seems to be weightless.

Gravity and Earth's Atmosphere

Atmosphere Apart from simply keeping your feet on the ground, gravity is important for life on Earth for other reasons, too. Because Earth has a sufficient gravitational pull, it can hold around it the oxygen/nitrogen atmosphere necessary for sustaining life. Research other ways in which gravity has played a role in the formation of Earth.

Floating in Space Why do objects seem weightless in orbit? Think about measuring your weight. When you stand on a scale, as in **Figure 11A**, the net force on you is zero. The scale exerts an upward force on you equal to your weight. Now suppose you stand on a scale in an elevator that is in free fall, as shown in **Figure 11B**. Then the only force acting on you is the gravitational force. You and the scale no longer exert forces on each other. The scale would show zero weight, even though the gravitational force on you hasn't changed.

✓ Reading Check What is the only force on an object in free fall?

A space shuttle in orbit is in free fall, but it is falling around Earth, rather than straight downward. Everything in the orbiting space shuttle is falling around Earth at the same rate, in the same way you and the scale were falling in the elevator. Objects in the shuttle seem to be floating because they are all falling with the same acceleration.

Projectile Motion

If you've tossed a ball to someone, you've probably noticed that thrown objects don't always travel in straight lines. They curve downward. Anything that's thrown or shot through the air is called a projectile. Earth's gravity causes projectiles to follow a curved path.

Curriculum Connection

Health Pictures of objects floating around in a spaceship make weightlessness look like fun, but weightlessness can have an adverse effect on the health of astronauts. Have students research this problem and prepare a report about some effects. Some problems astronauts experience are loss of bone density and muscle atrophy. [L2] [P] [IS] **Linguistic**

Distance and Launch Angle

Purpose Students design an experiment to show how the horizontal distance traveled by a projectile is affected by its initial launch angle.

Possible Materials meterstick, protractor, rubber bands, boards about 5 cm × 12 cm, nails small rubber stopper or a toy rubber-tipped dart gun

Estimated Time one class period

Possible Procedure

1. Have students build a sling-shot using the board, nails, and rubber band to launch the rubber stopper (or use the dart gun).
2. Launch the rubber stopper at different angles from the same elevation. Keep the launch force the same.
3. Measure the horizontal distance traveled by the projectile at each angle.
4. Plot the results on a graph of angle versus distance.
5. Infer which angles give the greatest horizontal distance.

Teaching Strategy Wear protective eye gear and caution students not to aim at anything breakable or each other. They should find that complementary angles give the same horizontal distance. **L3 LS**

Logical-Mathematical

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Visual Learning

Figure 13 Point out that the spacing of the balls with respect to the horizontal is identical. This shows that the balls have the same vertical acceleration. The horizontal and vertical accelerations are separate. Ask students what the result would be if one of the balls had greater mass. **The result would be the same.** **L2 LS**
Visual-Spatial

Figure 12 The pitcher gives the ball a horizontal motion. Gravity, however, is pulling the ball down. The combination of these two motions causes the ball to move in a curved path.

Horizontal and Vertical Motions When you throw a ball, like the pitcher in **Figure 12**, the force exerted by your hand pushes the ball forward. This force gives the ball horizontal motion. After you let go of the ball, no force accelerates it forward, so its horizontal velocity is constant, if you ignore air resistance.

However, when you let go of the ball, gravity can accelerate it downward, giving it vertical motion. Now the ball has constant horizontal velocity but increasing vertical velocity. Gravity exerts an unbalanced force on the ball, changing the direction of its path from only forward to forward and downward. The result of these two motions is that the ball appears to travel in a curve, even though its horizontal and vertical motions are completely independent of each other.

Horizontal and Vertical Distance If you were to throw a ball as hard as you could from shoulder height in a perfectly horizontal direction, would it take longer to reach the ground than if you dropped a ball from the same height? Surprisingly, it won't. A thrown ball and one dropped will hit the ground at the same time. Both balls in **Figure 13** travel the same vertical distance in the same amount of time. However, the ball thrown horizontally travels a greater horizontal distance than the ball that is dropped.

Figure 13 Multiframe photography shows that each ball has the same acceleration downward, whether it's thrown or dropped.

Differentiated Instruction

Challenge Have students explain the following problem, using both diagrams and written expression: If one bullet is dropped from the same altitude and at the same time that an identical bullet is fired horizontally from a gun, they both hit the ground at the same time (but not the same place). Which bullet will hit first if one is fired at an upward angle

at the same time the second is dropped? **When the gun is fired horizontally, both bullets have the same initial vertical speed (0) and the same vertical acceleration (9.8 m/s^2). They land at the same time. When one bullet is fired at an upward angle, they do not have the same initial vertical speed.** **L3 LS**
Logical-Mathematical

Use Science Words

Word Usage Have students explain how the definition of the word **centripetal** describes the force exerted on a ball on a string that you swing around your head. Centripetal means “moving toward the center.” The tension in the string pulls the ball toward the center. L2 

Linguistic

Caption Answer

Figure 14 gravity; force exerted by the wall of the tube on the ball

Purpose to observe the effect of centripetal force

Materials string; plastic, slotted golf ball

Teaching Strategy Suggest to students that they perform this experiment outside.

Analysis

1. centripetal force
2. The faster the ball swings, the more tension there is on the string.

Assessment

Process Show students a picture of a satellite in orbit. Ask them to diagram the forces acting on the satellite. The centripetal force of Earth's gravity pulls the satellite toward Earth. Use PASC, p. 127.

Figure 14 When the ball moves through the curved portions of the tube, it is accelerating because its velocity is changing. **Identify** the forces acting on the ball as it falls through the tube.

Observing Centripetal Force

Procedure 

1. Thread a string about 1 m long through the holes of a plastic, slotted ball.
2. Swing the ball in a vertical circle.
3. Swing the ball at different speeds and observe the motion of the ball and the tension in the string.

Analysis

1. What force does the string exert on the ball when the ball is at the top, sides, and bottom of the swing?
2. How does the tension in the string depend on the speed of the ball?

Centripetal Force

Look at the path the ball follows as it travels through the curved tube in **Figure 14**. The ball may accelerate in the straight sections of the pipe maze if it speeds up or slows down. However, when the ball enters a curve, even if its speed does not change, it is accelerating because its direction is changing. When the ball goes around a curve, the change in the direction of the velocity is toward the center of the curve. Acceleration toward the center of a curved or circular path is called **centripetal acceleration**.

According to the second law of motion, when the ball has centripetal acceleration, the direction of the net force on the ball also must be toward the center of the curved path. The net force exerted toward the center of a curved path is called a **centripetal force**. For the ball moving through the tube, the centripetal force is the force exerted by the walls of the tube on the ball.

Centripetal Force and Traction When a car rounds a curve on a highway, a centripetal force must be acting on the car to keep it moving in a curved path. This centripetal force is the frictional force, or the traction, between the tires and the road surface. If the road is slippery and the frictional force is small, the centripetal force might not be large enough to keep the car moving around the curve. Then the car will slide in a straight line. Anything that moves in a circle, such as the people on the amusement park ride in **Figure 15**, is doing so because a centripetal force is accelerating it toward the center.

Figure 15 Centripetal force keeps these riders moving in a circle.

Differentiated Instruction

Learning Disabled Make sure students realize that as an object moves in a circle, its change in direction is toward the center of the circle. Students can show this by moving a brick along the edge of a large circle. Every time they move the brick, they must twist it a bit so it fits on the circle. This twist shows the change in direction.

Figure 16 The Moon would move in a straight line except that Earth's gravity keeps pulling it toward Earth. This gives the Moon a nearly circular orbit.

Gravity Can Be a Centripetal Force Imagine whirling an object tied to a string above your head. The string exerts a centripetal force on the object that keeps it moving in a circular path. In the same way, Earth's gravity exerts a centripetal force on the Moon that keeps it moving in a nearly circular orbit, as shown in **Figure 16**.

section 2 review

Summary

Gravity

- According to the law of universal gravitation, the gravitational force between two objects depends on the masses of the objects and the distance between them.
- The acceleration due to gravity near Earth's surface has the value 9.8 m/s^2 .
- Near Earth's surface, the gravitational force on an object with mass, m , is given by:
 $F = mg$

Weight

- The weight of an object is related to its mass according to the equation:
 $W = mg$
- An object in orbit seems to be weightless because it is falling around Earth.

Projectile Motion and Centripetal Force

- Projectiles follow a curved path because their horizontal motion is constant, but gravity causes the vertical motion to be changing.
- The net force on an object moving in a circular path is called the centripetal force.

Self Check

- Describe** how the gravitational force between two objects depends on the mass of the objects and the distance between them.
- Distinguish** between the mass of an object and the object's weight.
- Explain** what causes the path of a projectile to be curved.
- Describe** the force that causes the planets to stay in orbit around the Sun.
- Think Critically** Suppose Earth's mass increased, but its diameter didn't change. How would the acceleration due to gravity near Earth's surface change?

Applying Math

- Calculate Weight** On Earth, what is the weight of a large-screen TV that has a mass of 75 kg?
- Calculate Gravity on Mars** Find the acceleration due to gravity on Mars if a person with a mass of 60.0 kg weighs 222 N on Mars.
- Calculate Force** Find the force exerted by a rope on a 10-kg mass that is hanging from the rope.

section 2 review

- It increases as the mass of one or both objects increases, and it decreases as the distance between the objects increases.
- Mass is a measure of the amount of matter an object contains. Weight is a measure of the force of gravity on an object. Weight changes if the gravitational force changes.
- Gravity causes the vertical velocity of the projectile to change.
- The Sun's gravitational force keeps them in orbit.
- Standing on Earth's surface, you would be attracted by a larger mass, so the force of Earth's gravity and the acceleration of gravity would be greater.
- Weight = $mg = 75 \text{ kg} \cdot 9.8 \text{ m/s}^2 = 735 \text{ N}$
- $a = F/m = (222 \text{ N})/(60 \text{ kg}) = 3.7 \text{ m/s}^2$
- $F = ma = 10.0 \text{ kg} \times 9.8 \text{ m/s}^2 = 98 \text{ N}$

Post Reading

Illustrations Have students create graphics or illustrations to explain the key ideas behind the following concepts: gravity, weight, projectile motion, and centripetal force. Remind students to use labeling to highlight central themes. Display illustrations for all to see.

3 Assess

DAILY INTERVENTION

Check For Understanding

Visual-Kinesthetic Toss a tennis ball gently across the room to a student who will catch it. Ask the students to describe the vertical motion of the ball. Did it ever speed up, slow down, or stop vertically? **It slowed down on the way up, stopped and then sped up on the way down.** Ask them to describe the horizontal motion in similar terms. What causes the change in vertical motion of the ball? **gravity** Is there any horizontal force once the ball is released? **no**

Reteach

Measure the Fall Have students measure the distance that either of the two balls shown in **Figure 9** fell between each flash. They can use a bar graph to show distance fallen versus flash number. Ask them to explain how this graph supports the idea that the balls are accelerating downward. **The balls fall farther between successive flashes.** **L2 ELL P LS Logical-Mathematical**

Assessment

Oral Ask students to explain why the astronauts and everything else in the space shuttle behave as if they were weightless. **Everything in the shuttle is in free fall as the shuttle orbits Earth.** Use **PASC**, p. 143.

 Real-World Problem

Purpose Students will observe the effect of air resistance on the gravitational acceleration of different shaped sheets of paper.

L2 **KS** **Kinesthetic**

Process Skills measure, recognize cause and effect, formulate models, compare, infer

Time Required 30 minutes

Alternate Materials Make sure the sheets of paper are identical.

Safety Precautions Caution students to be careful when standing on stools or ladders.

 Procedure

Teaching Strategies Stage a contest to determine which design maximizes the effect of air resistance. Have students practice timing the falling paper before entering data in their tables.

Troubleshooting Have students do at least three trials for each paper drop and record the average time in their data table.

 Conclude and Apply

1. expected outcome: (in order of decreasing time) own design, flat paper, loosely crumpled, tightly crumpled
2. Shapes with greater exposed surface areas create more air resistance and fall more slowly.
3. Answers will vary.

**GRAVITY AND
AIR RESISTANCE**

If you dropped a bowling ball and a feather from the same height on the Moon, they would both hit the surface at the same time. All objects dropped on Earth are attracted to Earth with the same acceleration. But on Earth, a bowling ball and a feather will not hit the ground at the same time. Air resistance slows the feather down.

 Real-World Problem

How does air resistance affect the acceleration of falling objects?

Goals

- **Measure** the effect of air resistance on sheets of paper with different shapes.
- **Design** and create a shape from a piece of paper that maximizes air resistance.

Materials

paper (4 sheets of equal size) stopwatch
scissors masking tape
meterstick

Safety Precautions **Procedure**

1. Copy the data table above in your Science Journal, or create it on a computer.
2. Measure a height of 2.5m on the wall and mark the height with a piece of masking tape.
3. Have one group member drop the flat sheet of paper from the 2.5-m mark. Use the stopwatch to time how long it takes for the paper to reach the ground. Record your time in your data table.

Effects of Air Resistance

Paper Type	Time
Flat paper	
Loosely crumpled paper	
Tightly crumpled paper	
Your paper design	

4. Crumple a sheet of paper into a loose ball and repeat step 3.
5. Crumple a sheet of paper into a tight ball and repeat step 3.
6. Use scissors to shape a piece of paper so that it will fall slowly. You may cut, tear, or fold your paper into any design you choose.

 Conclude and Apply

1. **Compare** the falling times of the different sheets of paper.
2. **Explain** why the different-shaped papers fell at different speeds.
3. **Explain** how your design caused the force of air resistance on the paper to be greater than the air resistance on the other paper shapes.

 Communicating
Your Data

Compare your paper design with the designs created by your classmates. As a class, compile a list of characteristics that increase air resistance.

 Assessment

Process Show students several photographs of falling sky divers and ask them to analyze the sky divers' body positions and infer the order of their velocities. Use PASC, p. 89.

 Communicating
Your Data

Encourage students to electronically represent their design using the appropriate software.

The Third Law of Motion

Reading Guide

FCAT Vocabulary

What You'll Learn

- **State** Newton's third law of motion.
- **Identify** action and reaction forces.
- **Calculate** momentum.
- **Recognize** when momentum is conserved.

Why It's Important

The third law of motion explains how you affect Earth when you walk, and how Earth affects you.

Review Vocabulary

velocity: describes the speed and direction of a moving object

New Vocabulary

- third law of motion
- **momentum**
- law of conservation of momentum

Newton's Third Law

Push against a wall and what happens? If the wall is sturdy enough, usually nothing happens. If you pushed against a wall while wearing roller skates, you would go rolling backward. Your action on the wall produced a reaction—movement backward. This is a demonstration of Newton's third law of motion.

The **third law of motion** describes action-reaction pairs this way: When one object exerts a force on a second object, the second one exerts a force on the first that is equal in strength and opposite in direction. Another way to say this is "to every action force there is an equal and opposite reaction force."

Action and Reaction When a force is applied in nature, a reaction force occurs at the same time. When you jump on a trampoline, for example, you exert a downward force on the trampoline. Simultaneously, the trampoline exerts an equal force upward, sending you high into the air.

Action and reaction forces are acting on the two skaters in **Figure 17**. The male skater is pulling upward on the female skater, while the female skater is pulling downward on the male skater. The two forces are equal, but in opposite directions.

Figure 17 According to Newton's third law of motion, the two skaters exert forces on each other. The two forces are equal, but in opposite directions.

Answer they are acting on different objects

Caption Answer

Figure 18 opposite the direction of expelled gas

Visual Learning

Figure 18 Review the forces that move the car shown here. Draw the car on the board, and indicate gas particles inside the rocket engine. Emphasize that the action force is the rocket engine pushing the gas particles, and the reaction force is the gas particles against the rocket engine. **L2** **IS** Visual-Spatial

INTEGRATE
Career

Space Medicine Astronauts who stay in outer space for extended periods of time may develop health problems. Their muscles, for example, may begin to weaken because they don't have to exert as much force to get the same reaction as they do on Earth. A branch of medicine called space medicine deals with the possible health problems that astronauts may experience. Research some other health risks that are involved in going into outer space.

Figure 18 Newton's third law enables the rocket engine to push the car forward. The rocket engine pushes the hot gases produced by burning fuel backward out of the engine's nozzle. By the third law, the gases exert a force of equal size on the engine in the forward direction.

Infer the direction of the car's acceleration when the rocket engine is fired.

Action and Reaction Forces Don't Cancel If action and reaction forces are equal, you might wonder how some things ever happen. For example, how does a swimmer move through the water in a pool if each time she pushes on the water, the water pushes back on her? According to the third law of motion, action and reaction forces act on different objects. Thus, even though the forces are equal, they are not balanced because they act on different objects. In the case of the swimmer, as she "acts" on the water, the "reaction" of the water pushes her forward. Thus, a net force, or unbalanced force, acts on her so a change in her motion occurs. As the swimmer moves forward in the water, how does she make the water move?

✓ **Reading Check** Why don't action and reaction forces cancel?

Rocket Propulsion Suppose you are standing on skates holding a softball. You exert a force on the softball when you throw the softball. According to Newton's third law, the softball exerts a force on you. This force pushes you in the direction opposite the softball's motion. Rockets use the same principle to move even in the vacuum of outer space. In the rocket engine, burning fuel produces hot gases. The rocket engine exerts a force on these gases and causes them to escape out the back of the rocket. By Newton's third law, the gases exert a force on the rocket and push it forward. The car in **Figure 18** uses a rocket engine to propel it forward. **Figure 19** shows how rockets were used to travel to the Moon.

Science Journal

Newton's Third Law Have students use Newton's third law to describe the similarities between a person walking on a sidewalk and a fish swimming in the ocean. A person exerts a force on the sidewalk, and the sidewalk pushes back on the person, moving the person forward. A fish pushes on water, and the reaction force of the water on the fish propels the fish forward. **L1** **IS** Linguistic

Reading Strategy

Science Journal As students read this chapter, ask them to develop a log of their reading. The log should include main points, sketches, questions regarding the text, and any other thoughts they have as they read the text. Read the logs and respond to students' efforts without assigning a grade.

Figure 19

On the afternoon of July 16, 1969, *Apollo 11* lifted off from Cape Kennedy, Florida, bound for the Moon. Eight days later, the spacecraft returned to Earth, splashing down safely in the Pacific Ocean. The motion of the spacecraft to the Moon and back is governed by Newton's laws of motion.

▶ *Apollo 11* roars toward the Moon. At launch, a rocket's engines must produce enough force and acceleration to overcome the pull of Earth's gravity. A rocket's liftoff is an illustration of Newton's third law: For every action there is an equal and opposite reaction.

▲ As *Apollo* rises, it burns fuel and ejects its rocket booster engines. This decreases its mass, and helps *Apollo* move faster. This is Newton's second law in action: As mass decreases, acceleration can increase.

▶ The lunar module uses other engines to slow down and ease into a soft touchdown on the Moon. A day later, the same engines lift the lunar module again into outer space.

▲ The lunar module returns to the *Apollo* spacecraft, which fires its engines to start it moving toward Earth. As the spacecraft gets closer to Earth, the gravitational force exerted by Earth becomes larger, continually increasing the acceleration of the spacecraft.

SECTION 3 The Third Law of Motion 115

Visualizing Rocket Motion

Have students examine the pictures and read the captions. Then ask the following questions.

When *Apollo 11* was launched, what were the equal and opposite forces? **The thrust from the rocket engines pushed on the rocket and the rocket pushed back.**

As *Apollo* ejected its spent rocket booster, what equation described the relationship between mass and acceleration? **$F = ma$**

As the rocket returns to Earth, why is the rocket able to shut off its engines? **The rocket will continue to move toward Earth after the engines are turned off because of inertia.**

Activity

Apollo 11 Have the students write a poem about the *Apollo 11* mission and Newton's laws of motion. **L2 LS Linguistics P**

Fun Fact

Squid and octopuses use Newton's third law as a means of propulsion. They take in water and forcibly expel it through a siphon in a sudden spurt that pushes them through the water. Squid are very streamlined and can achieve speeds of 37 km/h.

Quick Demo

Newton's Third Law

Materials party balloons, tape, 15-m piece of string, plastic straw, two vertical supports

Estimated Time two minutes

Procedure Put the string through the straw and stretch it between two vertical supports about 10 m apart. Blow up the balloon and tape it to the straw. Let go and have the students observe that air molecules pushing against the front of the balloon propel it backward.

Differentiated Instruction

English-Language Learners Have students write a sentence that describes or includes each of the following words, and then organize the sentences into a paragraph about space travel: rocket, force, spacecraft, booster rocket, gravity, planet, the Moon.

Cultural Diversity

And the Rockets' Red Glare... Centuries ago, the Chinese invented gunpowder. Although it was first used during celebrations, gunpowder was quickly adapted for war purposes. By the fourteenth century, Chinese armies were using it in rockets. When the gunpowder ignited, it expelled hot gases, which propelled the rockets forward.

IDENTIFYING Misconceptions

Force and Momentum Many students confuse the ideas of force and momentum. Sometimes when comparing two moving objects, students will say that one object has more force than the other, when they really should say that the object has more momentum than the other. Be alert for statements such as these during class discussions and help the students to use the scientific terms correctly and precisely.

Discussion

Momentum in Football Momentum is important to football players. What is the advantage of a football player having a large momentum? *It makes it harder to change the player's velocity.*

Florida: MA.B.1.4.2

Answers to Practice Problems

- 36,400 kg·m/s
- 40 m/s
- 65 kg

Virtual Labs

Crash! How is momentum conserved in a vehicle collision?

Momentum

A moving object has a property called momentum that is related to how much force is needed to change its motion. The **momentum** of an object is the product of its mass and velocity. Momentum is given the symbol p and can be calculated with the following equation:

Momentum Equation

$$\text{momentum (kg m/s)} = \text{mass (kg)} \times \text{velocity (m/s)}$$

$$p = mv$$

The unit for momentum is kg·m/s. Notice that momentum has a direction because velocity has a direction.

Applying Math

Solve a Simple Equation

THE MOMENTUM OF A SPRINTER At the end of a race, a sprinter with a mass of 80 kg has a speed of 10 m/s. What is the sprinter's momentum?

IDENTIFY known values and the unknown value

Identify the known values:

a sprinter with a mass of 80 kg $\xrightarrow{\text{means}}$ $m = 80 \text{ kg}$
has a speed of 10 m/s $\xrightarrow{\text{means}}$ $v = 10 \text{ m/s}$

Identify the unknown value:

What is the sprinter's momentum? $\xrightarrow{\text{means}}$ $p = ? \text{ kg}\cdot\text{m/s}$

SOLVE the problem

Substitute the known values $m = 80 \text{ kg}$ and $v = 10 \text{ m/s}$ into the momentum equation:

$$p = mv = (80 \text{ kg})(10 \text{ m/s}) = 800 \text{ kg}\cdot\text{m/s}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the momentum you calculated by the mass given in the problem. The result should be the speed given in the problem.

Practice Problems

- What is the momentum of a car with a mass of 1,300 kg traveling at a speed of 28 m/s?
- A baseball thrown by a pitcher has a momentum of 6.0 kg·m/s. If the baseball's mass is 0.15 kg, what is the baseball's speed?
- What is the mass of a person walking at a speed of 0.8 m/s if their momentum is 52.0 kg·m/s?

For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

Differentiated Instruction

Challenge Newton actually worded his second law as force equals the change in momentum divided by the change in time. Explain how this is equivalent to $F = ma$. $F = ma$; $\Delta p = m\Delta v$; $F = \Delta p/t$; $F = m(\Delta v)/t$; $a = \Delta v/t$ so $F = ma$ **L3** **IS** **Logical-Mathematical**

Post Reading

Science Journal After reading Newton's Third Law, Momentum, and the Law of Conservation of Momentum, have students work in teams to create a demonstration that illustrates the main ideas behind these concepts. Remind students to follow the text when designing their projects. They may also use outside resources.

Visual Learning

Figure 20 Point out that the balls scatter left and right as they are deflected by the cue ball. Tell students that momentum is conserved separately in each direction. Since the balls have the same mass, the sum of the forward velocities of the balls equals the cue ball's initial forward velocity. The sum of the left velocities is equal to the sum of the right velocities. Why do the balls eventually slow and stop? **friction**

Law of Conservation of Momentum The momentum of an object doesn't change unless its mass, velocity, or both change. Momentum, however, can be transferred from one object to another. Consider the game of pool shown in **Figure 20**.

When the cue ball hits the group of balls that are motionless, the cue ball slows down and the rest of the balls begin to move. The momentum the group of balls gained is equal to the momentum that the cue ball lost. The total momentum of all the balls just before and after the collision would be the same. If no other forces act on the balls, their total momentum is conserved—it isn't lost or created. This is the **law of conservation of momentum**—if a group of objects exerts forces only on each other, their total momentum doesn't change.

Figure 20 Momentum is transferred in collisions. **A** Before the collision, only the cue ball has momentum. **B** When the cue ball strikes the other balls, it transfers some of its momentum to them.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Kinesthetic Have two students of different sizes stand facing one another and push on each others' hands, palm to palm, without either student pushing the other over. Ask who is exerting the larger force. **They both exert the same force.** Have one student stand in stocking feet so that he or she slides when pushed. Now which one exerts the greater force? **They are still the same.** If the forces are the same, why does one move and not the other? **One has a higher frictional force keeping him or her stationary.**

Reteach

Action/Reaction Ask students to draw and explain action/reaction force arrows for a box sitting on the ground and for a person running. **L2 IS Visual-Spatial**

section 3 review

Summary

Newton's Third Law

- According to Newton's third law of motion, for every action force, there is an equal and opposite reaction force.
- Action and reaction forces act on different objects.

Momentum

- The momentum of an object is the product of its mass and velocity:

$$p = mv$$

The Law of Conservation of Momentum

- According to the law of conservation of momentum, if objects exert forces only on each other, their total momentum is conserved.
- In a collision, momentum is transferred from one object to another.

Self Check

- Determine** You push against a wall with a force of 50 N. If the wall doesn't move, what is the net force on you?
- Explain** how a rocket can move through outer space where there is no matter for it to push on.
- Compare** the momentum of a 6,300-kg elephant walking 0.11 m/s and a 50-kg dolphin swimming 10.4 m/s.
- Describe** what happens to the momentum of two billiard balls that collide.
- Think Critically** A ballet director assigns slow, graceful steps to larger dancers, and quick movements to smaller dancers. Why is this plan successful?

Applying Math

- Calculate Momentum** What is the momentum of a 100-kg football player running at a speed of 4 m/s?

section 3 review

- You are not accelerating, so $F_{\text{net}} = 0$. The wall pushes back on you with a force equal to the force you push on it. The static friction between your feet and the floor keeps you from moving.
- The rocket exerts a force on gas molecules, pushing them backward.
- The dolphin's momentum is $p = (50 \text{ kg})(10.4 \text{ m/s}) = 520 \text{ kg}\cdot\text{m/s}$. The elephant's momentum is $p = (6,300 \text{ kg})(0.11 \text{ m/s}) = 693 \text{ kg}\cdot\text{m/s}$.
- The two balls exchange momentum.
- It takes less force for a person with

less mass to move quickly than for a person with more mass to do so.

$$6. \ p = mv = 100 \text{ kg} \cdot 4 \text{ m/s} = 400 \text{ kg}\cdot\text{m/s}$$

Assessment

Process Provide students with photographs of various types of activities or collisions. Have them describe how momentum is conserved in each situation. Use **PASC**, p. 89.

Real-World Problem

Purpose Students will observe the effects of mass and velocity on the momentum of rolling objects. **L2** **IS** **Kinesthetic**

Process Skills observe, measure, compare, use numbers, use space/time relationship, sequence, recognize cause and effect, infer

Time Required one class period

Alternate Materials A foam rubber ball, golf ball, or hockey ball could replace the tennis ball and racquetball.

Safety Precautions Caution students never to throw the balls during the activity and to roll the baseball only when other students are clear of the ball's path.

Procedure

Teaching Strategy Have students practice rolling the balls at different speeds and rolling the balls into the softball. Clear away floor space in your room or take students outside to provide enough space for each group.

Goals

- **Observe** and calculate the momentum of different balls.
- **Compare** the results of collisions involving different amounts of momentum.

Materials

meterstick
softball
racquetball
tennis ball
baseball
stopwatch
masking tape
balance

Safety Precautions

The Momentum of Colliding Objects

Real-World Problem

Many scientists hypothesize that dinosaurs became extinct 65 million years ago when an asteroid collided with Earth. The asteroid's diameter was probably no more than 10 km. Earth's diameter is more than 12,700 km. How could an object that size change Earth's climate enough to cause the extinction of animals that had dominated life on Earth for 140 million years? The asteroid could have caused such damage because it may have been traveling at a velocity of 50 m/s, and had a huge amount of momentum. The combination of an object's velocity and mass will determine how much force it can exert. How do the mass and velocity of a moving object affect its momentum?

Momentum of Colliding Balls

Action	Time	Velocity	Mass	Momentum	Distance Softball Moved
Racquetball rolled slowly			0.04		
Racquetball rolled quickly			0.04		
Tennis ball rolled slowly	Answers will vary.	Answers will vary.	0.06	Answers will vary.	Answers will vary.
Tennis ball rolled quickly			0.06		
Baseball rolled slowly			0.14		
Baseball rolled quickly			0.14		

Active Reading

Synthesis Journal In this strategy, students reflect on a project, a paper, or a performance task and plan for personal application. Have each student divide a sheet of paper into three sections labeled *What I did*, *What I learned*, and *How I can use it*. Have students write a Synthesis Journal related to this lab.

Alternative Inquiry Lab

Momentum Supply students with the materials listed for this lab, and ask them to find a way to give each ball the same momentum. Have them design a data table and a method to test when the momentum of each ball is equal to the others.

Using Scientific Methods

Procedure

1. Copy the data table on the previous page in your Science Journal.
2. Use the balance to measure the mass of the racquetball, tennis ball, and baseball. Record these masses in your data table.
3. Measure a 2-m distance on the floor and mark it with two pieces of masking tape.
4. Place the softball on one piece of tape. Starting from the other piece of tape, slowly roll the racquetball toward the center of the softball.
5. Use a stopwatch to time how long it takes the racquetball to roll the 2-m distance and hit the softball. Record this time in your data table.
6. Measure and record the distance the racquetball moved the softball.
7. Repeat steps 4–6, rolling the racquetball quickly.
8. Repeat steps 4–6, rolling the tennis ball slowly, then quickly.
9. Repeat steps 4–6, rolling the baseball slowly, then quickly.

Analyze Your Data

1. **Calculate** the momentum for each type of ball and action using the formula $p = mv$. Record your calculations in the data table.
2. **Graph** the relationship between the momentum of each ball and the distance the softball was moved using a graph like the one shown.

Conclude and Apply

1. **Infer** from your graph how the distance the softball moves after each collision depends on the momentum of the ball that hits it.
2. **Explain** how the motion of the balls after they collide can be determined by Newton's laws of motion.

Communicating Your Data

Compare your graph with the graphs made by other students in your class.
Discuss why the graphs might look different.

119

Assessment

Oral Ask students if it is possible for an object to have a negative value for momentum. **Yes; velocity has both direction and magnitude. Once a positive direction is chosen, velocity in the opposite direction is negative and momentum is negative.** Use PASC, p. 143.

Communicating Your Data

Divide the class into small groups for the discussion so that all students have the opportunity to describe their experiences with the sports.

Tie to Prior Knowledge Students will be aware that more massive moving objects and objects traveling with greater speeds will produce more force.

Analyze Your Data

Expected Outcome The high velocity baseball will have the greatest momentum, and the slow velocity racquetball will have the least momentum.

Answer to Questions

1. Calculations should show that the momentum of a ball increases as its speed increases.
2. The graph should have a positive (diagonally upward) slope.

Error Analysis Have students compare their graphs with other lab groups. Ask which of their predictions matched their results, and have them explain those that did not. Have students identify possible sources of measurement, timing or procedural errors.

Conclude and Apply

1. The graph should show that as the momentum of the colliding ball increases, so does the distance the softball moves.
2. By the third law of motion, when the balls collide, they exert the same force on each other. The softball has the larger mass, so according to the second law its acceleration will be less than the smaller ball.

Content Background

Newton's three laws of motion and the law of universal gravitation have proven to be able to describe the motion of objects ranging from galaxies to raindrops. Newton believed that the forces involved in the behavior of ordinary objects, such as the forces that caused an apple to fall from a tree, were the same forces that controlled the motions of planets and moons. The law of universal gravitation and the three laws of motion applied to all objects. Newton also believed that matter was made of indivisible particles and that the forces of gravity, electricity and magnetism determined the behavior of these particles.

Newton was correct in that gravity, electricity and magnetism also act at the atomic level. However, the gravitational force is so much weaker than the electromagnetic force that it can be ignored at the atomic level. In addition, there are two other forces, the strong and the weak nuclear forces, that are involved in nuclear reactions that were unknown to Newton.

Historical Significance

What Newton contributed to science during his first 25 years cannot be underestimated. More than 300 years later, scientists and engineers still use his laws to understand natural phenomena and to design and develop new technologies.

Newton and the Plague

In 1665, the bubonic plague swept through England and other parts of Europe. Isaac Newton, then a 23-year-old university student, returned to his family's farm until Cambridge university reopened. To occupy his time, Newton made a list of 22 questions. During the next 18 months, Newton buried himself in the search for answers. And in that brief time, Newton developed calculus, the three laws of motion, and the universal law of gravitation!

The Laws of Motion

Earlier philosophers thought that force was necessary to keep an object moving. By analyzing the data collected by Galileo and others, Newton realized that forces did not cause motion. Instead, forces cause a change in motion. Newton came to understand that force and acceleration were related and that objects exert equal and opposite forces on each other. Newton's three laws of

motion were able to explain how all things moved, from an apple falling from a tree to the motions of the moon and the planets, in terms of force, mass, and acceleration.

Isaac Newton was a university student when he developed the laws of motion.

Investigate Research how both Newton's law of gravitation and Einstein's general theory of relativity have been used to develop the current model of the universe.

In Einstein's theory of general relativity, gravity is due to a distortion in space-time.

What is gravity?

Using the calculus and data on the motion of the planets, Newton deduced the law of universal gravitation. This law enabled the force of gravity between any two objects to be calculated, if their masses and the distance between them were known.

Newton was able to show mathematically that the law of universal gravitation predicted that the planets' orbits should be ellipses, just as Johannes Kepler had discovered two generations earlier. The application of Newton's laws of motion and the law of universal gravitation also were able to explain phenomena such as tides, the motion of the moon and the planets, and the bulge at the Earth's equator.

A Different View of Gravity

In 1916, Albert Einstein proposed a different model for gravity called the general theory of relativity. In Einstein's model, objects create distortions in space-time, like a bowling ball dropped on a sheet. What we see as the force of gravity is the motion of an object on distorted space-time. Today, Einstein's theory is used to help explain the nature of the big bang and the structure of the universe.

Investigate The existence of dark matter has been hypothesized to explain the rotations and motions of galaxies that seem to violate Newton's laws of motion. For Newton's laws to be satisfied, these galaxies must contain additional matter that has not been detected directly. Einstein's general theory of relativity explains how the structure of space-time changed as the universe expanded after the big bang.

Resources for Teachers and Students

Isaac Newton: The Greatest Scientist of All Time
Margaret Jean Anderson, Enslow Publishers, Incorporated, 1996

Albert Einstein: Physicist and Genius. Joyce Goldenstern, Enslow Publishers, Incorporated, 1994

Reviewing Main Ideas

Section 1 The First Two Laws of Motion

1. According to the first law of motion, the velocity of an object doesn't change unless an unbalanced net force acts on the object.
2. Inertia is the tendency of an object to resist a change in its motion.
3. The second law of motion states that a net force causes an object to accelerate in the direction of the net force and that the acceleration is given by

$$a = \frac{F_{\text{net}}}{m}$$

Section 2 Gravity

1. Gravity is an attractive force between any two objects with mass. The gravitational force depends on the masses of the objects and the distance between them.
2. The gravitational acceleration, g , near Earth's surface equals 9.8 m/s^2 . The force of gravity on an object with mass, m , is:

$$F = mg$$

3. The weight of an object near Earth's surface is:

$$W = mg$$

Interactive Tutor fl.gpscience.com

4. Projectiles travel in a curved path because of their horizontal motion and vertical acceleration due to gravity.
5. The centripetal force is the net force on an object in circular motion and is directed toward the center of the circular path.

Section 3 The Third Law of Motion

1. Newton's third law of motion states that for every action there is an equal and opposite reaction.
2. The momentum of an object can be calculated by the equation $p = mv$.

3. When two objects collide, momentum can be conserved. Some of the momentum from one object is transferred to the other.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review the laws of motion.

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment

Assessment Transparency The Laws of Motion Chapter 4

Directions: Carefully review the table and answer the following questions.

Mass and Weight on Earth and the Moon				
Object	Mass on Earth	Weight on Earth	Mass on Moon	Weight on Moon
Astronaut	90 kg	882 N	90 kg	149.4 N
Flashlight	1 kg	9.8 N	1 kg	1.7 N
Lunar Rover	650 kg	6370 N	650 kg	1079 N
Moon rocks	22 kg	215.6 N	22 kg	36.5 N

1. According to this information, which object has a weight on the Moon greater than 1000 newtons?
A Astronaut C Lunar Rover
B Flashlight D Moon rocks
2. Astronauts discovered how much easier it is to lift objects on the Moon. The weight of these objects on the Moon is due to _____.
F Earth's gravity
G the Moon's gravity
H Earth's revolution
I the Moon's rotation
3. According to the table, which object weighs the LEAST?
A Astronaut C Lunar Rover
B Flashlight D Moon rocks
4. Based on the data in the table, about how many times greater is the weight of these objects on Earth than on the Moon?
J two times H six times
K four times I eight times

L2

FOLDABLES Have students use their Foldables to review the content of the chapter. Have students work in pairs to describe situations illustrating each of the three laws of motion.

Using Vocabulary

1. Newton's third law of motion
2. momentum
3. weight
4. centripetal force
5. gravity
6. Newton's second law of motion

Checking Concepts

☀ FCAT Vocabulary

Complete each statement using a word(s) from the vocabulary list above.

1. The way in which objects exert forces on each other is described by _____.
2. The _____ of an object depends on its mass and velocity.
3. The _____ of an object is different on other planets in the solar system.
4. When an object moves in a circular path, the net force is called a(n) _____.
5. The attractive force between two objects that depends on their masses and the distance between them is _____.
6. _____ relates the net force exerted on an object to its mass and acceleration.

Checking Concepts

Choose the best answer for each question.

7. What is the gravitational force exerted on an object called?
A) centripetal force C) momentum
B) friction D) weight
8. Which of the following best describes why projectiles move in a curved path?
A) They have horizontal velocity and vertical acceleration.
B) They have momentum.
C) They have mass.
D) They have weight.

9. Which of the following explains why astronauts seem weightless in orbit?
A) Earth's gravity is much less in orbit.
B) The space shuttle is in free fall.
C) The gravity of Earth and the Sun cancel.
D) The centripetal force on the shuttle balances Earth's gravity.

10. Which of the following exerts the strongest gravitational force on you?
A) the Moon C) the Sun
B) Earth D) this book

Use the graph below to answer question 11.

11. The graph shows the speed of a car moving in a straight line. Over which segments are the forces on the car balanced?
A) A and C C) C and E
B) B and D D) D only
12. Which of the following is true about an object in free fall?
A) Its acceleration depends on its mass.
B) It has no inertia.
C) It pulls on Earth, and Earth pulls on it.
D) Its momentum is constant.
13. The acceleration of an object is in the same direction as which of the following?
A) net force C) static friction
B) air resistance D) gravity
14. Which of the following is NOT a force?
A) weight C) momentum
B) friction D) air resistance

Use the ExamView® Pro Test Bank CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

Interpreting Graphics

15. Copy and complete the following concept map on forces.

Use the table below to answer questions 16–18.

Time of Fall for Dropped Objects

Object	Mass (g)	Time of Fall (s)
A	5.0	2.0
B	5.0	1.0
C	30.0	0.5
D	35.0	1.5

16. If the objects in the data table above all fell the same distance, which object fell with the greatest average speed?

Thinking Critically

17. **Describe** the forces acting on a softball after it leaves the pitcher's hand. Ignore the effects of air resistance.
18. **Determine** the direction of the net force on a book sliding on a table if the book is slowing down.
19. **Explain** whether there can be any forces acting on a car moving in a straight line with constant speed.

20. **Explain** You pull a door open. If the force the door exerts on you is equal to the force you exert on the door, why don't you move?
21. **Predict** Suppose you are standing on a bathroom scale next to a sink. How does the reading on the scale change if you push down on the sink?
22. **Describe** the action and reaction force pairs involved when an object falls toward Earth. Ignore the effects of air resistance.

Applying Math

23. **Calculate Mass** Find your mass if a scale on Earth reads 650 N when you stand on it.
24. **Calculate Acceleration of Gravity** You weigh yourself at the top of a high mountain and the scale reads 720 N. If your mass is 75 kg, what is the acceleration of gravity at your location?

Use the figure below to answer question 25.

25. **Calculate Speed** The 2-kg metal ball moving at a speed of 3 m/s strikes a 1-kg wooden ball that is at rest. After the collision, the speed of the metal ball is 1 m/s. Assuming momentum is conserved, what is the speed of the wooden ball?
26. **Calculate Mass** Find the mass of a car that has a speed of 30 m/s and a momentum of 45,000 kg·m/s.
27. **Calculate Sliding Friction** A box being pushed with a force of 85 N slides along the floor with a constant speed. What is the force of sliding friction on the box?

Thinking Critically

17. The only force acting on the ball is the force of gravity.
18. The book is slowing down, so the acceleration is in the direction opposite the motion. The net force is in the same direction as the acceleration.
19. Yes, there can be forces acting on the car, but the forces are balanced so that the net force is zero.
20. The force of static friction between your feet and the floor balances the force the door exerts on you.
21. The reading on the scale decreases because the sink pushes up on you. The upward force exerted by the scale and the sink now balance your weight, so the force exerted by the scale decreases.
22. Earth pulls on the object and the object pulls on Earth.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

$$23. m = \frac{F}{g} = \frac{(650 \text{ N})}{(9.8 \text{ m/s}^2)} = 66.3 \text{ kg}$$

$$24. g = \frac{F}{m} = \frac{(720 \text{ N})}{(75 \text{ kg})} = 9.6 \text{ m/s}^2$$

$$25. m_1 v_1 = m_1 v_1' + m_2 v_2$$

$$2 \text{ kg} \times 3 \text{ m/s} = 6 \text{ kg m/s}$$

$$2 \text{ kg} \times 1 \text{ m/s} = 2 \text{ kg m/s}$$

$$6 \text{ kg m/s} - 2 \text{ kg m/s} = 4 \text{ kg m/s}$$

$$\frac{(4 \text{ kg m/s})}{1 \text{ kg}} = 4 \text{ m/s}$$

$$26. m = \frac{p}{v} = \frac{(45,000 \text{ kg m/s})}{(30 \text{ m/s})} = 1500 \text{ kg}$$

$$27. F = 85 \text{ N}$$

Record your answers on the answer sheet provided by your teacher or on a sheet of paper.
The assessed Florida Benchmark appears above the question.

Multiple Choice

1. The net force on an object moving with constant speed in circular motion is in which direction?
- downward
 - opposite to the object's motion
 - toward the center of the circle
 - in the direction of the object's velocity

Use the table below to answer questions 2–4.

Object in Free Fall with Air Resistance	
Time (s)	Speed (m/s)
0	0
1	9.1
2	15.1
3	18.1
4	19.3
5	19.9

2. Over which of the following time intervals is the acceleration of the object the greatest?
- 0 s to 1 s
 - 1 s to 2 s
 - 4 s to 5 s
 - The acceleration is constant.

Test-Taking Tip

Keep Track of Time If you are taking a timed test, keep track of time. If you find you are spending too much time on a multiple-choice question, mark your best guess and move on.

3. Over which of the following time intervals is the net force on the object the smallest?
- 0 s to 1 s
 - 1 s to 2 s
 - 4 s to 5 s
 - The force is constant.
4. According to the trend in these data, which of the following values is most likely the speed of the object after falling for 6 s?
- 26.7 m/s
 - 15.1 m/s
 - 20.1 m/s
 - 0 m/s

SC.2.A.1

5. Which of the following would cause the gravitational force between object A and object B to increase?
- Decrease the distance between them.
 - Increase the distance between them.
 - Decrease the mass of object A.
 - Decrease the mass of both objects.

Use the graphs below to answer question 6.

6. Which of the graphs on the previous page shows how the force on an object changes if the mass increases and the acceleration stays constant?

A. Graph 1
B. Graph 2
C. Graph 3
D. Graph 4

Gridded Response

SC.142

7. You are pushing a 30-kg wooden crate across the floor. The force of sliding friction on the crate is 90 N. How much force, in newtons, must you exert on the crate to keep it moving with a constant velocity?

8. A skydiver with a mass of 60 kg jumps from an airplane. Five seconds after jumping, the force of air resistance on the skydiver is 300 N. What is the skydiver's acceleration in m/s^2 five seconds after jumping?

Short Response

Use the figure below to answer question 9.

9. Two balls are at the same height. One ball is dropped and the other initially moves horizontally, as shown in the figure. After 1 s, which ball has fallen the greatest vertical distance?

SC.2A.1

10. How does the acceleration of gravity 5,000 km above Earth's surface compare with the acceleration of gravity at Earth's surface?

READ
INQUIRE
EXPLAIN

Extended Response

Use the graph below to answer question 11.

Speed of Sliding Book

SC.C.14.2

11. The graph above shows the how the speed of a book changes as it slides across a table. Over what time interval is the net force on the book in the opposite direction of the book's motion?

SC.C.2A.8

12. When the space shuttle is launched from Earth, the rocket engines burn fuel and apply a constant force on the shuttle until they burn out. Explain why the shuttles acceleration increases while the rocket engines are burning fuel.

Gridded Response

7. 90
8. Force of gravity on skydiver = $(60 \text{ kg})(9.8 \text{ m/s}^2) = 588 \text{ N}$, net force on skydiver = $588 \text{ N} - 300 \text{ N} = 288 \text{ N}$, $a = F_{\text{net}} / m = (288 \text{ N}) / (60 \text{ kg}) = 4.8 \text{ m/s}^2$

Short Response

9. Both balls have fallen the same distance after 1 s. Their vertical motion is independent of their horizontal motion.
10. It is less, because an object at this height is farther from Earth than an object at Earth's surface. According to the law of universal gravitation, the force of gravity decreases as the distance between objects increases. Because the force of gravity decreases, the acceleration due to gravity decreases.

Extended Response

11. After 0.5 s, the book is slowing down, so the acceleration and the net force are opposite to the book's direction of motion.
12. The mass of the rockets is decreasing as the fuel burns, but the force exerted by the rocket engines remains the same. By the second law of motion, the acceleration then must increase.

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubrics on p. 9T.

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Directions: Complete the table. Answer the questions below.

Person	Calories consumed	Activity	Length of activity	Calories burned
1	400	Watching TV	2 h	150
2	200	Walking	1 h	180
3	1 000	Running	$\frac{1}{2}$ h	350
4	450	Playing tennis	1 h	400

- What principle is probably being tested in the above experiment?
 - speed
 - caloric fusion
 - energy conversion
 - gravitational potential energy
- Students conducted an experiment to find which form of exercise burned the most calories. They walked, ran, and did time on the experiment unit's table above. This experiment could be improved by:
 - having the same person do each activity for the same amount of time.
 - recording the time of day each activity was performed
 - recording the temperature during each activity
 - calculating person 2's rate of speed

Meeting Different Ability Levels

Content Outline

Section 1 The Nature of Energy

- Energy is the ability to do work.
- Kinetic energy is energy in motion.
- The amount of kinetic energy an object has depends on its mass and its velocity.
- Potential energy is stored energy.
- Elastic potential energy is energy stored in a stretched or compressed object.
- Gravitational potential energy is energy stored in an object because of its position.
- Thermal potential energy is energy stored in an object because of its temperature.

Section 2 Conservation of Energy

- The total amount of energy in a system remains constant.
- Energy can be transferred from one form to another, but it cannot be created or destroyed.

Meeting Individual Needs

L2

Reinforcement

Section 1 The Nature of Energy

Directions: Read pages 1 to 10 of the textbook that begin with the heading "The Nature of Energy." Then, answer the questions that follow.

- Define energy. What does it mean to say that an object has energy?
- Define kinetic energy. What does it mean to say that an object has kinetic energy?
- Define potential energy. What does it mean to say that an object has potential energy?
- Define elastic potential energy. What does it mean to say that an object has elastic potential energy?
- Define gravitational potential energy. What does it mean to say that an object has gravitational potential energy?
- Define thermal potential energy. What does it mean to say that an object has thermal potential energy?

Directions: Read pages 11 to 15 of the textbook that begin with the heading "Conservation of Energy." Then, answer the questions that follow.

- Define the law of conservation of energy.
- Define the first law of thermodynamics.
- Define the second law of thermodynamics.
- Define the third law of thermodynamics.

Meeting Individual Needs

L2

Enrichment

Section 1 Transferring Kinetic and Potential Energy

Directions: Read pages 16 to 20 of the textbook that begin with the heading "Transferring Kinetic and Potential Energy." Then, answer the questions that follow.

- Define energy transfer. What does it mean to say that energy is transferred from one object to another?
- Define work. What does it mean to say that work is done on an object?
- Define power. What does it mean to say that power is the rate at which work is done?
- Define efficiency. What does it mean to say that efficiency is the ratio of useful work to total work?

Meeting Individual Needs

L3

Directed Reading (English/Spanish)

Section 1 The Nature of Energy

Science Content Background

section The Nature of Energy

What is energy?

Energy is not matter. Electromagnetic energy can exist independent of matter. Other forms of energy, such as chemical energy, can only exist with matter.

Kinetic Energy

The equation for kinetic energy states that $KE = \frac{1}{2}mv^2$. This means that as an object's velocity doubles its kinetic energy quadruples.

Kinetic comes from a Greek word for movement. The word *cinema*—used to describe moving pictures or movies—shares the same root word.

Potential Energy

Potential energy is energy due to an object's position or condition. A rock on a cliff has potential energy due to its position, while the energy stored in a starch molecule is due to the condition of the bonds between the atoms in that molecule.

Hooke's law describes the relationship between stress and strain in a spring. The amount of force is directly proportional to the compression or extension of the spring. The amount of potential energy depends on the amount of compression or extension and the elasticity of the spring.

Without friction, the work done to lift an object is equal to the object's gain in potential energy. Consider the two equations: *work* = *force* × *distance* and *potential energy* = *mass* × *gravitational acceleration* × *height*. The force needed to lift an object is equivalent to the object's mass multiplied by the acceleration due to gravity. The distance traveled is the height. So in this case, these two equations are equivalent.

If you took a one-kilogram mass to a distance from Earth that corresponds to the distance to the Moon, the mass would have a potential energy relative to Earth of 62,000,000 joules or 62 mega-joules. This is small compared to its potential energy relative to the Sun, which would be 190,000 mega-joules.

Teacher to Teacher

Erin Peters, Lead Science Teacher
Williamsburg Middle School
Arlington, Virginia

"This game will show that you trace every type of energy back to the sun. Pick any activity, for example, "doing your homework," then follow it backward. Pushing your pencil is mechanical energy which comes from the chemical energy of eating lunch, which comes from food, which gets its energy from the Sun."

Erin Peters

Conservation of Energy Changing Forms of Energy

In our common experiences on Earth, energy is neither created nor destroyed, but is often transformed from one form into another. People use these energy transformations to do work. In most energy transformations, heat is produced.

Energy is not recycled in ecosystems like matter is recycled. Much of the energy that flows through ecosystems is transformed to heat. As energy flows from organism to organism, more and more is transformed as heat. This flow of energy can be visually represented as food chains. The Sun supplies energy to plants, which start almost all food chains.

Conversions Between Kinetic and Potential Energy

As an object falls, its gravitational potential energy is converted into kinetic energy. Therefore, if you know the falling object's initial potential energy, you can calculate the velocity it attains just before it hits the ground using the equation $GPE = mgh$. A 0.06 kg tennis ball dropped from a height of 2.9 m starts with 1.7 J of energy. Solving the kinetic energy equation for v gives 7.54 m/s.

The joule is the SI unit of energy and work. It has the units $\text{kg} \cdot \text{m}^2/\text{s}^2$. In work calculations a joule is sometimes called a newton-meter. Since a newton is composed of the units $\text{kg} \cdot \text{m}/\text{s}^2$, multiplying newtons by meters results in $\text{kg} \cdot \text{m}^2/\text{s}^2$, or joules.

The Law of Conservation of Energy

The law of conservation of energy works for most of our calculations, but Einstein suggested that mass could be converted to energy and energy into mass. Einstein's famous equation, $E = mc^2$, shows the relationship between mass and energy and explains the incredible power unleashed by atomic bombs. So the law of conservation of energy should more accurately be called the law of conservation of energy and mass.

A Big Lift

How does this pole vaulter go from standing at the end of a runway to climbing through the air? The answer is energy. During her vault, energy originally stored in her muscles is converted into other forms of energy that enable her to soar.

Science Journal Which takes more energy: walking up stairs, or taking an escalator? Explain your reasoning.

126

Theme Connection

Energy This chapter focuses on different forms of energy and energy conversions. The law of conservation of energy is explained and applied to various systems.

About the Photo

Energy To reach a maximum height, a pole-vaulter must convert as much kinetic energy as possible into potential energy. The bending of the pole transforms kinetic energy into elastic potential energy, then into gravitational potential energy. The vaulting pole is made from carbon fiber and fiberglass composite materials to make it as light as possible, and to minimize the conversion of elastic potential energy into thermal energy as the pole bends.

Start-Up Activities

Energy Conversions

One of the most useful inventions of the nineteenth century was the electric lightbulb. Being able to light up the dark has enabled people to work and play longer. A lightbulb converts electrical energy to heat energy and light, another form of energy. The following lab shows how electrical energy is converted into other forms of energy.

WARNING: Steel wool can become hot—connect to battery only for a brief time.

1. Obtain two D-cell batteries, two non-coated paper clips, tape, metal tongs, and some steel wool. Separate the steel wool into thin strands and straighten the paper clips.
2. Tape the batteries together and then tape one end of each paper clip to the battery terminals.
3. While holding the steel wool with the tongs, briefly complete the circuit by placing the steel wool in contact with both the paper clip ends.
4. **Think Critically** In your Science Journal, describe what happened to the steel wool. What changes did you observe?

FOLDABLES[™] Study Organizer

Energy Make the following Foldable to help you identify what you already know, what you want to know, and what you learned about energy.

- STEP 1** Fold a sheet of paper vertically from side to side. Make the front edge about 1 cm shorter than the back edge.

- STEP 2** Turn lengthwise and fold into thirds.

- STEP 3** Unfold and cut only the top layer along both folds to make three tabs.

- STEP 4** Label each tab as shown.

Question Before you read the chapter, write what you already know about energy under the left tab of your Foldable, and write questions about what you'd like to know under the center tab. After you read the chapter, list what you learned under the right tab.

Purpose Use the Launch Lab to introduce students to the conversion of electricity to light and thermal energy. **L1** **COOP LEARN**

LS Kinesthetic

Materials 2 D-cell batteries, 2 non-coated paper clips, tape, metal tongs, steel wool

Teaching Strategy Inform students that the steel wool can become quite hot.

Think Critically

When connected to the batteries, the steel wool gives off light and thermal energy.

Assessment

Content Have students investigate how a light bulb works and write a paragraph comparing it with the model they made in this activity. Use **Performance Assessment in the Science Classroom**, p. 159.

Reading Guide

What You'll Learn

- **Distinguish** between kinetic and potential energy.
- **Calculate** kinetic energy.
- **Describe** different forms of potential energy.
- **Calculate** gravitational potential energy.

Why It's Important

All of the changes that occur around you every day involve the conversion of energy from one form to another.

Review Vocabulary

gravity: the attractive force between any two objects that have mass

New Vocabulary

- energy
- kinetic energy
- joule
- potential energy
- elastic potential energy
- chemical potential energy
- gravitational potential energy

Section Focus Transparency **They've Got Potential** **Chapter 5**

Here's a tough question—what do these three pictures have in common?

1. What happens between the top and the bottom of a waterfall?
2. How do mosses use moss?
3. What happens as the tennis ball returns to its original shape?

L2

What is energy?

Wherever you are sitting as you read this, changes are taking place—lightbulbs are heating the air around them, the wind might be rustling leaves, or sunlight might be glaring off a nearby window. Even you are changing as you breathe, blink, or shift position in your seat.

Every change that occurs—large or small—involves energy. Imagine a baseball flying through the air. It hits a window, causing the glass to break as shown in **Figure 1**. The window changed from a solid sheet of glass to a number of broken pieces. The moving baseball caused this change—a moving baseball has energy. Even when you comb your hair or walk from one class to another, energy is involved.

Figure 1 The baseball caused changes to occur when it hit the window.

Describe the changes that are occurring.

Energy and Work In science, **energy** is defined as the ability to do work. Work is done when a force causes something to move. The ball in **Figure 1** does work on the window when it exerts a force on the glass and causes it to break. Energy also can be defined as the ability to cause change. When work is done, something moves and a change occurs. When work is done and a change occurs, energy moves from place to place or changes from one form to another.

Figure 1 The window breaks.

Figure 2 Energy is stored in the gasoline and in the food.

Discussion

Storage and Motion Name some objects that store energy and some examples of energy in motion. Possible answers: stored—springs, muscles in our bodies; motion—bouncing ball, spinning top, baseball flying through the air **L1** **LS** Linguistic

✓ Reading Check

Answer thermal energy, chemical energy, radiant energy, and electrical energy

Text Question Answer

Energy stored in food and gasoline is chemical potential energy. Energy from the Sun is in the form of thermal energy and electromagnetic radiation.

Fun Fact

Mitochondria are organelles that convert chemical energy into forms cells can use. This is why they are also known as the powerhouses of living cells.

Figure 2 Energy can be stored and it can move from place to place.

Infer which materials are storing chemical energy.

Different Forms of Energy

Turn on an electric light, and a dark room becomes bright. Turn on your CD player, and sound comes through your headphones.

In both situations, energy moves from one place to another. These changes are different from each other, and differ from the baseball shattering the window in **Figure 1**. This is because energy has several different forms—electrical, chemical, radiant, and thermal.

Figure 2 shows some examples of everyday situations which involve forms of energy. Is the chemical energy stored in food the same as the energy that comes from the Sun or the energy stored in gasoline? Radiant energy from the Sun travels a vast distance through space to Earth, warming the planet and providing energy that enables green plants to grow. When you make toast in the morning, you are using electrical energy. In short, energy plays a role in every activity that you do.

✓ **Reading Check** What are some different forms of energy?

An Energy Analogy Money can be used in an analogy to help you understand energy. If you have \$100, you could store it in a variety of forms—cash in your wallet, a bank account, travelers' checks, or gold or silver coins. You could transfer that money to different forms. You could deposit your cash into a bank account or trade the cash for gold. Regardless of its form, money is money. The same is true for energy. Energy from the Sun that warms you and energy from the food that you eat are only different forms of the same thing.

Differentiated Instruction

English-Language-Learners Have students list ways they can warm up. Possible answers: sit by the fire, sit in the Sun, wrap up in blankets, run in place, rub their hands together. Then have them classify whether they warmed up from kinetic (moving) energy, or by capturing thermal energy.

Science Journal

Different Forms of Energy Have students make a list in their Science Journals of the different types of energy mentioned in the text. Have them list several examples of how they use each form of energy every day. **L2** **LS** Linguistic

Use Science Words

Word Origin Have students look up the words *kinetic* and *potential* in the dictionary. *Kinetic* comes from the Greek root *kinein* (to move) and *potential* from the Latin root *potens* (power). Ask a volunteer to state how the words *kinetic* and *potential* reflect the meanings of their roots. **Possible answer:** Kinetic energy is energy of movement. Potential energy is stored energy due to position, waiting to be unleashed. **L1** **LS** **Linguistic**

Quick Demo

Kinetic Energy

Materials one heavy ball, one light ball, two identical balls and a table top.

Estimated Time five minutes

Procedure

1. Show students two balls; one heavy and one light. Roll them across the table at about the same speed. Ask: Which ball has the greater kinetic energy? **If the velocity of both balls is the same, the ball with the greater mass has the greater kinetic energy.**

2. Show the students two identical balls. Roll the balls across the table but roll one ball faster than the other. Ask: Which ball has the greater kinetic energy? **The ball with the greater speed.** **L1** **LS** **Logical-Mathematical**

Applying Math

Florida: MA.B.1.4.2

Answers to Practice Problems

1. $KE = \frac{1}{2} (0.15 \text{ kg}) (40 \text{ m/s})^2 = 120 \text{ J}$

2. $300,000 \text{ J} = \frac{1}{2} m (20 \text{ m/s})^2$
 $m = 1,500 \text{ kg}$

3. $v^2 = 2 \frac{(4,000 \text{ J})}{(80 \text{ kg})}$
 $v = 10 \text{ m/s}$

Scienceonline

Topic: Glacier Flow

Visit fl.gpscience.com for Web links to information about the speeds at which glaciers flow.

Activity For the five fastest glaciers, calculate the kinetic energy a 1-kg block of ice in each glacier would have.

Kinetic Energy

When you think of energy, you might think of action—or objects in motion—like the baseball that shatters a window. An object in motion does have energy. **Kinetic energy** is the energy a moving object has because of its motion. The kinetic energy of a moving object depends on the object's mass and its speed.

Kinetic Energy Equation

$$\text{kinetic energy (in joules)} = \frac{1}{2} \text{ mass (in kg)} \times [\text{speed (in m/s)}]^2$$

$$KE = \frac{1}{2} m v^2$$

The SI unit of energy is the **joule**, abbreviated J. If you dropped a softball from a height of about 0.5 m, it would have a kinetic energy of about one joule before it hit the floor.

Applying Math

Solve a Simple Equation

KINETIC ENERGY A jogger whose mass is 60 kg is moving at a speed of 3 m/s. What is the jogger's kinetic energy?

IDENTIFY known values and the unknown value

Identify the known values:

a jogger whose mass is 60 kg $\xrightarrow{\text{means}} m = 60 \text{ kg}$

is moving at a speed of 3 m/s $\xrightarrow{\text{means}} v = 3 \text{ m/s}$

Identify the unknown value:

What is the jogger's kinetic energy? $\xrightarrow{\text{means}} KE = ? \text{ J}$

SOLVE the problem

Substitute the known values $m = 60 \text{ kg}$ and $v = 3 \text{ m/s}$ into the kinetic energy equation:

$$KE = \frac{1}{2} mv^2 = \frac{1}{2} (60 \text{ kg}) (3 \text{ m/s})^2 = \frac{1}{2} (60) (9) \text{ kg m}^2/\text{s}^2 = 270 \text{ J}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the kinetic energy you calculate by the square of the given velocity, and then multiplying by 2. The result should be the mass given in the problem.

Practice Problems

1. What is the kinetic energy of a baseball moving at a speed of 40 m/s if the baseball has a mass of 0.15 kg?
2. A car moving at a speed of 20 m/s has a kinetic energy of 300,000 J. What is the car's mass?
3. A sprinter has a mass of 80 kg and a kinetic energy of 4,000 J. What is the sprinter's speed?

Curriculum Connection

Geography On May 18, 1980, Mount St. Helens in the state of Washington erupted in a devastating volcanic explosion. The tremendous energy of the eruption hurled hot ash and rock more than 16 kilometers. Have students do research to discover other geologic events in history that have involved large amounts of energy.

Have each student make a table listing the examples they find and where each event occurred. **Possible events:** earthquakes in 1964 in Alaska, in 1991 in southern California, in 1995 in Kobe, Japan, and in 2001 in India; and eruptions of the volcanoes Krakatau in 1883 and Mount Vesuvius in 79 A.D. **L2** **LS** **Visual-Spatial** **P**

Figure 3 As natural gas burns, it combines with oxygen to form carbon dioxide and water. In this chemical reaction, chemical potential energy is released.

Potential Energy

Energy doesn't have to involve motion. Even motionless objects can have energy. This energy is stored in the object. Therefore, the object has potential to cause change. A hanging apple in a tree has stored energy. When the apple falls to the ground, a change occurs. Because the apple has the ability to cause change, it has energy. The hanging apple has energy because of its position above Earth's surface. Stored energy due to position is called **potential energy**. If the apple stays in the tree, it will keep the stored energy due to its height above the ground. If it falls, that stored energy of position is converted to energy of motion.

Elastic Potential Energy Energy can be stored in other ways, too. If you stretch a rubber band and let it go, it sails across the room. As it flies through the air, it has kinetic energy due to its motion. Where did this kinetic energy come from? Just as the apple hanging in the tree had potential energy, the stretched rubber band had energy stored as elastic potential energy. **Elastic potential energy** is energy stored by something that can stretch or compress, such as a rubber band or spring.

Chemical Potential Energy The cereal you eat for breakfast and the sandwich you eat at lunch also contain stored energy. Gasoline stores energy in the same way as food stores energy—in the chemical bonds between atoms. Energy stored in chemical bonds is **chemical potential energy**. **Figure 3** shows a molecule of natural gas. Energy is stored in the bonds that hold the carbon and hydrogen atoms together and is released when the gas is burned.

Reading Check How is elastic potential energy different from chemical potential energy?

Mini LAB

Interpreting Data from a Slingshot

- Procedure**
1. Using two fingers, carefully stretch a **rubber band** on a table until it has no slack.
 2. Place a **nickel** on the table, slightly touching the mid-point of the rubber band.
 3. Push the nickel back 0.5 cm into the rubber band and release. Measure the distance the nickel travels.
 4. Repeat step 3, each time pushing the nickel back an additional 0.5 cm.

- Analysis**
1. How did the takeoff speed of the nickel seem to change relative to the distance that you stretched the rubber band?
 2. What does this imply about the kinetic energy of the nickel?

Use an Analogy

Saving Money Suggest to students that potential energy is analogous to money in a savings account. The money is not in use now, but it's ready for you to use when needed.

Mini LAB

Purpose Students observe the relationship between the elastic potential energy and kinetic energy of an object. **L1**

COOP LEARN **IS** Kinesthetic

Materials nickel, rubber band, meterstick

Teaching Strategy Have students work in pairs and take turns making the measurements.

Troubleshooting Be sure students don't pull the rubber band back too far. The nickel can quickly travel a long distance.

- Analysis**
1. The farther you stretch the band, the faster the nickel moves.
 2. The greater the speed of the nickel, the greater its kinetic energy.

Assessment

Process Have students predict how their results would differ on a rough surface. Have them test their hypotheses by repeating the activity on sandpaper. Use **Performance Assessment in the Science Classroom**, p. 93.

Reading Check

Answer Elastic potential energy is energy stored by things that stretch or compress. Chemical potential energy is energy stored in chemical bonds.

Visual Learning

Figure 3 What forms of energy are given off when natural gas burns? **light and thermal energy**

INTEGRATE Language Arts

The Myth of Sisyphus Sisyphus had to continually provide the rock with gravitational potential energy only to have it turn into kinetic energy again.

Quick Demo

Gravitational Potential Energy

Materials three tennis balls, bookshelf or something with three different heights to put them on

Estimated Time 5 minutes

Procedure Demonstrate the idea of gravitational potential energy by placing the three tennis balls on level surfaces at different heights. Ask: How do the gravitational potential energies of the three balls compare? *GPE increases with height. The ball that is highest has the greatest GPE and the ball that is nearest the ground has the lowest GPE.* [L1]

IS Logical-Mathematical

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

Answers to Practice Problems

1. $73.5 \text{ J} = (0.15 \text{ kg}) (9.8 \text{ m/s}^2) h$
 $50 \text{ m} = h$

2. $GPE = (0.3 \text{ kg}) (9.8 \text{ m/s}^2) (1 \text{ m})$
 $GPE = 2.94 \text{ J}$

3. $117,600 \text{ J} = m (9.8 \text{ m/s}^2) (200 \text{ m})$
 $60 \text{ kg} = m$

INTEGRATE Language Arts

The Myth of Sisyphus In Greek mythology, a king named Sisyphus angered the gods by attempting to delay death. As punishment, he was doomed for eternity to endlessly roll a huge stone up a hill, only to have it roll back to the bottom again. Explain what caused the potential energy of the stone to change as it moved up and down the hill.

Gravitational Potential Energy Anything that can fall has stored energy called gravitational potential energy. **Gravitational potential energy** (GPE) is energy stored by objects due to their position above Earth's surface. The GPE of an object depends on the object's mass and height above the ground. Gravitational potential energy can be calculated from the following equation.

Gravitational Potential Energy Equation

$$\text{gravitational potential energy (J)} = \text{mass (kg)} \times \text{acceleration due to gravity (m/s}^2\text{)} \times \text{height (m)}$$

$$GPE = mgh$$

On Earth, the acceleration due to gravity is 9.8 m/s^2 and has the symbol g . Like all forms of energy, gravitational potential energy is measured in joules.

Applying Math

Solve a Simple Equation

GRAVITATIONAL POTENTIAL ENERGY What is the gravitational potential energy of a ceiling fan that has a mass of 7 kg and is 4 m above the ground?

IDENTIFY known values and the unknown value

Identify the known values:

has a mass of 7 kg $\Rightarrow m = 7 \text{ kg}$

is 4 m above the ground $\Rightarrow h = 4 \text{ m}$

Identify the unknown value:

what is the gravitational potential energy $\Rightarrow GPE = ? \text{ J}$

SOLVE the problem

Substitute the known values $m = 7 \text{ kg}$, $h = 4 \text{ m}$, and $g = 9.8 \text{ m/s}^2$ into the gravitational potential energy equation:

$$GPE = mgh = (7 \text{ kg})(9.8 \text{ m/s}^2)(4 \text{ m}) = (274) \text{ kg m}^2/\text{s}^2 = 274 \text{ J}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the gravitational potential energy you calculate by the given mass, and then divide by 9.8 m/s^2 . The result should be the height given in the problem.

Practice Problems

- Find the height of a baseball with a mass of 0.15 kg that has a GPE of 73.5 J.
- Find the GPE of a coffee mug with a mass of 0.3 kg on a 1-m high counter top.
- What is the mass of a hiker 200 m above the ground if her GPE is 117,600 J?

For more practice problems go to page 879, and visit Math Practice at fl.gpescience.com.

Cultural Diversity

Working with Energy During World War II, O.S. (Ozzie) Williams became the first African American aeronautical engineer hired by Republic Aviation, Inc. Later, his work included the application of solar and wind energy to the needs of Africa. Have students find other scientists who have spent much of their careers working with energy. Ask students to present their findings in oral reports to the class. [L2] **IS Interpersonal**

Reading Strategy

Graphic Organizer Have students place the word energy in the middle of a sheet of paper. Ask them to list and describe types of energy in a circular fashion around the central word. The final product should resemble the wheel of a bicycle with the energy descriptions arranged as spokes.

Changing GPE Look at the objects in the bookcase in **Figure 4**. Which of these objects has the most gravitational potential energy? According to the equation for gravitational potential energy, the GPE of an object can be increased by increasing its height above the ground. If two objects are at the same height, then the object with the larger mass has more gravitational potential energy.

In **Figure 4**, suppose the green vase on the lower shelf and the blue vase on the upper shelf have the same mass. Then the blue vase on the upper shelf has more gravitational potential energy because it is higher above the ground.

Imagine what would happen if the two vases were to fall. As they fall and begin moving, they have kinetic energy as well as gravitational potential energy. As the vases get closer to the ground, their gravitational potential energy decreases. At the same time, they are moving faster, so their kinetic energy increases. The vase that was higher above the floor has fallen a greater distance. As a result, the vase that initially had more gravitational potential energy will be moving faster and have more kinetic energy when it hits the floor.

Figure 4 An object’s gravitational potential energy increases as its height increases.

Post Reading

Cooperative Project Organize the class into groups of three to four students. Groups will identify everyday examples illustrating kinetic and potential energy, including calculations of each. Groups then will develop creative ways to present their ideas to the class. Encourage groups to consider cartooning, songwriting, or model making.

3 Assess

DAILY INTERVENTION

Check for Understanding
Kinetic Energy Roll a fist-sized piece of soft modeling clay into a ball and drop it on the floor. Ask: Where is the kinetic energy of the clay ball the greatest? What happened to the kinetic energy when the clay ball hit the floor? What other kinds of energy were formed from the kinetic energy of the ball? *The kinetic energy is greatest just before the ball hits the floor. It then turned into sound energy and thermal energy.*

Reteach
Energy Transformation Perform several tasks, such as clapping your hands, walking across the room, tossing a ball across the room, or turning on a light. Ask students to identify the energy transformations that occur during each task. **L1 ELL**
Visual-Spatial

section 1 review

Summary

Energy

- Energy is the ability to cause change.
- Forms of energy include electrical, chemical, thermal, and radiant energy.

Kinetic Energy

- Kinetic energy is the energy a moving object has because of its motion.
- The kinetic energy of a moving object can be calculated from this equation:

$$KE = \frac{1}{2} mv^2$$

Potential Energy

- Potential energy is stored energy due to the position of an object.
- Different forms of potential energy include elastic potential energy, chemical potential energy, and gravitational potential energy.
- Gravitational potential energy can be calculated from this equation:

$$GPE = mgh$$

Self Check

- Explain** whether an object can have kinetic energy and potential energy at the same time.
- Describe** three situations in which the gravitational potential energy of an object changes.
- Explain** how the kinetic energy of a truck could be increased without increasing the truck’s speed.
- Think Critically** The different molecules that make up the air in a room have, on average, the same kinetic energy. How does the speed of the different air molecules depend on their masses?

Applying Math

- Calculate Kinetic Energy** Find the kinetic energy of a ball with a mass of 0.06 kg moving at 50 m/s.
- Use Ratios** A boulder on top of a cliff has potential energy of 8,800 J and twice the mass of a boulder next to it. What is the GPE of the smaller boulder?
- Calculate GPE** An 80-kg diver jumps from a 10-m high platform. What is the gravitational potential energy of the diver halfway down?

More Section Review fl.gpscience.com

SECTION 1 The Nature of Energy 133

section 1 review

- Yes, an object that is moving above Earth’s surface will have kinetic energy and potential energy.
- An object is raised higher, an object falls to a lower height, and the mass of an object above Earth’s surface changes.
- The kinetic energy could be increased by increasing the truck’s mass.
- Molecules with smaller masses will be moving faster.
- $$KE = \frac{1}{2} mv^2$$

$$KE = \frac{1}{2} (0.06 \text{ kg}) (50 \text{ m/s})^2$$

$$KE = 75 \text{ J}$$
- $$\frac{GPE_1}{m_1} = \frac{GPE_2}{m_2}$$

$$\frac{8800 \text{ J}}{2x} = \frac{GPE_2}{x}$$

$$4400 \text{ J} = GPE_2$$
- $$PE = mgh = 80 \text{ kg} \times 9.8 \text{ m/s}^2 \times 5 \text{ m} = 3900 \text{ J}$$

MA.B.1.4.2, MA.C.3.4.1

Assessment

Process Tell students that a 5 kg bowling ball is on a rack 1.5 m above the ground. Have them calculate the GPE of the ball. $5 \text{ kg} \times 9.8 \text{ m/s}^2 \times 1.5 \text{ m} = 73.5 \text{ J}$ Use **Performance Assessment in the Science Classroom**, p. 101.

SECTION 1 The Nature of Energy 133

 Video Lab available for this Lab.

Real-World Problem

Purpose Students observe how the GPE of a falling ball is converted to kinetic energy and elastic potential energy, enabling the ball to bounce. L2

COOP LEARN Kinesthetic

Process Skills observe and infer, predict, compare, recognize cause and effect

Time Required 30 minutes

Procedure

Alternate Materials table tennis ball, book

Safety Precautions Caution students to let the balls drop and not throw them down.

Teaching Strategy Explain that it is only possible to measure the approximate height of the ball's bounce.

Troubleshooting Have students hold a meter stick vertically next to the drop zone and watch closely to estimate bounce heights.

Conclude and Apply

1. Use the formula: $GPE = m \text{ (kg)} \times 9.8 \text{ m/s}^2 \times h \text{ (m)}$.
2. Average height = sum of heights $\div$ number of trials. Answers will vary.
3. The balls don't bounce as high on the box. Some of the kinetic energy the ball has when it hits the box is transferred to the box, causing the box to vibrate. This energy is then unavailable to help propel the ball up.
4. Some balls store more elastic potential energy than others.

Bouncing Balls

What happens when you drop a ball onto a hard, flat surface? It starts with potential energy. It bounces up and down until it finally comes to a rest. Where did the energy go?

Real-World Problem

Why do bouncing balls stop bouncing?

Goals

- **Identify** the forms of energy observed in a bouncing ball.
- **Infer** why the ball stops bouncing.

Materials

tennis ball	masking tape
rubber ball	cardboard box
balance	*shoe box
meterstick	*Alternate materials

Safety Precautions

Procedure

1. **Measure** the mass of the two balls.
2. Have a partner drop one ball from 1 m. Measure how high the ball bounced. Repeat this two more times so you can calculate an average bounce height. Record your values on the data table.
3. Repeat step 2 for the other ball.
4. **Predict** whether the balls would bounce higher or lower if they were dropped onto the cardboard box. Design an experiment to measure how high the balls would bounce off the surface of a cardboard box.

Bounce Height

Type of Ball	Surface	Trial	Height (cm)
Tennis	Floor	1	36
Tennis	Floor	2	34
Tennis	Floor	3	37
Rubber	Floor	1	54
Rubber	Floor	2	56
Rubber	Floor	3	56
Tennis	Box	1	29

Conclude and Apply

1. **Calculate** the gravitational potential energy of each ball before dropping it.
2. **Calculate** the average bounce height for the three trials under each condition. Describe your observations.
3. **Compare** the bounce heights of the balls dropped on a cardboard box with the bounce heights of the balls dropped on the floor. *Hint: Did you observe any movement of the box when the balls bounced?*
4. **Explain** why the balls bounced to different heights, using the concept of elastic potential energy.

Communicating Your Data

Meet with three other lab teams and compare average bounce heights for the tennis ball on the floor. Discuss why your results might differ. **For more help, refer to the Science Skill Handbook.**

Assessment

Process Demonstrate how the bounce height of a ball becomes lower and lower each time it bounces. Have students infer why this happens. *Each time the ball bounces, part of its energy is converted to other forms of energy, such as thermal energy and sound.* Use **Performance Assessment in the Science Classroom**, p. 89.

Communicating Your Data

Students can use a computer graphics program to prepare a display of their activity results. They should be allowed freedom to make their own design, but the picture should clearly show how the balls bounced higher off the floor than off the box.

Conservation of Energy

Reading Guide

What You'll Learn

- **Describe** how energy can be transformed from one form to another.
- **Explain** how the mechanical energy of a system is the sum of the kinetic and potential energy.
- **Discuss** the law of conservation of energy.

Why It's Important

All the energy transformations that occur inside you and around you obey the law of conservation of energy.

Review Vocabulary

friction: a force that opposes the sliding motion of two surfaces that are touching each other

New Vocabulary

- mechanical energy
- law of conservation of energy

1 Motivate

An editable Microsoft® PowerPoint® presentation is available on **Interactive Chalkboard CD-ROM**.

Bellringer

Section Focus Transparencies also are available on the **Interactive Chalkboard CD-ROM**.

L2 **ELL**

Section Focus Transparency **Power Plants** **Chapter 5**

All living things have something in common—they need energy to stay alive. Plants convert energy from the Sun into a form of energy that other living things can use.

How do people obtain energy from plants? Name some other sources of energy that you use.

L2

Reading Preview

Tie to Prior Knowledge

Skateboarding Discuss the various forms of energy involved in skateboarding.

Word Chart Have students set up a three-column chart. In the first column, students should predict the meaning of the new vocabulary words. In the second column, they should record the actual definition found in the text. Finally, students should make a sketch that illustrates the meaning of the word.

Caption Answer

Figure 5 Possible answers: heater, electric stove, iron, hair dryer

Changing Forms of Energy

Unless you were talking about potential energy, you probably wouldn't think of the book on top of a bookshelf as having much to do with energy—until it fell. You'd be more likely to think of energy as race cars roar past, or as your body uses energy from food to help it move, or as the Sun warms your skin on a summer day. These situations involve energy changing from one form to another form.

Transforming Electrical Energy You use many devices every day that convert one form of energy to other forms. For example, you might be reading this page in a room lit by lightbulbs. The lightbulbs transform electrical energy into light so you can see. The warmth you feel around the bulb is evidence that some of that electrical energy is transformed into thermal energy, as illustrated in **Figure 5**. What other devices have you used today that make use of electrical energy? You might have been awakened by an alarm clock, styled your hair, made toast, listened to music, or played a video game. What form or forms of energy is electrical energy converted to in these examples?

Figure 5 A lightbulb is a device that transforms electrical energy into light energy and thermal energy.

Identify other devices that convert electrical energy to thermal energy.

Figure 6 Review the energy conversions at work in an internal combustion engine. Then discuss how a diesel engine works. In a diesel engine, the air in the cylinder is compressed to a high pressure and becomes very hot. When the fuel is sprayed into the cylinder, it ignites in the hot air without the need of a spark plug. What energy conversions take place in a diesel engine? **Chemical potential energy is converted to thermal energy and then to kinetic energy.** [L2]

Logical-Mathematical

Quick Demo

Energy Conversion

Materials rubber “superball”

Estimated Time five minutes

Procedure Demonstrate conversion of gravitational potential energy to kinetic energy and back again by dropping a rubber “superball” from different heights. Point out that the higher the drop, the greater its final velocity and the higher it rebounds. Also, notice the ball never quite bounces to its original height. Ask: Why does the ball not return to its original height each time the ball bounces? **Some of the energy is converted to thermal energy each time the ball hits the floor.**

Text Question Answer

Mechanical energy is the sum of all potential and kinetic energies. As one transforms into another, the mechanical energy remains constant.

When a spark plug fires in an engine, chemical potential energy is converted into thermal energy.

As the hot gases expand, thermal energy is converted into kinetic energy.

Figure 6 In the engine of a car, several energy conversions occur.

Some energy transformations are less obvious because they do not result in visible motion, sound, heat, or light. Every green plant you see converts light energy from the Sun into energy stored in chemical bonds in the plant. If you eat an ear of corn, the chemical potential energy in the corn is transformed into other forms of energy by your body.

Conversions Between Kinetic and Potential Energy

You have experienced many situations that involve conversions between potential and kinetic energy. Systems such as bicycles, roller coasters, and swings can be described in terms of potential and kinetic energy. Even launching a rubber band or using a bow and arrow involves converting potential energy into kinetic energy. To understand the energy conversions that occur, it is helpful to identify the mechanical energy of a system. **Mechanical energy** is the total amount of potential and kinetic energy in a system and can be expressed by this equation.

$$\text{mechanical energy} = \text{potential energy} + \text{kinetic energy}$$

In other words, mechanical energy is energy due to the position and the motion of an object or the objects in a system. What happens to the mechanical energy of an object as potential and kinetic energy are converted into each other?

Differentiated Instruction

Challenge Remind students that work is the transfer of energy, is measured in the same units as energy, and can be calculated using the formula $W = F \times d$. Provide students the following scenario: The kinetic energy of a hockey puck is 20 J as it moves from ice onto the cement

surrounding the rink. By how much is its energy decreased if it stops on the cement? **20 J** If the cement causes a frictional force of 10 N on the puck, how far does it slide? **$-10 \text{ N} \cdot d = -20 \text{ J}$, therefore $d = 2.0 \text{ m}$** What happens to this energy? **It is converted into thermal energy.** [L3] **Mathematical**

Falling Objects Standing under an apple tree can be hazardous. An apple on a tree, like the one in **Figure 7**, has gravitational potential energy due to Earth pulling down on it. The apple does not have kinetic energy while it hangs from the tree. However, the instant the apple comes loose from the tree, it accelerates due to gravity. As it falls, it loses height so its gravitational potential energy decreases. This potential energy is transformed into kinetic energy as the speed of the apple increases.

Look back at the equation for mechanical energy. If the potential energy is being converted into kinetic energy, then the mechanical energy of the apple doesn't change as it falls. The potential energy that the apple loses is gained back as kinetic energy. The form of energy changes, but the total amount of energy remains the same.

Reading Check What happens to the mechanical energy of the apple as it falls from the tree?

Energy Transformations in Projectile Motion Energy transformations also occur during projectile motion when an object moves in a curved path. Look at **Figure 8**. When the ball leaves the bat, it has mostly kinetic energy. As the ball rises, its speed decreases, so its kinetic energy must decrease, too. However, the ball's gravitational potential energy increases as it goes higher. At its highest point, the baseball has the maximum amount of gravitational potential energy. The only kinetic energy it has at this point is due to its forward motion. Then, as the baseball falls, gravitational potential energy decreases while kinetic energy increases as the ball moves faster. However, the mechanical energy of the ball remains constant as it rises and falls.

SECTION 2 Conservation of Energy 137

Figure 7 Objects that can fall have gravitational potential energy.
Apply What objects around you have gravitational potential energy?

Figure 8 Kinetic energy and gravitational potential energy are converted into each other as the ball rises and falls.

Reading Check

Answer Potential energy decreases; kinetic energy increases; total mechanical energy remains constant.

Caption Answer

Figure 7 Any objects that are elevated have GPE.

Teacher FYI

Free Fall Rate If there is no air resistance, then two objects that start falling at the same time from the same height will hit the ground at the same time. The rate of free fall does not depend on mass. But an object with larger mass has more GPE before it falls and has more kinetic energy when it hits the ground.

IDENTIFYING Misconceptions

Pendulum Swing Some students may not realize that when the bob of a pendulum reaches its maximum height, it momentarily stops, and when it is at its lowest part of its swing, its velocity is highest. Sketch a pendulum on the board and use arrows to show movement. Explain that the bob must briefly stop to change directions. Because it has no velocity, it has no kinetic energy at this point.

Reading Strategy

Clarify Text Have students work with a partner to read *Conversions Between Kinetic and Potential Energy*, *The Law of Conservation of Energy*, and *The Human Body—Balancing the Energy Equation*. For each section, have students take turns restating main ideas as partners listen.

Curriculum Connection

History Students have probably heard the tale of Isaac Newton discovering gravity when an apple fell from a tree onto his head. Have students investigate this story to determine if it is a myth or a true occurrence. Have students share their findings with the class. *Newton is purported to have said himself that observing the fall of an apple "occasioned" his "notion of gravitation."* **L3 IS Interpersonal**

Visualizing Energy Transformations

Have students examine the pictures and read the captions. Then ask the following questions.

As the student goes from point A to B, why is her kinetic energy increasing? **because her velocity is increasing**

What force accelerates the student as she goes from point A to the lowest point and slows down the student as she goes from the lowest point to point D? **gravity**

Activity

Model Swings The movement of the swing is similar to the movement of a pendulum. Provide students with a 1-meter piece of string with a large washer tied to the end of it. Ask students to simulate the movement of the swing or a pendulum using the string and washer. Have students experiment to see if the length of the string has any relationship to the time it takes the washer to make one complete period, going from point A on the diagram to point D and back to point A again. Caution students not to swing string and washer strongly or near other students.

Figure 9

A ride on a swing illustrates how kinetic energy changes to potential energy and back to kinetic energy again. The diagram at right shows four stages of the swing's motion. Although it changes from one form to another, the total energy remains the same.

A At the rider's highest point, her potential energy is at a maximum and her kinetic energy is zero.

B As she falls toward the bottom of the path, the rider accelerates and gains kinetic energy. Because the rider is not as high above the ground, her potential energy decreases.

C The rider, rising toward the opposite side, begins to slow down and lose kinetic energy. As she gains height, her potential energy increases.

D At the highest point on this side of the swing, her potential energy again is at a maximum, and her kinetic energy is zero.

138

LAB DEMONSTRATION

Purpose to demonstrate the conservation of mechanical energy

Materials 2 m plastic tubing, 2 ring stands with clamps, marble

Preparation Form a U-shaped tunnel by clamping each end of the tubing to a ring stand. The ends should be at identical heights.

Procedure Hold a marble slightly above one end of the tubing. Have students predict the height the marble will reach on the opposite side. Release and discuss the result. Rearrange the tubing to form various shaped tunnels and repeat the activity.

Expected Outcome There should be a slight loss in mechanical energy.

Assessment

How was the mechanical energy affected as the marble traveled along the tubing? **Air resistance on a marble inside a plastic tube is negligible.** What are possible causes of this? **friction from the tubing**

Energy Transformations in a Swing When you ride on a swing, like the one shown in **Figure 9**, part of the fun is the feeling of almost falling as you drop from the highest point to the lowest point of the swing's path. Think about energy conservation to analyze such a ride.

The ride starts with a push that gets you moving, giving you kinetic energy. As the swing rises, you lose speed but gain height. In energy terms, kinetic energy changes to gravitational potential energy. At the top of your path, potential energy is at its greatest. Then, as the swing accelerates downward, potential energy changes to kinetic energy. At the bottom of each swing, the kinetic energy is at its greatest and the potential energy is at its minimum. As you swing back and forth, energy continually converts from kinetic to potential and back to kinetic. What happens to your mechanical energy as you swing?

The Law of Conservation of Energy

When a ball is thrown into the air or a swing moves back and forth, kinetic and potential energy are constantly changing as the object speeds up and slows down. However, mechanical energy stays constant. Kinetic and potential energy simply change forms and no energy is destroyed.

This is always true. Energy can change from one form to another, but the total amount of energy never changes. Even when energy changes form from electrical to thermal and other energy forms as in the hair dryer shown in **Figure 10**, energy is never destroyed. Another way to say this is that energy is conserved. This principle is recognized as a law of nature. The **law of conservation of energy** states that energy cannot be created or destroyed. On a large scale, this law means that the total amount of energy in the universe does not change.

Reading Check What law states that the total amount of energy never changes?

Conserving Resources You might have heard about energy conservation or been asked to conserve energy. These ideas are related to reducing the demand for electricity and gasoline, which lowers the consumption of energy resources such as coal and fuel oil. The law of conservation of energy, on the other hand, is a universal principle that describes what happens to energy as it is transferred from one object to another or as it is transformed.

Energy and the Food Chain One way energy enters ecosystems is when green plants transform radiant energy from the Sun into chemical potential energy in the form of food. Energy moves through the food chain as animals that eat plants are eaten by other animals. Some energy leaves the food chain, such as when living organisms release thermal energy to the environment. Diagram a simple biological food chain showing energy conservation.

Figure 10 The law of conservation of energy requires that the total amount of energy going into a hair dryer must equal the total amount of energy coming out of the hair dryer.

Energy and the Food Chain In a food chain, arrows show the direction in which energy moves from one organism to the next. Possible food chain: grass → rabbit → fox

Career Find out how environmental scientists in your area use data on numbers and kinds of plants and animals to evaluate the health of an ecosystem.

Use Science Words

Word Meaning The word *conservation* means to keep from being lost or wasted. Discuss why this is an appropriate word to use for the principle of conservation of energy. Possible answer: It is appropriate because energy is never lost. **L2**

Linguistic

Text Question Answer:

Mechanical energy remains constant.

Reading Check

Answer The law of conservation of energy.

Virtual Labs

Energy Conversion How is energy converted from one form to another?

Science Journal

Have students create a flow diagram that traces the conversion of solar energy into different forms of energy on earth. Possible answers: Plants convert solar energy into food for animals who move around. Plants also feed people who use machines and electricity to do work. Thermal energy from the sun causes warm air to rise which causes wind energy, and it fuels the water cycle.

Mini LAB

Purpose Students observe how kinetic energy can change into thermal energy. **L1**

IS Intrapersonal

Materials paper clip

Teaching Strategy Have students use uncoated clips that are not too thick or brittle to easily bend.

Safety Precaution Students should be careful of the sharp ends of the paper clip when bending it.

Analysis

1. It went up. Some mechanical energy from the paper clip was converted to thermal energy.
2. Chemical energy from the body is converted to kinetic energy that is transferred to the paper clip. Mechanical energy is converted to thermal energy by collisions of the molecules in the paper clip.

Assessment

Oral Have students discuss other examples of the process modeled by this activity. **Possible answer:** bicycle or car tires heat up as they roll along the road. Use **Performance Assessment in the Science Classroom**, p. 89.

Caption Answer

Figure 11 Both the kinetic and potential energy decrease as friction and air resistance transform the swing's mechanical energy into thermal energy.

Figure 11 In a swing, mechanical energy is transformed into thermal energy because of friction and air resistance.

Infer how the kinetic and potential energy of the swing change with time.

Mini LAB

Transforming Energy in a Paper Clip

Procedure

1. Straighten a paper clip. While holding the ends, touch the paper clip to the skin just below your lower lip. Note whether the paper clip feels warm, cool, or about room temperature.
2. Quickly bend the paper clip back and forth five times. Touch it below your lower lip again. Note whether the paper clip feels warmer or cooler than before.

Analysis

1. What happened to the temperature of the paper clip? Why?
2. Describe the energy conversions that take place as you bend the paper clip.

Is energy always conserved? You might be able to think of situations where it seems as though energy is not conserved. For example, while coasting along a flat road on a bicycle, you know that you will eventually stop if you don't pedal. If energy is conserved, why wouldn't your kinetic energy stay constant so that you would coast forever? In many situations, it might seem that energy is destroyed or created. Sometimes it is hard to see the law of conservation of energy at work.

The Effect of Friction You know from experience that if you don't continue to pump a swing or be pushed by somebody else, your arcs will become lower and you eventually will stop swinging. In other words, the mechanical (kinetic and potential) energy of the swing seems to decrease, as if the energy were being destroyed. Is this a violation of the law of conservation of energy?

It can't be—it's the law! If the energy of the swing decreases, then the energy of some other object must increase by an equal amount to keep the total amount of energy the same. What could this other object be that experiences an energy increase? To answer this, you need to think about friction. With every movement, the swing's ropes or chains rub on their hooks and air pushes on the rider, as illustrated in **Figure 11**. Friction and air resistance cause some of the mechanical energy of the swing to change to thermal energy. With every pass of the swing, the temperature of the hooks and the air increases a little, so the mechanical energy of the swing is not destroyed. Rather, it is transformed into thermal energy. The total amount of energy always stays the same.

Fun Fact

Many people have tried to develop a perpetual motion machine, a device which, once set in motion, would forever make more energy than it uses. Conservation of energy means that such a machine is impossible.

Differentiated Instruction

Learning Disabled To help students see how friction affects the velocity and therefore the kinetic energy of objects, have them roll marbles across a smooth table and then across a piece of carpet. Explain that the marbles move more slowly on the carpet and have less kinetic energy because the frictional force opposes their motion.

L1 IS Kinesthetic

Converting Mass into Energy You might have wondered how the Sun unleashes enough energy to light and warm Earth from so far away. A special kind of energy conversion—nuclear fusion—takes place in the Sun and other stars. During this process a small amount of mass is transformed into a tremendous amount of energy. An example of a nuclear fusion reaction is shown in **Figure 12**. In the reaction shown here, the nuclei of the hydrogen isotopes deuterium and tritium undergo fusion.

Nuclear Fission Another process involving the nuclei of atoms, called nuclear fission, converts a small amount of mass into enormous quantities of energy. In this process, nuclei do not fuse—they are broken apart, as shown in **Figure 12**. In either process, fusion or fission, mass is converted to energy. In processes involving nuclear fission and fusion, the total amount of energy is still conserved if the energy content of the masses involved are included. Then the total energy before the reaction is equal to the total energy after the reaction, as required by the law of conservation of energy. The process of nuclear fission is used by nuclear power plants to generate electrical energy.

Figure 12 Mass is converted to energy in the processes of fusion and fission.

Nuclear fusion

$$\text{Mass } {}^2_1\text{H} + \text{Mass } {}^3_1\text{H} > \text{Mass He} + \text{Mass neutron}$$

In this fusion reaction, the combined mass of the two hydrogen nuclei is greater than the mass of the helium nucleus, He, and the neutron.

Nuclear fission

$$\text{Mass U} + \text{Mass neutron} > \text{Mass Xe} + \text{Mass Sr} + \text{Mass neutrons}$$

In nuclear fission, the mass of the large nucleus on the left is greater than the combined mass of the other two nuclei and the neutrons.

SECTION 2 Conservation of Energy 141

Scienceonline

Topic: Nuclear Fusion

Visit gpscience.com for Web links to information about using nuclear fusion as a source of energy in electric power plants.

Activity Make a table listing the advantages and disadvantages of using nuclear fusion as an energy source.

Use Science Words

Word Meaning Have students use a dictionary to look up the words *fusion* and *fission*. Ask them to explain why these are appropriate terms for the nuclear processes discussed in this section. **Fusion is combining of things—in nuclear fusion, nuclei combine. Fission is splitting apart of things—in nuclear fission, nuclei split apart.** **L1** **IS** **Linguistic**

Inquiry Lab

Calculate Energy

Purpose to calculate elastic potential energy and kinetic energy in a rubber band

Possible Materials rubber band, Newton scale, meterstick, pan balance, stopwatch.

Estimated Time 30 minutes

Procedure Have students devise a method to calculate and a method to check the elastic potential energy of a rubber band using the materials listed. Remind them that velocity can be calculated using the horizontal distance traveled and the time to fall. Have them graph force needed to pull v. distance pulled, and force needed to pull v. velocity.

Safety Precautions Caution students not to shoot rubber bands at each other.

Teaching Strategy

The elastic potential energy can be calculated by multiplying the force needed to pull times one-half the distance pulled. It should nearly equal the kinetic energy which can be calculated from the mass and velocity. The force v. distance graph should be a straight diagonal line because they are directly proportional. Force v. velocity should also be a straight line.

For additional inquiry activities, see *Science Inquiry Lab*.

Cultural Diversity

Energy in Martial Arts Karate, which means “empty hand,” originated on Okinawa in the seventeenth century. A trained karateka can break a thin concrete block with his or her hand. Have students research the meanings of the names of other forms of martial arts and where they originated. **Possible martial arts include judo, aikido, and taekwon do.** **L2** **IS** **Intrapersonal**

Teacher FYI

Chain Reaction In the process of fission, neutrons are released. They initiate further fission, beginning a chain reaction. For the chain reaction to continue, sufficient fissionable material must be present. The amount of material needed to sustain a chain reaction is known as the critical mass.

IDENTIFYING Misconceptions

Human Conversions Students may confuse energy transformations with changes in matter. Some may state that food is converted into energy in the body. During digestion, chemical compounds in food are converted into compounds that muscle cells use to enable muscles to move.

Use Science Words

Word Origin The word *calorie* originates from the eighteenth-century word *caloric*, which was a hypothetical weightless fluid that scientists thought flowed from hot objects to cold objects. Ask students to find out how caloric theory contributed to the idea of conservation of energy. Benjamin Thompson (1753–1814), working in a German munitions factory noticed that canons became very hot during the boring process even though the canon and the borer were initially cold. He concluded that heat was a form of energy produced by friction. Similar experiments by other scientists confirmed that heat was a form of energy and not a fluid, and that it was energy that was being conserved and not caloric. **L2** **IS** **Linguistic**

Caption Answer

Figure 13 7 to 8 hours depending on body type

Content Background

Students may be familiar with the phrase “counting calories” as a synonym for dieting. Counting calories is a way to monitor the amount of energy being consumed in food in hopes of forcing the body to use up its energy reserves stored as unwanted fat.

The Human Body—Balancing the Energy Equation

What forms of energy discussed in this chapter can you find in the human body? With your right hand, reach up and feel your left shoulder. With that simple action, stored potential energy within your body was converted to the kinetic energy of your moving arm. Did your shoulder feel warm to your hand? Some of the chemical potential energy stored in your body is used to maintain a nearly constant internal temperature. A portion of this energy also is converted to the excess heat that your body gives off to its surroundings. Even the people shown standing in **Figure 13** require energy conversions to stand still.

Energy Conversions in Your Body The complex chemical and physical processes going on in your body also obey the law of conservation of energy. Your body stores energy in the form of fat and other chemical compounds. This chemical potential energy is used to fuel the processes that keep you alive, such as making your heart beat and digesting the food you eat. Your body also converts this energy to heat that is transferred to your surroundings, and you use this energy to make your body move. **Table 1** shows the amount of energy used in doing various activities. To maintain a healthy weight, you must have a proper balance between energy contained in the food you eat and the energy your body uses.

Figure 13 The runners convert the energy stored in their bodies more rapidly than the spectators do. **Calculate** Use **Table 1** to calculate how long a person would need to stand to burn as much energy as a runner burns in 1 h.

Visual Learning

Table 1 Have students think back over the past 24 hours and make a list of the things they did. Have them use the table to find out about how many Calories of energy they used.

Active Reading

Learning Journal Have students draw a vertical line down each page of a Learning Journal and record research notes, lecture notes, or vocabulary terms in the left column. In the right column, they respond to, interpret, question, or analyze the left column entries. Students can write a Learning Journal while reading about conservation of energy.

Food Energy

Your body has been busy

breaking down your breakfast into molecules that can be used as fuel. The chemical potential energy in these molecules supplies the cells in your body with the energy they need to function. Your body also can use the chemical potential energy stored in fat for its energy needs. The food Calorie (C) is a unit used by nutritionists to measure how much energy you get from various foods—1 C is equivalent to about 4,184 J. Every gram of fat a person consumes can supply 9 C of energy. Carbohydrates and proteins each supply about 4 C of energy per gram.

Look at the labels on food packages. They provide information about the Calories contained in a serving, as well as the amounts of protein, fat, and carbohydrates.

Table 1 Calories Used in One Hour

Type of Activity	Body Frames		
	Small	Medium	Large
Sleeping	48	56	64
Sitting	72	84	96
Eating	84	98	112
Standing	96	112	123
Walking	180	210	240
Playing tennis	380	420	460
Bicycling (fast)	500	600	700
Running	700	850	1,000

Section 2 Review

Summary

Energy Transformations

- Energy can be transformed from one form to another.
- Devices such as lightbulbs, hair dryers, and automobile engines convert one form of energy into other forms.
- The mechanical energy of a system is the sum of the kinetic and potential energy in the system:

$$\text{mechanical energy} = KE + PE$$

- In falling, projectile motion, and swings, kinetic and potential energy are transformed into each other and the mechanical energy doesn't change.

The Law of Conservation of Energy

- According to the law of conservation of energy, energy cannot be created or destroyed.
- Friction converts mechanical energy into thermal energy.
- Fission and fusion are nuclear reactions that convert a small amount of mass in a nucleus into an enormous amount of energy.

Self Check

- Explain** how friction affects the mechanical energy of a system.
- Describe** the energy transformations that occur as you coast down a long hill on a bicycle and apply the brakes, causing the brake pads and bicycle rims to feel warm.
- Explain** how energy is conserved when nuclear fission or fusion occurs.
- Think Critically** A roller coaster is at the top of a hill and rolls to the top of a lower hill. If mechanical energy is conserved, on the top of which hill is the kinetic energy of the roller coaster larger?

Applying Math

- Calculate Kinetic Energy** The potential energy of a swing is 200 J at its highest point and 50 J at its lowest point. If mechanical energy is conserved, what is the kinetic energy of the swing at its lowest point?
- Calculate Thermal Energy** The mechanical energy of a bicycle at the top of a hill is 6,000 J. The bicycle stops at the bottom of the hill by applying the brakes. If the potential energy of the bicycle is 2,000 J at the bottom of the hill, how much thermal energy was produced?

Section 2 Review

- Friction converts mechanical energy into thermal energy.
- As you coast down the hill, some of your potential energy is being transformed into kinetic energy. When you apply the brakes, friction between the brake pads and the bicycle rims convert kinetic energy into thermal energy.
- A small amount of mass is converted into energy.
- The top of the lower hill; the roller coaster has less potential energy at the top of the lower hill. The difference between the roller coaster's potential energy at the top of the higher hill and lower hill has been converted into kinetic energy.
- 150 J
- 4,000 J

Post Reading

Science Journal Compose a written response to the following prompt: Imagine you are pushing a young child on a swing. Describe the role played by the concepts of energy transformation and the law of conservation of energy.

3 Assess

DAILY INTERVENTION

Check for Understanding

Fission v. Fusion Have students use models to demonstrate nuclear fission and nuclear fusion. Students could use marbles for neutrons and protons, with clay to hold them together.

L2 **IS** Visual-Spatial

Reteach

Energy and Calories Show students pictures of people performing various activities, such as those listed in Table 1. Ask students to order the pictures according to how quickly they burn calories. Students should also identify types of energy conversion in each activity.

L1 **IS** Visual-Spatial

Assessment

Process Have students draw diagrams illustrating some of the changing forms of energy involved in bouncing a basketball. Chemical energy from the body changes to kinetic energy to lift the ball. This energy is transferred to the ball as potential energy. As the ball falls, this changes to kinetic energy. As the ball hits the floor, part of the energy changes to sound, part is transferred to the floor, and most is returned to the ball as elastic potential energy, enabling the ball to bounce. Use PASC, p. 127.

Real-World Problem

Purpose Construct a pendulum to compare the exchange of potential and kinetic energy. **L2**

COOP LEARN **IS** Kinesthetic

Process Skills measure, collect and organize data, observe and infer, communicate, make and use tables, compare and contrast, recognize cause and effect, form a hypothesis, design an experiment, use numbers, separate and control variables

Time Required one class period

Possible Materials Have additional materials available (string, extra ring stands, banner paper, masking tape).

Safety Precautions Students should wear safety goggles when swinging the stoppers.

Form a Hypothesis

Possible Hypothesis Students may suggest that the crossarm's interference halfway up the length of the string will cause the maximum height to decrease by one half. In fact, the shape of the pendulum's path will change, but the height on the opposite end should still be close to the original height.

Swinging Energy

Real-World Problem

Imagine yourself swinging on a swing. What would happen if a friend grabbed the swing's chains as you passed the lowest point? Would you come to a complete stop or continue rising to your previous maximum height? How does the motion and maximum height reached by a swing change if the swing is interrupted?

Form a Hypothesis

Examine the diagram on this page. How is it similar to the situation in the introductory paragraph? An object that is suspended so that it can swing back and forth is called a pendulum. Hypothesize what will happen to the pendulum's motion and final height if its swing is interrupted.

Goals

■ **Construct** a pendulum to compare the exchange of potential and kinetic energy when a swing is interrupted.

■ **Measure** the starting and ending heights of the pendulum.

Possible Materials

ring stand
test-tube clamp
support-rod clamp, right angle
30-cm support rod
2-hole, medium rubber stopper
string (1 m)
metersticks (2)
graph paper

Safety Precautions

WARNING: Be sure the base is heavy enough or well anchored so that the apparatus will not tip over.

Alternative Inquiry Lab

Energy Loss Have students determine the thermal energy produced by friction after the pendulum has swung 10 times. Have them measure the mass of the stopper, calculate its initial potential energy using its initial height, and calculate its ending potential energy using the height after 10 swings.

The difference is the amount of initial potential energy that has been converted into thermal energy by friction. Have them do this exercise both with and without cross-arm interference.

L3 **IS** Kinesthetic

Using Scientific Methods

Test Your Hypothesis

Make a Plan

1. As a group, write your hypothesis and list the steps that you will take to test it. Be specific. Also list the materials you will need.
2. **Design** a data table and place it in your Science Journal.
3. Set up an apparatus similar to the one shown in the diagram.
4. **Devise** a way to measure the starting and ending heights of the stopper. Record your starting and ending heights in a data table. This will be your control.
5. **Decide** how to release the stopper from the same height each time.
6. Be sure you test your swing, starting it above and below the height of the cross arm. How many times should you repeat each starting point?

Follow Your Plan

1. Make sure your teacher approves your plan before you start.
2. Carry out the approved experiment as planned.
3. While the experiment is going on, write any observations that you make and complete the data table in your Science Journal.

Analyze Your Data

1. When the stopper is released from the same height as the cross arm, is the ending height of the stopper exactly the same as its starting height? Use your data to support your answer.
2. **Analyze** the energy transfers. At what point along a single swing does the stopper have the greatest kinetic energy? The greatest potential energy?

Conclude and Apply

1. **Explain** Do the results support your hypothesis?
2. **Compare** the starting heights to the ending heights of the stopper. Is there a pattern? Can you account for the observed behavior?
3. **Discuss** Do your results support the law of conservation of energy? Why or why not?
4. **Infer** What happens if the mass of the stopper is increased? Test it.

Communicating Your Data

Compare your conclusions with those of the other lab teams in your class. For more help, refer to the **Science Skill Handbook**.

LAB 145

Assessment

Process When started from the same height, a pendulum without interference from a crossarm will remain in motion longer than a pendulum with an arm. Ask students to discuss and explain this. **Some energy is transferred to the crossarm.** Use **Performance Assessment in the Science Classroom**, p. 89. **L2 IS Interpersonal**

Communicating Your Data

Have students use a word processing program to write a short description of their experiment. They may wish to use a computer graphics program to make sketches that help explain the results.

Test Your Hypothesis

Possible Procedures Set up the pendulum and start it moving. Measure the height at which the stopper was released to start the pendulum. When the pendulum is on the far side of its swing, insert the crossarm. Measure the height to which the pendulum swings after it hits the crossarm.

Teaching Strategy Tape white paper to a wall behind the pendulum for marking stopper height.

Troubleshooting The swing of the pendulum will be irregular if the crossarm inhibits movement of only one side of the pendulum's swing. Suggest students find a way to have the cross arm limit swing in both directions.

Expected Outcome Students will observe that even with the crossarm, the approximate original height is reached.

Analyze Your Data

1. no
2. Kinetic is greatest at the bottom; potential is greatest at the top.

Conclude and Apply

1. Answers will vary with results.
2. Ending heights are lower. Friction slows the stopper and removes some energy from the system.
3. Yes; the apparent loss of energy is due to friction.
4. Kinetic and potential energy increase; the person must pull harder to stop the swing.

Content Background

The construction of a perpetual motion machine has been the dream of inventors for centuries. However, the first and second laws of thermodynamics make this impossible. In any real machine, friction causes some of the machine's mechanical energy to be converted to thermal energy that cannot be recovered. As a result, the first law of thermodynamics requires that energy be continually supplied to any machine to keep it moving.

Discussion

Thermodynamics What are the two laws of energy that make perpetual motion machines impossible? **1st Law:** Energy cannot be created or destroyed; it only changes form. **2nd Law:** Thermal energy flows only from hot to cold.

Historical Significance

Perpetual motion machines have been around at least since Villand de Honnecourt made drawings of one in the 13th century. Between 1635 and 1903, 600 patents were granted for purported free-energy machines. One inventor fooled scientists with a machine that appeared to run on water. He raised five million dollars from investors who later learned that it was actually based on hidden air tubes. In spite of the massive fraud that was found, there are still believers in his "technology" today.

The Impossible Dream

**A machine that keeps on going?
It has been tried for hundreds of years.**

Many people have tried throughout history—and failed—to build perpetual-motion machines. In theory, a perpetual-motion machine would run forever and do work without a continual source of energy. You can think of it as a car that you could fill up once with gas, and the car would run forever. Sound impossible? It is!

Science Puts Its Foot Down

For hundreds of years, people have tried to create perpetual-motion machines. But these machines won't work because they violate two of nature's laws. The first law is the law of conservation of energy, which states that energy cannot be created or destroyed. It can change form—say,

from mechanical energy to electrical energy—but you always end up with the same amount of energy that you started with.

How does that apply to perpetual-motion machines? When a machine does work on an object, the machine transfers energy to the object.

Unless that machine gets more energy from somewhere else, it can't keep doing work. If it did, it would be creating energy.

The second law states that heat by itself always flows from a warm object to a cold object. Heat will only flow from a cold object to a warm object if work is done. In the process, some heat always escapes.

To make up for these energy losses, energy constantly needs to be transferred to the machine. Otherwise, it stops. No perpetual motion. No free electricity. No devices that generate more energy than they use. No engine motors that run forever without refueling. Some laws just can't be broken.

Visitors look at the Keely Motor, the most famous perpetual-motion machine fraud of the late 1800s.

Analyze Using your school or public-library resources, locate a picture or diagram of a perpetual-motion machine. Figure out why it won't run forever. Explain to the class what the problem is.

TIME

For more information, visit
fl.gpscience.com

Analyze Ask students to think about how perpetual motion machines might be helpful to science and technology if the laws of thermodynamics did not exist. Start a dialogue addressing the thousands of scam artists who have tried in vain to sell their perpetual motion machines.

Resources for Teachers and Students

"Exploiting Zero-Point Energy", by Philip Yam, *Scientific American*, December 1997

Perpetual Motion: The History of An Obsession, by Arthur W.J.G. OrdHume, Barnes and Noble Books, 1998

Reviewing Main Ideas

Section 1 The Nature of Energy

1. Energy is the ability to cause change.
2. Energy can have different forms, including kinetic, potential, and thermal energy.

3. Moving objects have kinetic energy that depends on the object's mass and velocity, and can be calculated from this equation:

$$KE = \frac{1}{2} mv^2$$

4. Potential energy is stored energy. An object can have gravitational potential energy that depends on its mass and its height, and is given by this equation:

$$GPE = mgh$$

Section 2 Conservation of Energy

1. Energy can change from one form to another. Devices you use every day transform one form of energy into other forms that are more useful.
2. Falling, swinging, and projectile motion all involve transformations between kinetic energy and gravitational potential energy.
3. The total amount of kinetic energy and gravitational potential energy in a system is the mechanical energy of the system:

$$\text{mechanical energy} = KE + GPE$$
4. The law of conservation of energy states that energy never can be created or destroyed. The total amount of energy in the universe is constant.

5. Friction converts mechanical energy into thermal energy, causing the mechanical energy of a system to decrease.
6. Mass is converted into energy in nuclear fission and fusion reactions. Fusion and fission occur in the nuclei of certain atoms, and release tremendous amounts of energy.

FOLDABLES Use the Foldable you made at the beginning of this chapter to review what you learned about energy.

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment

Assessment Transparency Energy Chapter 5				
Directions: Carefully review the table and answer the following questions.				
Person	Calories consumed	Activity	Length of activity	Calories burned
1	400	Watching TV	2 h	150
2	200	Walking	1 h	180
3	1 000	Running	1/2 h	350
4	450	Playing tennis	1 h	460

1. What principle is probably being tested in the above experiment?
A speed
B nuclear fusion
C energy conversion
D gravitational potential energy

2. Students conducted an experiment to find which form of exercise burned the most Calories. They collected data from the experiment into the table above. The experiment could be improved by
I having the same person do each activity for the same amount of time
G recording the time of day each activity was performed
H recording the air temperature during each activity
J calculating person 2's rate of speed

3. Which person burned more Calories than consumed?
A person 1
B person 2
C person 3
D person 4

FOLDABLES Have students use their Foldables to review the content of the chapter. On the back of the paper, have students write a paragraph about what they learned about energy.

Using Vocabulary

1. mechanical energy
2. elastic potential energy
3. joule
4. potential energy
5. kinetic energy
6. law of conservation of energy

Checking Concepts

7. D
8. B
9. B
10. A
11. D
12. C

Interpreting Graphics

13. See student page.
14. height = 0.50 m, GPE = 0.24 J, KE = 0.24 J; height = 0.75 m, GPE = 0.37 J, KE = 0.37 J; height = 1.0 m, GPE = 0.49 J, KE = 0.49 J; The GPE and KE are equal.
15. four times, from 400 J to 1,600 J
16. 2,400 J. It will be four times greater than the KE at 25 m/s, which is 600 J.
17. 100 J. It is one fourth the KE at 20 m/s.

Using Vocabulary

chemical potential energy p. 131	joule p. 130
elastic potential energy p. 131	kinetic energy p. 130
energy p. 128	law of conservation of energy p. 139
gravitational potential energy p. 132	mechanical energy p. 136
	potential energy p. 131

Complete each statement using a word(s) from the vocabulary list above.

1. If friction can be ignored, the _____ of a system doesn't change.
2. The energy stored in a compressed spring is _____.
3. The _____ is the SI unit for energy.
4. When a book is moved from a higher shelf to a lower shelf, its _____ changes.
5. The muscles of a runner transform chemical potential energy into _____.
6. According to the _____, the amount of energy in the universe doesn't change.

Checking Concepts

Choose the word or phrase that best answers the question.

7. What occurs when energy is transferred from one object to another?
 - A) an explosion
 - B) a chemical reaction
 - C) nuclear fusion
 - D) a change
8. For which of the following is kinetic energy converted into potential energy?
 - A) a boulder rolls down a hill
 - B) a ball is thrown upward
 - C) a swing comes to a stop
 - D) a bowling ball rolls horizontally

9. The gravitational potential energy of an object changes when which of the following changes?
 - A) the object's speed
 - B) the object's mass
 - C) the object's temperature
 - D) the object's length
10. Friction causes mechanical energy to be transformed into which of these forms?
 - A) thermal
 - B) nuclear
 - C) kinetic
 - D) potential
11. The kinetic energy of an object changes when which of the following changes?
 - A) the object's chemical potential energy
 - B) the object's volume
 - C) the object's direction of motion
 - D) the object's speed
12. When an energy transformation occurs, which of the following is true?
 - A) Mechanical energy doesn't change.
 - B) Mechanical energy is lost.
 - C) The total energy doesn't change.
 - D) Mass is converted into energy.

Interpreting Graphics

13. Copy and complete the following concept map on energy.

Use the ExamView® Pro Testmaker CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

Use the table below to answer question 14.

Toy Cars Rolling Down Ramps

Ramp Height (m)	Speed at Bottom (m/s)	GPE (J)	KE (J)
0.50	3.13	0.24	0.24
0.75	3.83	0.37	0.37
1.00	4.43	0.49	0.49

- 14. Make and Use Tables** Three toy cars, each with a mass of 0.05 kg, roll down ramps with different heights. The height of each ramp and the speed of each car at the bottom of each ramp is given in the table. Copy and complete the table by calculating the GPE of each car at the top of the ramp and the KE for each car at the bottom of the ramp to two decimal places. How do the values of GPE and KE you calculate compare?

Use the graph below to answer questions 15–17.

Kinetic Energy of Car

- 15.** When the car's speed doubles from 20 m/s to 40 m/s, by how many times does the car's kinetic energy increase?

- 16.** Using the graph, estimate the car's kinetic energy at a speed of 50 m/s.
- 17.** If the car's kinetic energy at a speed of 20 m/s is 400 kJ, what is the car's kinetic energy at a speed of 10 m/s?

Thinking Critically

- 18. Describe** the energy changes that occur in a swing. Explain how energy is conserved as the swing slows down and stops.
- 19. Explain** why the law of conservation of energy must also include changes in mass.
- 20. Infer** why the tires of a car get hot when the car is driven.
- 21. Diagram** On a cold day you rub your hands together to make them warm. Diagram the energy transformations that occur, starting with the chemical potential energy stored in your muscles.

Applying Math

- 22. Calculate Kinetic Energy** What is the kinetic energy of a 0.06-kg tennis ball traveling at a speed of 150 m/s?
- 23. Calculate Potential Energy** A boulder with a mass of 2,500 kg rests on a ledge 200 m above the ground. What is the boulder's potential energy?
- 24. Calculate Mechanical Energy** What is the mechanical energy of a 500-kg roller-coaster car moving with a speed of 3 m/s at the top of hill that is 30 m high?
- 25. Calculate Speed** A boulder with a mass of 2,500 kg on a ledge 200 m above the ground falls. If the boulder's mechanical energy is conserved, what is the speed of the boulder just before it hits the ground?

Thinking Critically

- 18.** At the highest point of the swing, the potential energy is a maximum and the kinetic energy is zero. As the swing falls, potential energy is converted into kinetic energy. At the bottom of the swing, the kinetic energy is maximum and the potential energy is a minimum. As the swing moves, friction and air resistance convert the swing's mechanical energy to thermal energy, causing it to slow down and stop.
- 19.** In nuclear fission and nuclear fusion, a small amount of mass is converted into energy.
- 20.** The flexing of the tires as the car is moving converts elastic potential energy in the tire to thermal energy.
- 21.** Diagram should be: chemical potential energy → kinetic energy of hands → thermal energy.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2, MA.D.2.4.1

22. 1,350 J

23. 4,900,000 J

24. $KE = 2,250 \text{ J}$, $GPE = 147,000 \text{ J}$,
mechanical energy = 149,250 J

25. $KE = 4,900,000 \text{ J}$, $v = 62.6 \text{ m/s}$

Gridded Response

7. 49.5

Short Response

8. The ball's total mechanical energy remains constant. Its value depends on the energy given to it by the batter.
9. Mass changes to energy in nuclear reactions.

Record your answers on the answer sheet provided by your teacher or on a sheet of paper.
The assessed Florida Benchmark appears above the question.

Multiple Choice

1. What is the potential energy of a 5.0-kg object located 2.0 m above the ground?
- A. 2.5 J
B. 10 J
C. 98 J
D. 196 J

Use the figure below to answer questions 2–4.

2. According to the graph, which of the following is the best estimate for the kinetic energy of the rock after it has fallen for 1 s?
- A. 100 J
B. 50 J
C. 200 J
D. 0 J

3. According to the graph, which of the following is the best estimate for the potential energy of the rock before it fell?
- A. 400 J
B. 750 J
C. 200 J
D. 0 J
4. If the rock has a mass of 1 kg, which of the following is the speed of the rock after it has fallen for 2 s?
- A. 10 m/s
B. 100 m/s
C. 20 m/s
D. 200 m/s

Use the figure below to answer questions 5 and 6.

5. At its highest point, the pendulum is 1.2 m above the ground and has a gravitational potential energy of 62 J. If the gravitational potential energy is 10 J at its lowest point, what is the pendulum's kinetic energy at this point?
- A. 0 J
B. 31 J
C. 62 J
D. 52 J

Extended Response

Extended Response

10. **Part A** An atom of uranium combines with a neutron. The uranium breaks apart into a xenon atom, a strontium atom, and two neutrons. Radiant energy is released during

the process. The original mass of the neutron and the uranium atom is greater than the mass of the xenon atom, the mass of the strontium atom, and the masses of the two neutrons. The remaining mass is converted to energy.

Part B It is less. Some of the mass of the particles before the reaction is converted into energy during the reaction.

6. What is the mass of the pendulum bob?

- A. 2.7 kg
- B. 5.3 kg
- C. 6.3 kg
- D. 52 kg

Gridded Response

7. What is the difference, in J, in the gravitational potential energy of a 7.75 kg book that is 1.50 m above the ground and a 9.53 kg book that is 1.75 m above the ground?

Short Response

Use the figure below to answer question 8.

8. How does the mechanical energy of the ball change from the moment just after the batter hits it to the moment just before it touches the ground?

9. Explain why the law of conservation of energy also includes mass when applied to nuclear reactions.

Extended Response

Use the figure below to answer question 10.

SC.1.A.2

10. The figure shows a nuclear reaction.

Part A Describe the process and explain how it obeys the law of conservation of energy.

Part B Describe how the total mass of the particles before the reaction occurs compares to the total mass of the particles produced by the reaction.

SC.1.A.2

11. Describe a process in which energy travels through the environment and changes from one form to another.

Test-Taking Tip

Show All your Work For extended response questions, show all your work and any calculations on your answer sheet.

Question 10 On your answer sheet, list the energy changes that occur during each step.

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubrics on p. 9T.

11. Possible answer: Radiant energy from the Sun travels to Earth and is absorbed by plants. The plants store this as chemical potential energy. An animal eats the plant and gains energy from it. The animal uses part of the energy for

everyday activity and stores part of the energy as chemical potential energy in its body.

Section Focus

Section Focus Transparency **Onward and Upward** **Chapter 6**

Backpacking is a lot of fun, but it also can be a lot of work. Whether hoisting the pack onto your back to start the hike or trudging up a long hill, you'll need to exert a good deal of effort to get to the next camp.

1. Compare the effort exerted by a backpacker moving over level ground to that exerted by a backpacker moving uphill.
2. How do you think the weight of the backpack affects the amount of force needed to move it?

L2

Section Focus Transparency **A Quiet Glide** **Chapter 6**

For some people, paddling a canoe is a pleasant diversion. For others, it's work. Out on a lake, the paddle is a big help in moving the canoe. It might even make work fun!

1. How is a person paddling a canoe doing work?
2. If the paddle broke, would it be easier or more difficult to move the canoe? Explain.
3. How does the shape of the canoe make paddling easier?

L2

Section Focus Transparency **Moving Day** **Chapter 6**

Moving can be a chore. Packing boxes, moving them, then unpacking everything can be hard work. But machines can help. Some machines are simple, while others can be very complicated. This mover uses a section of machines to help make moving day much easier.

What do you see in this picture that makes it easier for the mover to do work?

How do the ramp and dolly make moving easier?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Teaching Transparency **Simple Machines** **Chapter 6**

L2

Teaching

Assessment Transparency **Work and Machines** **Chapter 6**

Directions: Carefully review the data in the table below.

Position	Input distance	Output distance	Effort force
A	1 m	2 m	10 N
B	2 m	1 m	20 N
C	3 m	1.5 m	15 N
D	4 m	2 m	10 N

1. According to this diagram and the table, which variable is being changed?
 - A. The fulcrum
 - B. The input distance
 - C. The output force
 - D. The output distance
2. If the data in the table remains the same, what input force is required to move the mass which is output distance is 2 m?
 - A. 2.5 N
 - B. 5 N
 - C. 10 N
 - D. 20 N
3. Which hypothesis is most likely tested by collecting these data?
 - A. The input force decreases as the input distance decreases.
 - B. The input force increases as the input distance decreases.
 - C. The input force decreases as the output distance decreases.
 - D. The input force increases as the output distance decreases.

L2

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Hands-on Activities

Student Text Lab Worksheet

LAB Levers

Lab Purpose: To investigate the properties of levers.

Directions: Read the directions carefully and follow the steps.

1. Draw a diagram of a lever in the space provided.
2. Label the fulcrum, input arm, and output arm.

Goal: To understand the properties of levers.

Materials: A ruler, a fulcrum, a weight, and a string.

Procedure: Measure the length of the ruler. Place the fulcrum in the center. Hang the weight from the input arm. Measure the input distance and the output distance. Record the input force and the output force.

L2

Laboratory Activities

Laboratory Activity **Balanced Levers**

Directions: Read the directions carefully and follow the steps.

1. Draw a diagram of a lever in the space provided.
2. Label the fulcrum, input arm, and output arm.

Goal: To understand the properties of levers.

Materials: A ruler, a fulcrum, a weight, and a string.

Procedure: Measure the length of the ruler. Place the fulcrum in the center. Hang the weight from the input arm. Measure the input distance and the output distance. Record the input force and the output force.

L2

Enrichment

Name _____	Date _____	Page _____
 Calculating Work		

Directions: Color the following problems.		
1. A team of gliders (250 lb) is pushed up an incline that is 400 ft long. A force of 275 lb is required to push it to the top of the incline.		
a. What is the work done by the team?		
b. How much more distance 1 lb of mass is lifted? Explain.		
c. With a one-third ton load, how long would it take to push it to the top?		
d. Which method is falling apart? Is it even better to raise?		
2. How much power is generated? A person applied 100 lb of force to move a wheelbarrow that is 40 ft.		
a. We could get into engines and a 100 watt electric motor could do it. Is it worth it? What engine can do the most better? Explain.		
3. In 1870, a 40 ft vertical, 100 lb of power in the horsepower (1000 ft-lb) was used to move the average horse and a 100 ft-lb engine.		
a. If a car engine is rated at 125 horsepower, how many 1000 ft-lb power does it produce?		
b. To run a new engine, a car is a horsepower. How many watts? Is it even better?		

L3

Reading Essentials

Work and Machines

section • Work

What You'll Learn

- how to calculate work
- how work and energy are related
- how to calculate efficiency
- how to calculate power

Section Objectives

Selective Understanding
You should be able to explain the following:

1. Identify your text.
You know what you're looking for in a text!

2. Before You Read

Name two things in your life that require more *hammer* than *knocking* in metal nails that only go in *pinholes*.

3. What to Learn

What is Work?

Have you ever done any *work* today? When people talk about work, they might mean doing a job, carrying money, or using a computer. But in scientific terms, the definition of *work* is different. It's the transfer of energy that occurs when a force moves an object.

How do you know if you are doing work?

Press your hand onto the surface of a soap dish as hard as you can. Are you doing work? No. Because you aren't moving the dish, so there's no force to move it. In order to *do* work, you must make the dish move some force. If you push up on the dish and nothing moves, then you haven't done any work.

What does motion have to do with work?

A car is not moving to the center in an off-act, but its *engine* keeps it from falling. One is that a force must be applied to make the object move. The car is not in that it doesn't stop moving, it is the *acceleration* of the applied force.

When you push your finger against the books, you are doing work. Your finger is applying a force against the books, and the books move in the direction of your finger. But it would be hard to keep the same force applied, using different *weight* and *weight* on the ground. You are still doing an upward force to keep the books from falling, but not a force of *weight* or *weight* in that direction, so work is being done.

4. After You Read

What is the difference between *work* and *energy*? How are they related?

5. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

6. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

7. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

8. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

9. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

10. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

11. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

12. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

13. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

14. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

15. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

16. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

17. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

18. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

19. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

20. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

21. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

22. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

23. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

24. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

25. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

26. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

27. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

28. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

29. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

30. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

31. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

32. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

33. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

34. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

35. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

36. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

37. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

38. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

39. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

40. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

41. What to Do

Calculate the work done by a person lifting a box from the floor to a shelf 2 meters high. The box weighs 10 newtons.

42. What to Think About

How much work is done by a person pushing a box 5 meters across a floor with a force of 10 newtons?

43. What to Write

Write a paragraph explaining the difference between *work* and *energy*.

Chapter Tests

[illegible]

Science Content Background

section 1 Work Power

The horsepower is a common, although nonmetric, unit of power. It was originally created by James Watt to compare his steam engines to the power of a horse. It is equivalent to 746 watts.

section 2 Using Machines Making Work Easier

Many machines allow a person to use less effort to do a job such as lifting an engine or opening a soda bottle. These machines do not reduce the amount of work that must be done. A smaller force must be applied over a greater distance to do the work.

Mechanical Advantage and Efficiency

A machine converts an input force to an output force. The ratio of the output force to the input force is the mechanical advantage of the machine. For a real machine, the output work done by the machine is always less than the input work. Friction always transforms some of the input work into heat. The efficiency of a machine is the output work divided by the input work.

section 3 Simple Machines Pulleys

The mechanical advantage of a pulley system equals the number of ropes that support the load. Ropes that attach one pulley to another are not counted. The rope that is pulled is counted if the direction of the applied force is in the same direction that the load moves.

Wheel and Axles

The diameter of the wheel is greater than the diameter of the axle. So a force applied on the wheel moves through a greater distance in one revolution than the force applied by the axle. If the amount of work done on the wheel is nearly equal to the amount of work done by the axle, then the force exerted on the wheel must be less than the force applied by the axle.

Wedges

A wedge is useful for two reasons. A downward force applied to a wedge is converted to a horizontal force exerted perpendicular to the sides of the wedge. Also, the wedge is narrower at one end. As a result, the narrow tip of the wedge exerts a higher pressure than the wider edge. This helps the wedge to penetrate materials.

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that . . .

A simple machine allows us to do less work.

The term *machine* often makes people think of things such as cars and power tools. By using fuel or electrical energy to do work, these machines do allow people to do less work. This conception of machines may create the misconception that simple machines also allow people to do less work. Additionally, the force used on a simple machine provides an immediate sensation to the worker. Using a simple machine to do a task often requires less effort and so it feels easier than doing the task without the machine, and this may contribute to the idea that less work is being done.

Activity

Ask students to write explanations of why people use simple machines such as the lever, pulley, and inclined plane. Have a few students read their explanations to the class. Then have the class try to decide which is the best explanation. [L2]

Promote Understanding

Activity

Show students a picture of movers pushing a large object up a ramp into the truck. Why do they use this ramp? Lead the discussion so students debate whether the movers do it to do less work or to use less effort. Have students do the following activity to find the answer. Organize the class into groups and give each group a spring scale, ruler, wooden plank, wood block with hook, and string. Tell them to follow these steps:

- Use the spring scale to lift the block from the floor to a chair, and note the reading from the scale as it rises.
- Measure the height of the chair, and multiply force times distance to obtain the work done lifting the block.

- Rest the plank on the chair so it rises at about a 45° angle from the ground. Pull the block up the plane to the chair, and measure the effort used by reading the scale while the block is moving.
- Measure the distance the block traveled and calculate the amount of work done.
- Compare the amounts of effort used and the amounts of work done in the two situations.

The results show that the simple machine made it easier to lift the load, but the amount of work students did with the ramp was the same or greater than the work done just lifting the block. [L2]

Assess

After completing the chapter, see *Identifying Misconceptions* in the Study Guide at the end of the chapter.

Lab Levers

Lab Using Simple Machines

- Virtual Lab What is the relationship between work, force, and distance?

It Seemed Longer Going Up

Have you ever thought of a mountain bike as a machine? A mountain bike actually is a combination of simple machines. Like all machines, a bicycle makes doing work easier. A mountain bike, for example, gets you uphill and downhill faster than you can travel by walking or running.

Science Journal Diagram a bicycle and identify the parts you think are simple machines.

152

Theme Connection

Systems and Interactions A simple machine is a system that has work done on it. It, in turn, does work on an object or another system. The machine does not lessen the amount of work done; it decreases the effort necessary to do the work.

About the Photo

Compound Machines Riding a mountain bike takes a lot of work, especially over rough terrain. But the gears and levers, wheels and axles help the rider accomplish that work with less effort and with more power. Compound machines like bicycles are excellent examples of how combinations of simple machines make both work and play easier.

Start-Up Activities

Doing Work with a Simple Machine

Did you know you can lift several times your own weight with the help of a pulley? Before the hydraulic lift was invented, a car mechanic used pulleys to raise a car off the ground. In this lab you'll see how a pulley can increase a force.

1. Tie a rope several meters in length to the center of a broom handle. Have one student hold both ends of the handle.

of a second broom handle and face the first student as shown in the photo.

3. Have a third student loop the free end of the rope around the second handle, making six or seven loops.
4. The third student should stand to the side of one of the handles and pull on the free end of the rope. The two students holding the broom handles should prevent the handles from coming together.
5. **Think Critically** Describe how the applied force was changed. What would happen if the number of rope loops were increased?

FOLDABLES™ Study Organizer

Work and Machines Make the following Foldable to help you understand how machines make doing work easier.

- STEP 1** Fold a sheet of paper vertically in half from top to bottom.

- STEP 2** Fold in half from side to side with the fold at the top.

- STEP 3** Unfold the paper once. Cut only the fold of the top flap to make two tabs.

- STEP 4** Turn the paper vertically and label the front tabs as shown.

List Before you read the chapter, list five examples of work you do without machines, and five examples of work you do with machines. Next to each example, rate the effort needed to do the work on a scale of 1 (little effort) to 3 (much effort).

Science online

Preview this chapter's content and activities at

Purpose Use the Launch Lab to introduce students to the force multiplying power of simple machines. **L2** **IS** **Kinesthetic**

Preparation Cut 8-m lengths of rope and collect two broom handles for each group.

Materials broom handles (2), 8-m length of rope

Teaching Strategy Tell the students holding the broom handles that they must keep the handles parallel to each other and they cannot place their hands or fingers on the rope.

Think Critically

The applied force was increased. The third group member easily could pull the broom handles together. Increasing the number of rope loops would increase the applied force even more.

Assessment

Performance Ask each group to predict how the results of the lab would have differed if the rope had been wrapped only twice around the poles. Ask students to test their predictions. The pulley will have far less mechanical advantage, and the student pulling on the rope will not be able to pull the two handles together as easily. Use **Performance Assessment in the Science Classroom**, p. 93.

FOLDABLES™ Study Organizer

Section Focus Transparency **Onward and Upward** **Chapter 6**

Backpacking is a lot of fun, but it also can be a lot of work. Whether hoisting the pack onto your back to start the hike or trudging up a long hill, you'll need to exert a good deal of effort to get to the next camp.

1. Compare the effort exerted by a backpacker moving over level ground to that exerted by a backpacker moving uphill.
2. How do you think the weight of the backpack affects the amount of force needed to move it?

L2

Reading Guide

What You'll Learn

- **Explain** the meaning of work.
- **Describe** how work and energy are related.
- **Calculate** work.
- **Calculate** power.

Why It's Important

Doing work is another way of transferring energy from one place to another.

Review Vocabulary

energy: the ability to cause change

New Vocabulary

- work
- power

What is work?

Have you done any work today? To many people, the word *work* means something they do to earn money. In that sense, work can be anything from filling fast-food orders or loading trucks to teaching or doing word processing on a computer. The word *work* also means exerting a force with your muscles. A person might say he or she does work while pushing as hard as they can against a wall that doesn't move. However, in science the word *work* is used in a different way.

Figure 1 When you lift a stack of books, your arms apply a force upward and the books move upward. Because the force and distance are in the same direction, your arms have done work on the books.

Work Makes Something Move Press your hand against the surface of your desk as hard as you can. Have you done any work? The answer is no, no matter how tired your effort makes you feel. Remember that a force is a push or a pull. For work to be done, a force must make something move. **Work** is the energy transferred when a force makes an object move. If you push against the desk and it doesn't move, then you haven't done any work on the desk.

Doing Work There are two conditions that have to be satisfied for a force to do work on an object. One is that the applied force must make the object move, and the other is that the movement must be in the same direction as the applied force.

For example, if you pick up a pile of books from the floor, as in **Figure 1**, you do work on the books. The books move upward, in the direction of the force you are applying. If you hold the books in your arms without moving the books, you are not doing work on the books. You're still applying an upward force to keep the books from falling, but no movement is taking place.

Tie to Prior Knowledge

Student Work Ask students what types of work they do. They might mention cutting grass, taking out garbage, or caring for a younger sibling. In this section they will learn that the scientific definition of work is different from the everyday definition.

Vocabulary Analogy Tell students that work in science can be compared to homework in some ways. A person can devote time to homework by sitting at a table doing nothing. Until the reading, writing, or project required is accomplished, the work is not complete. In science, work is not just exerting a force on an object, but actually moving an object a distance.

Content Background

Emphasize that although the words *work*, *energy*, and *power* have multiple meanings and are common in everyday speech, in science these words have a specific meaning.

Caption Answer

Figure 3 The potential energy of the box increases as the box is moved up the stairs because the height of the box increases.

Activity

Analyzing Forces Have a volunteer press against the wall. Ask students whether or not the person is doing work on the wall. **No, because the wall is not moving in the direction of the applied force.** Repeat this demonstration for various other activities, such as raising an object vertically or carrying an object horizontally. If there is more than one force involved, help students analyze which forces are doing work and which are not. **L2 IS Kinesthetic**

✓ Reading Check

Answer The applied force and the object's motion must be in the same direction for work to be done.

Virtual Labs

Work, Force, Distance
What is the relationship between work, force, and distance?

Force and Direction of Motion When you carry books while walking, like the student in **Figure 2**, you might think that your arms are doing work. After all, you are exerting a force on the books with your arms, and the books are moving. Your arms might even feel tired. However, in this case the force exerted by your arms does no work on the books. The force exerted by your arms on the books is upward, but the books are moving horizontally. The force you exert upward is at right angles to the direction the books are moving. As a result, your arms exert no force in the direction the books are moving.

✓ Reading Check How are an applied force and an object's motion related when work is done?

Work and Energy

How are work and energy related? When work is done, a transfer of energy always occurs. This is easier to understand when you think about carrying a heavy box up a flight of stairs. Remember that when the height of an object above Earth's surface increases, the gravitational potential energy of the object increases. As you move up the stairs, you increase the height of the box above Earth's surface. This causes the gravitational potential energy of the box to increase.

You may recall that energy is the ability to cause change. If something has energy, it can transfer energy to another object by doing work on that object. When you do work on an object, you increase its energy. The student carrying the box in **Figure 3** transfers chemical energy in his muscles to the box. Energy is always transferred from the object that is doing the work to the object on which the work is done.

Figure 3 By carrying a box up the stairs, you are doing work. You transfer energy to the box.
Explain how the energy of the box changes as the student climbs the stairs.

Figure 2 If you hold a stack of books and walk forward, your arms are exerting a force upward. However, the distance the books move is horizontal. Therefore, your arms are not doing work on the books.

Science Journal

Relating Work and Energy Have students write descriptions in their Science Journals of situations they have seen or been a part of in which work has been done or energy has been transferred. Ask them to include at least one example of a situation in which energy was transferred but no work was done. **L2 IS Linguistic**

Differentiated Instruction

Challenge Have students use the definition of work to define power in terms of velocity. Ask students to relate this to the power of lifting a mass.
$$P = \frac{W}{t} = \frac{(F \times d)}{t} = F \times \left(\frac{d}{t}\right) = F \times v,$$
where *v* is the constant rate at which the mass is moving vertically **L3 IS Logical-Mathematical**

Quick Demo

Calculating Work

Materials spring scale, 1-kg mass

Estimated Time 5 minutes

Procedure Hook a spring scale to a 1-kg mass. Using the spring scale, raise the mass 1 m at a constant velocity. Let students read the spring scale, which should read approximately 10 N. Tell them you have just done 10 J of work. Give students the opportunity to repeat your demonstration.

L2 **IS** Visual-Spatial

Activity

Joule The unit of work is the joule. Ask students to express a joule in basic SI units. $W = F \times d$
 $= m \times a \times d$;

therefore, $1 \text{ J} = 1 \text{ kg} \cdot \frac{\text{m}^2}{\text{s}^2}$ **L2**

IS Logical-Mathematical

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.2

Answers to Practice Problems

1. $W = Fd = (75 \text{ N})(5 \text{ m}) = 375 \text{ J}$

2. $d = \frac{W}{F} = \frac{12,000 \text{ J}}{80 \text{ N}} = 150 \text{ m}$

3. $F = \frac{W}{d} = \frac{240,000 \text{ J}}{50 \text{ m}} = 4,800 \text{ N}$

Discussion

Force and Work Suppose you push a book with a constant force of 25 N for a distance of 20 cm. The book then slides for an additional 80 cm. Did you do 5 J of work or 25 J of work? Explain. You did 5 J of work because you only exerted a force on the book for the first 20 cm of its journey.

L2 **IS** Logical-Mathematical

Calculating Work The amount of work done depends on the amount of force exerted and the distance over which the force is applied. When a force is exerted and an object moves in the direction of the force, the amount of work done can be calculated as follows.

Work Equation

work (in joules) = applied force (in newtons) $\times$ distance (in meters)

$$W = Fd$$

In this equation, force is measured in newtons and distance is measured in meters. Work, like energy, is measured in joules. One joule is about the amount of work required to lift a baseball a vertical distance of 0.7 m.

Applying Math

Solve a Simple Equation

WORK You push a refrigerator with a force of 100 N. If you move the refrigerator a distance of 5 m, how much work do you do?

IDENTIFY known values and the unknown value

Identify the known values:

you push a refrigerator with a force of 100 N $\Rightarrow F = 100 \text{ N}$

you move the refrigerator a distance of 5 m $\Rightarrow d = 5 \text{ m}$

Identify the unknown value:

how much work you do $\Rightarrow W = ? \text{ J}$

SOLVE the problem

Substitute the known values $F = 100 \text{ N}$ and $d = 5 \text{ m}$ into the work equation.

$$W = Fd = (100 \text{ N})(5 \text{ m}) = 500 \text{ Nm} = 500 \text{ J}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the work you calculated by the force given in the problem. The result should be the distance given in the problem.

Practice Problems

1. A force of 75 N is exerted on a 45-kg couch, and the couch is moved 5 m. How much work is done in moving the couch?
2. A lawn mower is pushed with a force of 80 N. If 12,000 J of work is done in mowing a lawn, what is the total distance the lawn mower was pushed?
3. The brakes on a car do 240,000 J of work in stopping the car. If the car travels a distance of 50 m while the brakes are being applied, what is the force the brakes exert on the car?

For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

Curriculum Connection

History James Prescott Joule was a British scientist who lived from 1818 to 1889. Ask students to find out why the unit of work was named for him. Joule established the relationship between heat and mechanical energy, called the mechanical equivalent of heat. **L2**

IS Linguistic

Teacher FYI

Power The metric unit of power is the watt, or joule/s. The power of heating and cooling units is often given in British thermal units (Btu) per second. One Btu per second is about 1,055 watts. The power of motors and engines is usually given in horsepower. One horsepower is equal to about 746 watts.

Figure 4 A pitcher exerts a force on the ball to throw it to the catcher. After the ball leaves her hand, the pitcher no longer is exerting any force on the ball. She does work on the ball only while it is in her hand.

When is work done? Suppose you give a book a push and it slides along a table for a distance of 1 m before it comes to a stop. The distance you use to calculate the work you did is how far the object moved while the force was being applied. Even though the book moved 1 m, you did work on the book only while your hand was in contact with it. The distance in the formula for work is the distance the book moved while your hand was pushing on the book. As **Figure 4** shows, work is done on an object only when a force is being applied to the object.

Power

Suppose you and another student are pushing boxes of books up a ramp to load them into a truck. To make the job fun, you make a game of it, racing to see who can push a box up the ramp faster. The boxes weigh the same, but your friend is able to push a box a little faster than you can. She moves a box up the ramp in 30 s. It takes you 45 s. You both do the same amount of work on the books because the boxes weigh the same and are moved the same distance. The only difference is the time it takes to do the work.

In this game, your friend has more power than you do. **Power** is the amount of work done in one second. It is a rate, the rate at which work is done.

Reading Check How is power related to work?

Mini LAB

Calculating Your Work and Power

Procedure

1. Find a set of stairs that you can safely walk and run up. Measure the vertical height of the stairs in meters.
2. Record how many seconds it takes you to walk and then run up the stairs.
3. Calculate the work you did in both walking and running up the stairs. The force is your weight in newtons (your weight in pounds times 4.5). The distance is the vertical height of the stairs.
4. Use the formula $P = W/t$ to calculate the power you needed to both walk and to run up the stairs.

Analysis

1. Is the work you did walking and running up the steps the same?
2. Which required more power, walking or running up the steps? Why?

Mini LAB

Video Lab available.

Purpose Students measure work and power. **Kinesthetic**

Materials stairs, stopwatch or clock, meterstick

Teaching Strategy Suggest students work in pairs so one can time while the other climbs the stairs.

Safety Precautions Caution students to choose a set of stairs that they can run up without slipping.

Analysis

1. Yes; the work is independent of speed.
2. More power is used running than walking, because you do the same amount of work in less time.

Assessment

Content Have students work in small groups to write short rhymes to help them remember the relationships among force, distance, work, and power. Use **Performance Assessment in the Science Classroom**, p. 151.

Reading Check

Answer Power is the amount of work done per second.

Reading Strategy

Shared Reading Take time to read the text of this section aloud and pause to discuss the concepts. Restate or paraphrase as needed for students to understand the concepts. Work through the formulas step by step. Allow students to practice comprehending text by asking volunteers to read and explain passages in their own words.

Differentiated Instruction

Physically Challenged Students in wheelchairs can do the MiniLAB by using a ramp instead of stairs. Students can time themselves going up the ramp at a slow rate, and then time themselves going up the ramp quickly. Point out that in order to calculate the force, students will need to know the weight of the wheelchair in newtons.

Visual Learning

Figure 4 Point out that work is done by the pitcher only while she still has the ball in her hand. The distance over which she moves her arm to throw the ball and the force with which she throws it determine how much work she does. After she lets go of the ball, work is done by gravity to make it fall.

Discussion

Work v. Power Suppose two students are asked to unpack identical cartons of books. One student completes the job in ten minutes, while the other takes twenty minutes. Which student did more work? **Both students did the same amount of work.** Which student used more power? **the one who finished in the least amount of time**

  **Logical-Mathematical**

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.2

Answers to Practice Problems

1. $P = \frac{W}{t} = \frac{50 \text{ J}}{0.5 \text{ s}} = 100 \text{ W}$

2. $W = Pt = \left(\frac{130 \text{ J}}{\text{s}}\right) \times (10 \text{ min})$
 $\times \left(\frac{60 \text{ s}}{1 \text{ min}}\right) = 78,000 \text{ J}$

3. $t = \frac{W}{P} = \frac{10,000 \text{ J}}{500 \text{ J/s}} = 20 \text{ s}$

Post Reading

Question a Partner Place students in pairs. Have them make flash cards and quiz one another on the definitions and formulas for *work*, *power*, and *power when energy is transferred*. Students also should explain the concepts behind each formula in their own words.

The symbol for work, *W*, is usually italicized. However, the abbreviation for watt, *W*, is not italicized.

Calculating Power Power is the rate at which work is done. To calculate power, divide the work done by the time that is required to do the work.

Power Equation

$$\text{power (in watts)} = \frac{\text{work (in joules)}}{\text{time (in seconds)}}$$
$$P = \frac{W}{t}$$

The SI unit for power is the watt (W). One watt equals one joule of work done in one second. Because the watt is a small unit, power often is expressed in kilowatts. One kilowatt (kW) equals 1,000 W.

Applying Math Solve a Simple Equation

POWER You do 900 J of work in pushing a sofa. If it took 5 s to move the sofa, what was your power?

IDENTIFY known values and the unknown value

Identify the known values:

You do 900 J of work  $W = 900 \text{ J}$

it took 5 s to move the sofa  $t = 5 \text{ s}$

Identify the unknown value:

what was your power?  $P = ? \text{ W}$

SOLVE the problem

Substitute the known values $W = 900 \text{ J}$ and $t = 5 \text{ s}$ into the power equation.

$$P = \frac{W}{t} = \frac{900 \text{ J}}{5 \text{ s}} = 180 \text{ J/s} = 180 \text{ W}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by multiplying the power you calculated by the time given in the problem. The result should be the work given in the problem.

Practice Problems

1. To lift a baby from a crib, 50 J of work is done. How much power is needed if the baby is lifted in 0.5 s?
2. If a runner's power is 130 W, how much work is done by the runner in 10 minutes?
3. The power produced by an electric motor is 500 W. How long will it take the motor to do 10,000 J of work?

For more practice problems go to page 879, and visit Math Practice at fl.gpescience.com.

Curriculum Connection

Health Nutritionists recommend a daily diet of about 9,000,000 J (2,100 Cal) to maintain health. Have students calculate the average power that this diet would generate in a 24-hour period. There are $60 \times 60 \times 24 = 86,400$ seconds in 24 hours. Therefore, the amount of power is $9,000,000 \text{ J} \div 86,400 \text{ s} = 104 \text{ watts}$.   **Logical-Mathematical**

Fun Fact

One horsepower was the average amount of work a horse could do in one day. Watt underestimated the amount of work his engines could do by about 67 percent so that he would not be accused of exaggeration.

Power and Energy Doing work is a way of transferring energy from one object to another. Just as power is the rate at which work is done, power is also the rate at which energy is transferred. When energy is transferred, the power involved can be calculated by dividing the energy transferred by the time needed for the transfer to occur.

Power Equation for Energy Transfer

$$\text{power (in watts)} = \frac{\text{energy transferred (in joules)}}{\text{time (in seconds)}}$$

$$P = \frac{E}{t}$$

For example, when the lightbulb in **Figure 5** is connected to an electric circuit, energy is transferred from the circuit to the lightbulb filament. The filament converts the electrical energy supplied to the lightbulb into heat and light. The power used by the lightbulb is the amount of electrical energy transferred to the lightbulb each second.

Figure 5 This 100-W lightbulb converts electrical energy into light and heat at a rate of 100 J/s.

DAILY INTERVENTION

Check for Understanding

Logical-Mathematical Have students make a chart that compares the work done and the power it took for each of five students to climb the stairs in the MiniLAB in this section. What one variable determines the different values for work done? **student weight** What two variables determine the difference in power values? **student weight and time** [L2]

Reteach

Work and Power Ask students to name various activities they enjoy. Have the class discuss the work done and the amount of power used while performing each activity. [L2] **Interpersonal**

Assessment

Portfolio Have students make posters that define the SI units for force, work, and power and illustrate the relationships among them. Use **PASC**, p. 145. [L2]

section 1

review

Summary

Work and Energy

- Work is done on an object when a force is exerted on the object and it moves in the direction of the force.
- If a force, *F*, is exerted on an object while the object moves a distance, *d*, in the direction of the force, the work done is

$$W = Fd$$

- When work is done on an object, energy is transferred to the object.

Power

- Power is the rate at which work is done or energy is transferred.
- When work is done, power can be calculated from the equation

$$P = \frac{W}{t}$$

- When energy is transferred, power can be calculated from the equation

$$P = \frac{E}{t}$$

Self Check

1. **Explain** how the scientific definition of *work* is different from the everyday meaning.
2. **Describe** a situation in which a force is applied but no work is done.
3. **Explain** how work and energy are related.
4. **Think Critically** In which of the following situations is work being done?
 - a. A person shovels snow off a sidewalk.
 - b. A worker lifts bricks, one at a time, from the ground to the back of a truck.
 - c. A roofer's assistant carries a bundle of shingles across a construction site.

Applying Math

5. **Calculate Force** Find the force a person exerts in pulling a wagon 20 m if 1,500 J of work is done.
6. **Calculate Work** A car's engine produces 100 kW of power. How much work does the engine do in 5 s?
7. **Calculate Energy** A color TV uses 120 W of power. How much energy does the TV use in 1 hour?

section 1

review

1. The scientific definition requires that a force act on an object and that the object move in the direction of that force. The everyday meaning requires that an effort be exerted.
2. Accept any answer in which a force is applied but the object does not move in the direction of the force.
3. Work is the energy transferred when a force makes an object move.
4. a. Work is being done when the snow is lifted up by the shovel. Work also is done if the person tosses the snow out of the shovel.
5. $F = \frac{W}{d} = \frac{1,500 \text{ J}}{20 \text{ m}} = 75 \text{ N}$
6. Work is done when the worker lifts the brick off the ground and pushes the brick along the bed of the truck. c. The assistant does no work while carrying the shingles.

$$6. W = Pt = (100,000 \text{ J/s})(5 \text{ s}) = 500,000 \text{ J}$$

$$7. E = Pt = (120 \text{ J/s})(1 \text{ h}) \left(\frac{60 \text{ min}}{1 \text{ h}} \right) \left(\frac{60 \text{ s}}{1 \text{ min}} \right) = 20 \text{ J}$$

Using Machines

Tie to Prior Knowledge

Easier Work Ask students to name ways that machines make work easier. They might mention that a shovel makes lifting dirt easier, and a hammer makes pushing a nail into wood easier. In this section, students will use the scientific definition of work to learn how machines make work easier.

Facets of Meaning Ask students what would make a person efficient or inefficient. Write “efficient behaviors” and “inefficient behaviors” on the board. Brainstorm ideas and list them under each category. Then ask if a car or machine can be efficient. What would make a car or machine efficient?

Reading Guide

What You'll Learn

- **Explain** how machines make doing work easier.
- **Calculate** the mechanical advantage of a machine.
- **Calculate** the efficiency of a machine.

Why It's Important

Cars, stairs, and teeth are all examples of machines that make your life easier.

Review Vocabulary

force: a push or a pull

New Vocabulary

- machine
- input force
- output force
- mechanical advantage
- efficiency

What is a machine?

A **machine** is a device that makes doing work easier. When you think of a machine, you may picture a device with an engine and many moving parts. However, machines can be simple. Some machines, such as knives, scissors, and doorknobs, are used every day to make doing work easier.

Making Work Easier

Machines can make work easier by increasing the force that can be applied to an object. A screwdriver increases the force you apply to a screw. A second way that machines can make work easier is by increasing the distance over which a force can be applied. A leaf rake is an example of this type of machine.

Machines also can make work easier by changing the direction of an applied force. A simple pulley changes a downward force to an upward force.

Figure 6 A car jack is an example of a machine that increases an applied force.

Increasing Force A car jack, such as the one in **Figure 6**, is an example of a machine that increases an applied force. The upward force exerted by the jack is greater than the downward force you exert on the handle. However, the distance you push the handle downward is greater than the distance the car is pushed upward. Because work is the product of force and distance, the work done by the jack is not greater than the work you do on the jack. The jack increases the applied force, but it doesn't increase the work done.

Figure 7 Whether the mover slides the chair up the ramp or lifts it directly into the truck, she will do the same amount of work. Doing the work over a longer distance allows her to use less force.

Discussion

Everyday Machines Ask students to name devices that make work easier but aren't normally called machines in everyday conversations. Some examples are a bicycle, a can opener, and a rake. Discuss how each device makes work easier.

L1 **IS** Linguistic

Activity

Changing Force Direction Have students experiment with lifting a load using a simple fixed pulley and using a screwdriver to pry the lid off a can. For each activity, have students try to do the job without changing the direction of force. **L2** **IS** Kinesthetic

✓ Reading Check

Answer Less force is needed to lift an object when using a ramp.

Reading Strategy

Paired Reading Ask students to read this section in pairs and note statements that use “is equal to” and “is” to abbreviate, define, or explain concepts about machines. Have students take notes using heading titles and writing notes as equations, such as $\text{Input Force} = F_{\text{in}}$.

Force and Distance Why does the mover in **Figure 7** push the heavy furniture up the ramp instead of lifting it into the truck? It is easier because less force is needed to push the furniture up the ramp than is needed to lift it.

The work done in lifting an object depends on the change in height of the object. The same amount of work is done whether the mover pushes the furniture up the long ramp or lifts it straight up. If she uses a ramp to lift the furniture, she moves the furniture a longer distance than if she just raised it straight up. If the work stays the same and the distance is increased, then less force will be needed to do the work.

✓ Reading Check How does a ramp make lifting an object easier?

Changing Direction Some machines change the direction of the force you apply. When you use the car jack, you exert a force downward on the jack handle. The force exerted by the jack on the car is upward. The direction of the force you apply is changed from downward to upward. Some machines change the direction of the force that is applied to them in another way. The wedge-shaped blade of an ax is one example. When you use an ax to split wood, you exert a downward force as you swing the ax toward the wood. As **Figure 8** shows, the blade changes the downward force into a horizontal force that splits the wood apart.

Figure 8 An ax blade changes the direction of the force from vertical to horizontal.

Differentiated Instruction

Learning Disabled Have students push a heavy box up a gentle ramp. Keep the ramp the same height, but make it shorter and therefore steeper. Then ask students to push the box again. Do this several times with increasingly shorter and steeper ramps to help students understand the relationship between the distance the box moves and the force required to move it. **L1**

Challenge Tell students that some machines have a mechanical advantage that is less than 1. Have them find out why these machines are still useful. In these machines the input force is greater than the output force. These machines can be useful if they increase the distance an object moves or its speed. **L3** **IS** Logical-Mathematical.

Mini LAB

Purpose Students observe how machines multiply a person's force of effort. **L2**

K Kinesthetic

Materials two cans of food, manual can opener, metric ruler

Teaching Strategy Explain to students that the length of the can opener handle is the diameter of the circle or "wheel" that they must turn to be able to move the small circle or "axle" of the cutting blade. The can opener functions as a wheel and axle. To gain force from the cutting blade, they must move the handle a greater distance. **E**

Safety Precaution Caution students not to touch can opener's cutting blades or cut edges of the can's lid.

Analysis

1. Opening the first can was much easier than opening the second can.
2. An input force applied to the can opener's handle is increased so that the output force of the blade is able to cut the can. A longer handle would decrease the input force required to open the can.

Assessment

Process Show students a door handle and ask them to infer how the handle multiplies the force of the person opening the door. Like the can opener, the door handle works as a wheel and axle. The handle is the large "wheel" that easily turns the metal rod or "axle" inserted into the door lock. Use Performance Assessment in the Science Classroom, p. 89.

Figure 9 A crowbar increases the force you apply and changes its direction.

Mini LAB

Machines Multiplying Force

Procedure **E**

1. Open a can of food using a manual can opener that has circular blades.
WARNING: Do not touch can opener's cutting blades or the cut edges of the cans' lids.
2. Open another can of food, but this time grasp the handle as close as you can to the handle's pivot point.

Analysis

1. Compare how difficult it was to open the first can with how difficult it was to open the second can.
2. Infer why a can opener makes it easier to open a metal can. How would you design a can opener to make opening cans even easier?

The Work Done by Machines

To pry the lid off a wooden crate with a crowbar, you'd slip the end of the crowbar under the edge of the crate lid and push down on the handle. By moving the handle downward, you do work on the crowbar. As the crowbar moves, it does work on the lid, lifting it up. **Figure 9** shows how the crowbar increases the amount of force being applied and changes the direction of the force.

When you use a machine such as a crowbar, you are moving something that resists being moved. For example, if you use a crowbar to pry the lid off a crate, you are working against the friction between the nails in the lid and the crate. You also could use a crowbar to move a large rock. In this case, you would be working against gravity—the weight of the rock.

Input and Output Forces Two forces are involved when a machine is used to do work. You exert a force on the machine, such as a bottle opener, and the machine then exerts a force on the object you are trying to move, such as a bottle cap. The force that is applied to the machine is called the **input force**. F_{in} stands for the input force. The force applied by the machine is called the **output force**, symbolized by F_{out} . When you try to pull a nail out of wood with a hammer, as in **Figure 10**, you apply the input force on the handle. The output force is the force the claw applies to the nail.

Two kinds of work need to be considered when you use a machine: the work done by you on the machine and the work done by the machine. When you use a crowbar, you do work when you apply force to the crowbar handle and make it move. The work done by you on a machine is called the input work and is symbolized by W_{in} . The work done by the machine is called the output work and is abbreviated W_{out} .

Science Journal

Work In and Work Out Have students choose two simple machines that they have used. For each simple machine, write a short paragraph describing the work in and the work out. Describe how the machine simplifies a task. Machines used might include shovel, bicycle, broom, screwdriver, and scissors.

L2 **K** Linguistic

Curriculum Connection

Art Leonardo da Vinci is famous for such well-known paintings as *Mona Lisa* and *The Last Supper*. However, he was also the inventor of an extraordinary collection of machines. Have students research Leonardo da Vinci and prepare a computer presentation showing how his work with mechanical devices inspired much of the technology we use today. **L2** **K** Visual-Spatial

Conserving Energy Remember that energy is always conserved. When you do work on a machine, you transfer energy to the machine. When the machine does work on an object, energy is transferred from the machine to the object. Because energy cannot be created or destroyed, the amount of energy the machine transfers to the object cannot be greater than the amount of energy you transfer to the machine. A machine cannot create energy, so W_{out} is never greater than W_{in} .

However, the machine does not transfer all of the energy it receives to the object. In fact, when a machine is used, some of the input energy changes to thermal energy due to friction. The energy that changes to thermal energy cannot be used to do work, so W_{out} is always smaller than W_{in} .

Ideal Machines Remember that work is calculated by multiplying force by distance. The input work is the product of the input force and the distance over which the input force is exerted. The output work is the product of the output force and the distance over which that force is exerted.

Suppose a perfect machine could be built in which there were no friction. None of the input work or output work would be converted to thermal energy. For such an ideal machine, the input work would equal the output work. For an ideal machine,

$$W_{\text{in}} = W_{\text{out}}$$

Suppose the ideal machine increases the force applied to it. This means that the output force, F_{out} , is greater than the input force, F_{in} . Recall that work is equal to force times distance. If F_{out} is greater than F_{in} , then W_{in} and W_{out} can be equal only if the input force is applied over a greater distance than the output force.

For example, suppose the hammer claw in **Figure 10** moves a distance of 1 cm to remove a nail. If an output force of 1,500 N is exerted by the claw of the hammer, and you move the handle of the hammer 5 cm, you can find the input force as follows.

$$\begin{aligned} W_{\text{in}} &= W_{\text{out}} \\ F_{\text{in}} d_{\text{in}} &= F_{\text{out}} d_{\text{out}} \\ F_{\text{in}} (0.05 \text{ m}) &= (1,500 \text{ N}) (0.01 \text{ m}) \\ F_{\text{in}} (0.05 \text{ m}) &= 15 \text{ N}\cdot\text{m} \\ F_{\text{in}} &= 300 \text{ N} \end{aligned}$$

Because the distance you move the hammer is longer than the distance the hammer moves the nail, the input force is less than the output force.

Figure 10 When prying a nail out of a piece of wood with a claw hammer, you exert the input force on the handle of the hammer, and the claw exerts the output force.

Describe how the hammer changes the input force.

Scienceonline

Topic: Rube Goldberg

Visit fl.gpscience.com for Web links to information about Rube Goldberg devices.

Activity Use the information that you find to sketch a Rube-Goldberg-like device designed to burst a balloon.

Quick Demo Changing Energy

Materials wood, claw hammer

Estimated Time five minutes

Procedure Bring to class a piece of wood with a nail pounded almost all the way into it. In front of the class, use a claw hammer to pull the nail out of the wood. Invite students to touch the warm nail to show how some of the work was converted to thermal energy. **L2** **IS**

Visual-Kinesthetic

Caption Answer

Figure 10 The hammer produces an output force that is greater than the input force, but the output force is applied over a shorter distance than the input force.

Misconceptions

Always Work Students may think that simple machines allow us to do less work. See page F at the beginning of this chapter for teaching strategies that address this misconception.

Visual Learning

Figure 10 Point out the fact that although this hammer is not an ideal machine, most of the input work is converted to work done on the nail. This means that $W_{\text{in}} \approx W_{\text{out}}$. Since work = force $\times$ distance, if the hammer handle is moved

a large distance with a small force, then the claw, which moves a short distance, will exert a large force. Have students draw a diagram to show this relationship. **L2** **IS** **Visual-Spatial**

Activity

Crowbar MA Ask students to calculate the mechanical advantage of a crowbar to which you apply 100 N of force to lift a 250-N rock.

$$MA = \frac{F_{out}}{F_{in}} = 250 \text{ N} \div 100 \text{ N} = 2.5$$

L3 **Logical-Mathematical**

Fun Fact

Mechanical advantage also can be determined by dividing the input distance by the output distance.

Graphite Lubricant Graphite is composed of carbon atoms formed into linked hexagons arranged in weakly bonded layers. Graphite is useful as a lubricant because the layers can slide easily over one another. When graphite is applied to the moving parts of machines, the sliding of the layers reduces the effects of friction.

Research Have students research other types of lubricants such as Teflon, lithium grease, Freon and tungsten oxide that are used in industry to help cut down on wear and tear and heat loss due to friction between moving parts in machines. **L2**

Reading Check

Answer because some of the input work is converted into thermal energy by friction

Figure 11 Window blinds use a machine that changes the direction of an input force. A downward pull on the cord is changed to an upward force on the blinds. The input and output forces are equal, so the *MA* is 1.

Graphite Lubricant

Graphite is a solid that sometimes is used as a lubricant to increase the efficiency of machines. Find out what element graphite is made of and why graphite is a good lubricant.

Mechanical Advantage

Machines such as the car jack, the ramp, the crow bar, and the claw hammer make work easier by making the output force greater than the input force. The ratio of the output force to the input force is the **mechanical advantage** of a machine. The mechanical advantage (*MA*) of a machine can be calculated with the following equation.

Mechanical Advantage Equation

$$\text{mechanical advantage} = \frac{\text{output force (in newtons)}}{\text{input force (in newtons)}}$$

$$MA = \frac{F_{out}}{F_{in}}$$

Figure 11 shows that the mechanical advantage equals one when only the direction of the input force changes.

Ideal Mechanical Advantage The mechanical advantage of a machine without friction is called the ideal mechanical advantage, or *IMA*. The *IMA* can be calculated by dividing the input distance by the output distance. For a real machine, the *IMA* would be the mechanical advantage of the machine if there were no friction.

Efficiency

For real machines, some of the energy put into a machine is always converted to thermal energy by frictional forces. For this reason, the output work of a machine is always less than the work put into the machine.

Efficiency is a measure of how much of the work put into a machine is changed into useful output work by the machine. A machine with high efficiency produces less thermal energy from friction, so more of the input work is changed to useful output work.

Reading Check

Why is the output work always less than the input work for a real machine?

Teacher FYI

MA Information Mechanical advantage (*MA*) is output force divided input force. If *MA* is less than 1, the input force is greater than the output force. If *MA* equals 1, the machine only changes the direction of the input force. If *MA* is greater than 1, the machine increases the output force.

Calculating Efficiency To calculate the efficiency of a machine, the output work is divided by the input work. Efficiency is usually expressed as a percentage by this equation:

Efficiency Equation

$$\text{efficiency (\%)} = \frac{\text{output work (in joules)}}{\text{input work (in joules)}} \times 100\%$$

$$\text{efficiency} = \frac{W_{\text{out}}}{W_{\text{in}}} \times 100\%$$

In an ideal machine, there is no friction and the output work equals the input work. So the efficiency of an ideal machine is 100 percent. In a real machine, friction causes the output work to always be less than the input work. So the efficiency of a real machine is always less than 100 percent.

Increasing Efficiency Machines can be made more efficient by reducing friction. This usually is done by adding a lubricant, such as oil or grease, to surfaces that rub together, as shown in **Figure 12**. A lubricant fills in the gaps between the surfaces, enabling the surfaces to slide past each other more easily.

Figure 12 Oil reduces the friction between two surfaces. Oil fills the space between the surfaces so high spots don't rub against each other.

Post Reading

Paired Discussion Ask students to review the principles and formulas related to Ideal Machines and Ideal Mechanical Advantage. Allow five minutes for a discussion of the concepts contained within the text. Have students switch partners and continue the discussion.

3 Assess

DAILY INTERVENTION

Check for Understanding
Kinesthetic Set up a wood ramp. Use a spring balance to pull a smooth wood block up the ramp. Measure the force and calculate the work done. Tape sandpaper along the length of the ramp and repeat the procedure. Ask the students which machine was more efficient and why. Ask how they could improve the efficiency of the second ramp without removing the sandpaper. *They could put something smooth over the sandpaper.*
 [L2]

Reteach
Machines Bring in various simple machines for students to examine. For each one, have students decide whether the machine works by increasing force, increasing distance, or changing the direction of the force. [L2]
 [S] **Visual-Spatial**

section 2

review

Summary

Work and Machines

- Machines make doing work easier by changing the applied force, changing the distance over which the force is applied, or changing the direction of the applied force.
- Because energy cannot be created or destroyed, the output work cannot be greater than the input work.
- In a real machine, some of the input work is converted into heat by friction.

Mechanical Advantage and Efficiency

- The mechanical advantage of a machine is the output force divided by the input force:

$$MA = \frac{F_{\text{out}}}{F_{\text{in}}}$$
- The efficiency of a machine is the output work divided by the input work times 100%:

$$\text{efficiency} = \frac{W_{\text{out}}}{W_{\text{in}}} \times 100\%$$

Self Check

- Describe** the circumstances for which the output work would equal the input work in a machine.
- Infer** how lubricating a machine affects the output force exerted by the machine.
- Explain** why, in a real machine, the output work is always less than the input work.
- Think Critically** The mechanical advantage of a machine is less than one. Compare the distances over which the input and output forces are applied.

Applying Math

- Calculate** the mechanical advantage of a hammer if the input force is 125 N and the output force is 2,000 N.
- Calculate Efficiency** Find the efficiency of a machine that does 800 J of work if the input work is 2,400 J.
- Calculate Force** Find the force needed to lift a 2,000-N weight using a machine with a mechanical advantage of 15.

section 2

review

- The machine would have to be an ideal machine in which there was no friction.
- Friction is a force that opposes the motion of two surface sliding past each other. Lubricating a machine increases the output force because it decreases friction.
- In a real machine, some of the input work is converted into thermal energy by friction.
- The distance over which the output force is applied is greater than the distance that the input force is applied.
- $MA = \frac{F_{\text{out}}}{F_{\text{in}}} = 16$
- $\text{eff} = \frac{W_{\text{out}}}{W_{\text{in}}} \times 100\% = 33\%$
- $F_{\text{in}} = \frac{F_{\text{out}}}{MA} = 133 \text{ N}$

MA.D.1.4.2

Assessment

Process Have each student choose a machine and prepare a presentation showing different ways to reduce friction in the machine and increase its efficiency. *Possible ways of reducing friction include using bearings, wheels, or a lubricant. Use PASC, p. 143.* [L2] [P]

Tie to Prior Knowledge

Define MA Ask students to define mechanical advantage. **the number of times a machine multiplies the effort force applied to it** Tell them that in this section they will learn how the design of a simple machine affects its mechanical advantage. L2

Activate Background Knowledge

Read aloud the vocabulary words and ask students if they have heard these words before. Discuss what they know about the six simple machines. Talk about the concepts of simple and compound and ask them to predict what a compound machine might be.

Reading Guide

What You'll Learn

- Describe the six types of simple machines.
- Explain how the different types of simple machines make doing work easier.
- Calculate the ideal mechanical advantage of the different types of simple machines.

Why It's Important

All complex machines, such as cars, are made of simple machines. Even your body contains simple machines.

Review Vocabulary

compound: composed of separate elements or parts

New Vocabulary

- simple machine
- lever
- pulley
- wheel and axle
- inclined plane
- screw
- wedge
- compound machine

Figure 13 There are three classes of levers.

First-Class Lever

The fulcrum is between the input force and the output force.

Second-Class Lever

The output force is between the fulcrum and the input force.

Third-Class Lever

The input force is between the fulcrum and the output force.

Types of Simple Machines

If you cut your food with a knife, use a screwdriver, or even chew your food, you are using a simple machine. A **simple machine** is a machine that does work with only one movement of the machine. There are six types of simple machines: lever, pulley, wheel and axle, inclined plane, screw, and wedge. The pulley and the wheel and axle are modified levers, and the screw and the wedge are modified inclined planes.

Levers

You've used a lever if you've used a wheelbarrow, a lawn rake, or swung a baseball bat. A **lever** is a bar that is free to pivot or turn around a fixed point. The fixed point the lever pivots on is called the fulcrum. The input arm of the lever is the distance from the fulcrum to the point where the input force is applied. The output arm is the distance from the fulcrum to the point where the output force is exerted by the lever.

The output force produced by a lever depends on the lengths of the input arm and the output arm. If the output arm is longer than the input arm, the law of conservation of energy requires that the output force be less than the input force. If the output arm is shorter than the input arm, then the output force is greater than the input force.

There are three classes of levers, as shown in **Figure 13**. The differences among the three classes of levers depend on the locations of the fulcrum, the input force, and the output force.

Figure 14 Levers are classified by the locations of the input force, the output force, and the fulcrum.

A The screwdriver is being used as a first-class lever. The fulcrum is the paint can rim.

First-Class Lever The screwdriver used to open the paint can in **Figure 14A** is an example of a first-class lever. For a first-class lever, the fulcrum is located between the input and output forces. The output force is always in the opposite direction to the input force in a first-class lever.

Second-Class Lever For a second-class lever, the output force is located between the input force and the fulcrum. Look at the wheelbarrow in **Figure 14B**. The girl applies an upward input force on the handles, and the wheel is the fulcrum. The output force is exerted between the input force and the fulcrum. For a second-class lever, the output force is always greater than the input force.

Third-Class Lever Many pieces of sports equipment, such as a baseball bat, are third-class levers. For a third-class lever, the input force is applied between the output force and the fulcrum. The right-handed batter in **Figure 14C** applies the input force with the right hand, and the left hand is the fulcrum. The output force is exerted by the bat above the right hand. The output force is always less than the input force in a third-class lever. Instead, the distance over which the output force is applied is increased.

Every lever can be placed in one of these classes. Each class can be found in your body, as shown in **Figure 15** on the next page.

B A wheelbarrow is a second-class lever. The fulcrum is the wheel.

C A baseball bat is a third-class lever. The fulcrum here is the batter's left hand.

Archimedes and the Lever

The Greek mathematician Archimedes (287–212 B.C.) described how a lever could be used to increase force. He also supposedly said “Give me a place to stand and I will move the Earth.” Research one of Archimedes’ inventions and write a paragraph describing it.

Quick Demo

Classifying Levers

Materials several different kinds of levers, such as crow bars, nut crackers, bottle openers, tweezers, fishing poles

Estimated Time ten minutes

Procedure Display several examples of each of the three classes of levers for students to examine and handle. First-class levers would be pliers, and crowbars. Second-class levers are nutcrackers, wheelbarrows, and bottle openers. Third-class levers are tweezers, baseball bats, and fishing poles. **L2** **LS** **Kinesthetic**

Use Science Words

Word Origin Have students look up the word *fulcrum* in a dictionary to determine its origin. Ask a volunteer to explain how the meaning of the word reflects its root. The word *fulcrum* comes from the Latin root *fulcire*, meaning “to support.” A fulcrum acts as a support around which a lever moves. **L1** **LS** **Linguistic**

Archimedes Although the lever had been used long before Archimedes, he was the first to demonstrate how the mechanical advantage of a lever depended on the distances of the input force and output force from the fulcrum. His work on levers led him to claim that if he had a place to stand, he could move the world. After making his famous claim, Archimedes was asked by King Hieron to demonstrate how he easily could move a heavy object. Archimedes devised a pulley system that allowed him to single-handedly drag a large, fully-loaded ship up onto the beach. His mathematical work included the first steps toward integral and differential calculus.

Differentiated Instruction

Challenge Have students create a computer presentation describing the three classes of levers. The description should include the locations of the fulcrum, input force, and output force. If possible, have students create an animated presentation to present to the class. **L3**

Cultural Diversity

Chinese Wheelbarrow The wheelbarrow, a second-class lever, was invented in China sometime in or before the first century B.C. The Chinese called their wheeled devices such things as wooden goat, wooden sheep, wooden ox, and gliding horse. How does a wheelbarrow give a worker more power? It allows the worker to do more work in a shorter amount of time. **L1** **LS** **Logical-Mathematical**

Visualizing Levers in the Human Body

Have students examine the pictures and read the captions. Then ask the following questions.

Newborn babies are not able to support their heads and they must be carefully supported. Why is this? *An unborn baby floats in fluid and does not have to support its own head. After birth, these muscles must be strengthened.*

Explain why your forearm becomes more muscular when you do curls with a dumbbell. When you increase the output force (the dumbbell), your input force (muscle in your forearm) must also increase. Repeating curls increases the muscle mass in your forearm over time.

Activity

Other Body Levers Find other levers in your body. Make a poster showing the various kinds that you find. For each example, mark the fulcrum, input force, and output force. **L2 LS Visual-Spatial**

Figure 15

All three types of levers—first-class, second-class, and third-class—are found in the human body. The forces exerted by muscles in your body can be increased by first-class and second-class levers, while third-class levers increase the range of movement of a body part. Examples of how the body uses levers to help it move are shown here.

- ▲ Fulcrum
- ▼ Input force
- ▲ Output force

▲ **FIRST-CLASS LEVER** The fulcrum lies between the input force and the output force. Your head acts like a first-class lever. Your neck muscles provide the input force to support the weight of your head.

◀ **SECOND-CLASS LEVER** The output force is between the fulcrum and the input force. Your foot becomes a second-class lever when you stand on your toes.

▶ **THIRD-CLASS LEVER** The input force is between the fulcrum and the output force. A third-class lever increases the range of motion of the output force. When you do a curl with a dumbbell, your forearm is a third-class lever.

Figure 16 A fixed pulley is another form of the lever.
Infer the lengths of the input arm and output arm in a pulley.

Ideal Mechanical Advantage of a Lever The ideal mechanical advantage, or *IMA*, for a lever can be calculated by dividing the length of the input arm by the length of the output arm:

IMA of a Lever

$$\text{ideal mechanical advantage} = \frac{\text{length of input arm (m)}}{\text{length of output arm (m)}}$$

$$IMA = \frac{L_{in}}{L_{out}}$$

Pulleys

A **pulley** is a grooved wheel with a rope, chain, or cable running along the groove. A fixed pulley, as shown in **Figure 16**, is a modified first-class lever. The axle of the pulley acts as the fulcrum. The two sides of the pulley are the input arm and output arm. A pulley can change the direction of the input force or increase the output force, depending on whether the pulley is fixed or movable. A system of pulleys can change the direction of the input force and make the output force larger.

Reading Check What are the input arm, output arm, and fulcrum of a pulley?

Fixed Pulleys The cable attached to an elevator passes over a fixed pulley at the top of the elevator shaft. A fixed pulley, such as the one in **Figure 17**, is attached to something that doesn't move, such as a ceiling or wall. Because a fixed pulley changes only the direction of force, the *IMA* is 1.

Figure 17 A fixed pulley changes only the direction of a force. You need to apply an input force of 4 N to lift the 4-N weight.

SECTION 3 Simple Machines 169

Activity

Calculate IMA Ask students to calculate the *IMA* of a lever whose output arm is 1 m long and whose input arm is 80 cm long. What class of lever is this? $IMA = 0.8 \text{ m} \div 1.0 \text{ m} = 0.8$; this must be a third-class lever. [L2]

IS Logical-Mathematical

Caption Answer

Figure 16 the radius of the pulley

Make a Model

Belt Pulleys Some pulleys, such as drive pulleys in automobiles, consist of two or more grooved wheels connected by a circular belt. Have students work in pairs to make models of a belt pulley. One student can hold two spools with pencils through the holes. Have students connect the spools with a large rubber band. The other student can turn the spools to show how turning one rotates the other in the same direction. If possible, use one small spool and one large spool. The students can see that the speed of the pulleys is inversely related to their diameter. [L3] **IS Kinesthetic**

Discussion

Fixed Pulleys The *IMA* of a single fixed pulley is 1. What is the benefit of using a fixed pulley? A fixed pulley allows a person to raise objects to high places while the person stays at ground level. [L2] **IS Logical-Mathematical**

Reading Check

Answer The input and output arms are the radius of the pulley; the fulcrum is the axle.

Visual Learning

Figure 16 Point out that a fixed pulley, like that shown in **Figure 16**, is a type of first-class lever because the fulcrum is between the input force and the output force. A movable pulley, like that shown on the next page, is a type of second-class lever. The point where the rope is attached to the ceiling is the fulcrum, and the output force is between the fulcrum and the input force. [L3] **IS Visual-Spatial**

Differentiated Instruction

Challenge Have students design and build a mousetrap using ramps, pulleys, and levers. If supplies are not available, they can draw their design on a poster and present it to the class. [L3]

✓ Reading Check

Answer by increasing the distance you must pull

Inquiry Lab

Finding Balance

Purpose Students infer how to include the mass of a lever into the input force.

Possible Materials meterstick, string, hanging weights (5 g, 10 g, 50 g, 100 g), vertical support, horizontal bar (to hang meter stick on)

Estimated Time 50 minutes

Procedure

1. Hang a meterstick about 10 cm off center and hang various combinations of weights on the two ends so that the meterstick balances.
2. Derive an equation to determine the exact location for any given combination of weights to make the stick remain balanced.

Teaching Strategy

Students should find that the heavier of the two weights will always be on the short side of the meterstick. They may even find the location for just one weight to balance the meterstick.

The equation is:

$$F_{in}d_{in} + W_s d_s = F_{out}d_{out}$$

Where W_s = weight of the meterstick and d_s = distance from the center of the meterstick to the fulcrum. [L2]

For additional inquiry activities, see *Science Inquiry Labs*.

Figure 18 A movable pulley and a pulley system called a block and tackle reduce the force needed to lift a weight.

A With a movable pulley, the attached side of the rope supports half of the 4-N weight. You have to apply a 2-N force to lift the weight.

B In a block-and-tackle system, the 4-N weight is divided equally among each supporting rope segment. In this case, four rope segments are supporting the weight. So you have to apply only a 1-N force to lift the weight.

Movable Pulleys A pulley in which one end of the rope is fixed and the wheel is free to move is called a movable pulley. Unlike a fixed pulley, a movable pulley does multiply force. Suppose a 4-N weight is hung from the movable pulley in **Figure 18A**. The ceiling acts like someone helping you to lift the weight. The rope attached to the ceiling will support half of the weight—2 N. You need to exert only the other half of the weight—2 N—to support and lift the weight. The output force exerted on the weight is 4 N, and the applied input force is 2 N. Therefore the *IMA* of the movable pulley is 2.

For a fixed pulley, the distance you pull the rope downward equals the distance the weight moves upward. For a movable pulley, the distance you pull the rope upward is twice the distance the weight moves upward.

✓ Reading Check

How does a movable pulley reduce the input force needed to lift a weight?

The Block and Tackle A system of pulleys consisting of fixed and movable pulleys is called a block and tackle. **Figure 18B** shows a block and tackle made up of two fixed pulleys and two movable pulleys. If a 4-N weight is suspended from the movable pulley, each rope segment supports one-fourth of the weight, reducing the input force to 1 N. The *IMA* of a pulley system is equal to the number of rope segments that support the weight. The block and tackle shown in **Figure 18B** has an *IMA* of 4. The *IMA* of a block and tackle can be increased by increasing the number of pulleys in the pulley system.

LAB DEMONSTRATION

Purpose to measure the mechanical advantage of various pulley systems

Materials one small, single-sheave pulley; two small, 2-ring tandem pulleys; cord; 1-kg mass; 10-N spring scale

Procedure Use a spring scale to measure

the forces required to lift a 1-kg mass using a single fixed pulley, then a single movable pulley, and finally, a block and tackle.

Expected Outcome The *IMAs* are, respectively, 1, 2, and 4.

Assessment

Which system(s) increased force? **movable pulley and block and tackle** Which system(s) changed direction of the force? **single fixed pulley and block and tackle** Which system(s) increased force and changed direction? **block and tackle** [L2]

Figure 19 The handle on a pencil sharpener is part of a wheel and axle. You apply a force to the handle. This force is made larger by the wheel and axle, making it easy to turn the sharpening mechanism.

Wheel and Axle

Could you use the pencil sharpener in **Figure 19** if the handle weren't attached? The handle on the pencil sharpener is part of a wheel and axle. A **wheel and axle** is a simple machine consisting of a shaft or axle attached to the center of a larger wheel, so that the wheel and axle rotate together. Doorknobs, screwdrivers, and faucet handles are examples of wheel and axles. Usually, the input force is applied to the wheel, and the output force is exerted by the axle.

Mechanical Advantage of a Wheel and Axle Recall that the mechanical advantage of a lever is the length of the input arm divided by the length of the output arm. A wheel and axle is another modified lever. The center of the axle is the fulcrum. The input force is applied at the rim of the wheel. So the length of the input arm is the radius of the wheel. The output force is exerted at the rim of the axle. So the length of the output arm is the radius of the axle. The *IMA* of a wheel and axle is:

IMA of a Wheel and Axle

$$\text{ideal mechanical advantage} = \frac{\text{radius of wheel (m)}}{\text{radius of axle (m)}}$$

$$IMA = \frac{r_w}{r_a}$$

According to this equation, the *IMA* of a wheel and axle can be increased by increasing the radius of the wheel.

Curriculum Connection

Math Supply students with several common wheels and axles, such as doorknobs or beaters from an electric mixer. Have them measure the radius of the wheel and the radius of the axle for each item and calculate its *IMA*. [L2] [IS] **Logical-Mathematical**

Differentiated Instruction

English-Language Learners Use visual aids to show students what simple machines look like. Then have students write descriptions of simple machines in their homes. Examples could be a lever, an inclined plane, and a pulley. [L2]

Text Question Answer

No, it would be difficult to turn the axle with your fingers.

Discussion

Lifting a Car A person uses a block and tackle to lift an automobile engine that weighs 1,800 N. The person must exert a force of 300 N to lift the engine. How many ropes support the engine? Explain how you know. Six; the *IMA* is $1,800 \text{ N} \div 300 \text{ N} = 6$, and in a pulley system, the *IMA* equals the number of supporting ropes. [L2]

IDENTIFYING

Misconceptions

Skating The wheel and axle on a skateboard or a pair of in-line skates is not the simple machine known as the wheel and axle. In the simple machine, the wheel and axle rotate together. Usually a small force is applied to the wheel and is translated to a larger force moving over the smaller distance of the axle. The wheels and axles on skateboards and in-line skates are rollers that help the vehicles move with less friction. The axle is fixed and the wheel rotates around the axle.

Reading Strategy

Double-Entry Notes Ask students to draw a line down the middle of their papers. On the left, have them write the name of a simple machine, such as lever, and draw a simple depiction under the name. On the right side, have them write the purpose and advantage of the simple machine. Students should repeat this note-making process for each simple machine.

Activity

Inclined Plane Create an inclined plane by resting a board against a stack of books. Have students measure the input and output distances and calculate the *IMA*. Then ask students to use a spring scale to measure the force required to lift a toy car vertically and the force required to drag it up the ramp. Have them use the numbers they measured for distance and force and calculate the amount of work done pulling the toy car along the ramp and lifting it vertically. Are the two amounts of work the same? Why or why not? **The two amounts of work should be close. Any difference is due to inaccurate measurements and loss of energy to friction.** [L2]

ELL **KS** Kinesthetic

Figure 20 If an input force is applied to the larger gear and it rotates clockwise, the smaller gear rotates counterclockwise. The output force exerted by the smaller gear is less than the input force applied to the larger gear.

Gears A gear is a wheel and axle with the wheel having teeth around its rim. When the teeth of two gears interlock, the turning of one gear causes the other gear to turn.

When two gears of different sizes are interlocked, they rotate at different rates. Each rotation of the larger gear causes the smaller gear to make more than one rotation. If the input force is applied to the larger gear, the output force exerted by the smaller gear is less than the input force.

Gears also may change the direction of the force, as shown in **Figure 20**. When

the larger gear is rotated clockwise, the smaller gear rotates counterclockwise.

Inclined Planes

Why do the roads and paths on mountains zigzag? Would it be easier to climb directly up a steep incline or walk a longer path gently sloped around the mountain? An **inclined plane** is a sloping surface, such as a ramp, that reduces the amount of force required to do work.

Mechanical Advantage of an Inclined Plane You do the same work by lifting a box straight up or pushing it up an inclined plane. By pushing the box up an inclined plane, however, the input force is exerted over a longer distance compared to lifting the box straight up. As a result, the input force is less than the force needed to lift the box straight upward. The *IMA* of an inclined plane can be calculated from the following equation:

IMA of an Inclined Plane

$$\text{ideal mechanical advantage} = \frac{\text{length of slope (m)}}{\text{height of slope (m)}}$$

$$\text{IMA} = \frac{l}{h}$$

The *IMA* of an inclined plane for a given height is increased by making the plane longer.

When you think of an inclined plane, you might think of moving an object up a ramp—you move and the inclined plane remains stationary. The screw and the wedge, however, are variations of the inclined plane in which the inclined plane moves and the object remains stationary.

ScienceOnline

Topic: Nanobots

Visit fl.gpscience.com for Web links to information about how tiny robots called nanobots might be used as microsurgical instruments.

Activity Use the information you find to make a diagram of a nanobot that might be used to perform surgery.

Visual Learning

Figure 20 Point out that the teeth on the gears must be the same size in order to rotate smoothly. Tell students that the ratio of the number of teeth on the gears determines the speed that the gears turn and the *IMA*. If the small gear has 24 teeth

and the large gear has 72 teeth, how much faster will the small gear turn? What is the *IMA*? **The large gear will make one-third of a turn for each full turn of the small gear, so the small gear will turn three times faster. The *IMA* is 3.** [L2] **KS** Logical-Mathematical

Figure 21 A screw has an inclined plane that wraps around the post of the screw.

The thread gets thinner farther from the post. This helps the screw force its way into materials.

The Screw

A **screw** is an inclined plane wrapped in a spiral around a cylindrical post. If you look closely at the screw in **Figure 21**, you'll see that the threads form a tiny ramp that runs upward from its tip. You apply the input force by turning the screw. The output force is exerted along the threads of the screw. The *IMA* of a screw is related to the spacing of the threads. The *IMA* is larger when the threads are closer together. However, when the *IMA* is larger, more turns of the screw are needed to drive it into a material.

How do you remove the lid from a jar of peanut butter, such as the one in **Figure 21**? If you look closely, you will see threads similar to the ones on the screw in **Figure 21**. Where else can you find examples of a screw?

The Wedge

Like the screw, the wedge is also a simple machine in which the inclined plane moves through an object or material. A **wedge** is an inclined plane with one or two sloping sides. It changes the direction of the input force.

Look closely at the knife in **Figure 22**. One edge is sharp, and it slopes outward at both sides, forming an inclined plane. As it moves through the apple, the downward input force is changed to a horizontal force, forcing the apple apart.

Many lids, such as those on peanut butter jars, also contain threads.

Figure 22 A knife blade is a wedge. As you cut through the apple, the blade pushes the halves of the apple apart.

Make a Model

Archimedes Screw An Archimedes' screw is a type of revolving screw used to lift water. This simple device was invented in the third century B.C. by the Greek scientist Archimedes. Have interested students make a model of an Archimedes' screw, using plastic sheeting attached to a dowel. L3

LS **Kinesthetic**

Teacher FYI

Screw Parts The threads of a screw are the windings. The pitch is the distance from a point on one thread to a point directly above it on the next thread. The pitch determines the force you must exert to turn a screw.

Text Question Answer

Other examples of a screw include an auger, a cork screw for opening wine bottles, and a spiral stair case.

Activity

Wedge IMA The ideal mechanical advantage of a wedge is calculated by dividing the length of one side of the wedge by the width of the wedge at the thick end. Ask students to calculate the mechanical advantage of a wedge that is 12 cm long and 5 cm wide. $MA = 12 \text{ cm} \div 5 \text{ cm} = 2.4$

L3 LS **Logical-Mathematical**

Fun Fact

In a compound machine, the output force of one of its simple machines becomes the input force of another. For a compound machine made of two simple machines, $MA = MA_2 \times MA_1$.

Active Reading

Write–Draw–Discuss This strategy encourages students to actively participate in reading and lectures, assimilating content creatively. Have students write about the different simple machines, clarify their ideas, and then make illustrations or drawings of the machines and how they work. Ask students to share responses with the class and display several examples. L2

Post Reading

Question a Partner Ask students to review what they have learned about simple machines. Then, have them question each other about a machine's purpose and advantages, as well as providing an example. Remind students to refer to their drawings and notes to form or answer questions.

3 Assess

DAILY INTERVENTION

Check for Understanding

Logical-Mathematical Have students brainstorm how to organize information about the six kinds of simple machines into a table. Include the type of machine, an example of each type, and a brief description of how it works. You may want to include other information such as mechanical advantage and efficiency. L2

Reteach

Arrows From construction paper, cut three arrows, about 10, 20, and 30 cm long. Make a similar set in another color. Label the first set of arrows F_{in} and the second set F_{out} . Collect examples of simple machines. Ask volunteers to choose a machine and use the arrows to show the direction and relative sizes of F_{in} and F_{out} . L2

ELL **Visual-Spatial**

Figure 23 A compound machine, such as a can opener, is made up of simple machines.

Compound Machines

Some of the machines you use every day are made up of several simple machines. Two or more simple machines that operate together form a **compound machine**.

Look at the can opener in **Figure 23**. To open the can, you first squeeze the handles together. The handles act as levers and increase the force applied on a wedge, which then pierces the can.

You then turn the handle, a wheel and axle, to open the can.

A car is also a compound machine. Burning fuel in the cylinders of the engine causes the pistons to move up and down. This up-and-down motion makes the crankshaft rotate. The force exerted by the rotating crankshaft is transmitted to the wheels through other parts of the car, such as the transmission and the differential. Both of these parts contain gears which can change the rate at which the wheels rotate, the force exerted by the wheels, and even reverse the direction of rotation.

section 3 review

Summary

The Lever Family

- A lever is a bar that is free to pivot about a fixed point called the fulcrum.
- There are three classes of levers based on the relative locations of the input force, the output force, and the fulcrum.
- A pulley is a grooved wheel with a rope, chain, or cable placed in the groove and is a modified form of a lever.
- The *IMA* of a lever is the length of the input arm divided by the length of the output arm.
- A wheel and axle consists of a shaft or axle attached to the center of a larger wheel.

The Inclined Plane Family

- An inclined plane is a ramp or sloping surface that reduces the force needed to do work.
- The *IMA* of an inclined plane is the length of the plane divided by the height of the plane.
- A screw consists of an inclined plane wrapped around a shaft.
- A wedge is an inclined plane that moves and can have one or two sloping surfaces.

Self Check

1. **Classify** a screwdriver being used to turn a screw as one of the six types of simple machines. Explain how the *IMA* of a screwdriver could be increased.
2. **Determine** for which class of lever the output force is always greater than the input force. For which class is the output force always less than the input force?
3. **Make a diagram** of a bicycle and label the parts of a bicycle that are simple machines.
4. **Think Critically** Use the law of conservation of energy to explain why, in a second-class lever, the distance over which the input force is applied is always greater than the distance over which the output force is applied.

Applying Math

5. **Calculate IMA** What is the *IMA* of a car's steering wheel if the wheel has a diameter of 40 cm and the shaft it's attached to has a diameter of 4 cm?
6. **Calculate Output Arm Length** A lever has an *IMA* of 4. If the length of the input arm is 1.0 m, what is the length of the output arm?
7. **Calculate IMA** A 6.0-m ramp runs from a sidewalk to a porch that is 2.0 m above the sidewalk. What is the ideal mechanical advantage of this ramp?

Assessment

Process Ask students to compare and contrast pulleys and gears. Both use wheels. Gears have teeth, but pulleys don't. Pulleys use a cord to move the wheels. Gears are pulled by interlocking teeth or a chain. L2

section 3 review

1. wheel and axle; by increasing the radius of the handle of the screwdriver
2. second-class lever; third-class lever
3. Check students' diagrams.
4. The input work cannot be greater than the output work. The input force is always less than the output force, so the input distance must be greater than the output distance.
5. $IMA = \frac{r_w}{r_a} = \frac{(40 \text{ cm})}{(4 \text{ cm})} = 10$
6. $L_{out} = \frac{(1.0 \text{ m})}{4} = 0.25 \text{ m}$
7. $IMA = \frac{1}{h} = \frac{(6.0 \text{ m})}{(2.0 \text{ m})} = 3$

Levers

Have you ever tried to balance a friend on a seesaw? If your friend was lighter, you had to move toward the fulcrum. In this lab, you will use the same method to measure the mass of a coin.

Real-World Problem

How can a lever be used to measure mass?

Goals

- **Measure** the lengths of the input arm and output arm of a lever.
- **Calculate** the ideal mechanical advantage of a lever.
- **Determine** the mass of a coin.

Materials

stiff cardboard, 3 cm by 30 cm
coins (one quarter, one dime, one nickel)
balance
metric ruler

Safety Precautions

Procedure

1. **Measure** the mass of each coin.
2. Mark a line 2 cm from one end of the cardboard strip. Label this line *Output*.
3. Slide the other end of the cardboard strip over the edge of a table until the strip begins to tip. Mark a line across the strip at the table edge and label this line *Input*.
4. **Measure** the mass of the strip to the nearest 0.1 g. Write this mass on the input line.
5. Center a dime on the output line. Slide the cardboard strip until it begins to tip. Mark the balance line. Label it *Fulcrum 1*.

6. **Measure** the lengths of the output and input arms to the nearest 0.1 cm.
7. Calculate the *IMA* of the lever. Multiply the *IMA* by the mass of the lever to find the approximate mass of the coin.
8. Repeat steps 5 through 7 with the nickel and the quarter. Mark the fulcrum line *Fulcrum 2* for the nickel and *Fulcrum 3* for the quarter.

Conclude and Apply

1. **Explain** why there might be a difference between the mass of each coin measured by the balance and the mass measured using the lever.
2. **Explain** what provides the input and output forces for the lever.
3. **Explain** why the *IMA* of the lever changes as the mass of the coin changes.

Communicating Your Data

Compare your results with those of other students in your class. **For more help, refer to the Science Skill Handbook.**

LAB 175

**BENCH
TESTED**

Real-World Problem

Purpose Students calculate the mechanical advantage of levers.

L1 LS Logical-Mathematical

Process Skills measure, use numbers, interpret data, classify, observe and infer, compare and contrast, recognize cause and effect, form operational definitions, interpret scientific illustrations

Time Required 40 minutes

Procedure

Teaching Strategies

- Be sure students understand how to use a balance to accurately get a mass of their coin.
- Some students may need help labeling their strips of cardboard.

Conclude and Apply

1. There will be some experimental error in this process.
2. The input force is the weight of the coin. The output force is the weight of the cardboard extended over the edge of the table.
3. because the input force changes with the changes in the weights of the coins

Communicating Your Data

Have students use graphics software to draw diagrams that explain the lab and illustrate their results.

Assessment

Oral Evaluate student understanding of the lever design by having them explain to the class how they performed the calculations. Use **Performance Assessment in the Science Classroom**, p. 101.

 Real-World Problem

Purpose Students will make models of different simple machines to lift a weight and compare the forces used. [L2]

COOP LEARN  **Kinesthetic**

Process Skills observe, use numbers, communicate, measure, infer, compare and contrast, recognize cause and effect, interpret data, formulate models, make and use tables

Time Required one class period

Materials The block and tackle can be difficult to set up unless the pulleys and string sizes are matched. The pulleys should be made for block and tackle use. The small pulleys typically available from hardware stores will work, but can be difficult to handle as they don't usually have the needed fastening points on both top and bottom. Be sure to arrange the double pulley and single pulley as illustrated.

Safety Precautions Be sure students wear eye protection for this lab.

Goals

- **Model** lifting devices based on a block and tackle and on an inclined plane.
- **Calculate** the output work that will be accomplished.
- **Measure** the force needed by each machine to lift a weight.
- **Calculate** the input work and efficiency for each model machine.
- **Select** the best machine for your job based on the force required.

Possible Materials

spring scale, 0–10 N range
9.8-N weight (1-kg mass)
double pulley
single pulley
string for the pulleys
stand or support for the pulleys
wooden board, 40 cm long
support for board, 10 cm high

Safety Precautions

USING SIMPLE MACHINES

 Real-World Problem

Suppose that you are the contractor on a one-story building with a large air conditioner. How can you get the air conditioner to the roof? How can you minimize the force needed to lift an object? What machines could you use? Consider a fixed pulley, a block and tackle system of pulleys, and an inclined plane. How can you find the efficiency of machines?

 Make a Model

1. Work in teams of at least two. **Collect** all the needed equipment.
2. Sketch a model for each lifting machine. Include a control in which the weight is lifted while being suspended directly from the spring scale. **Model** the inclined plane with a board 40-cm long and raised 10 cm at one end.
3. Make a data table like the one below.
4. Is the pulley support high enough that the block and tackle can lift a weight 10 cm?
5. Obtain your teacher's approval of your sketches and data table before proceeding.

Problem Data

	Control	Inclined Plane	Block and Tackle
Ideal Mechanical Advantage, IMA	1	4	3
Input force, F_{in} , N	Will vary	Will vary	Will vary
Input distance, d_{in} , m	0.10	0.40	0.30
Output force, F_{out} , N	9.8	9.8	9.8
Output distance, d_{out} , m	0.10	0.10	0.10
$Work_{in} = F_{in} d_{in}$, Joules	Will vary	Will vary	Will vary
$Work_{out} = F_{out} d_{out}$, Joules	0.98	0.98	0.98
$Efficiency = (Work_{out} / Work_{in}) \times 100\%$	Will vary	Will vary	Will vary

Using Scientific Methods

Test Your Model

1. Tie the weight to the spring scale and measure the force required to lift it. Record the input force in your data table under *Control*, along with the 10-cm input distance.
2. Assemble the inclined plane so that the weight can be pulled up the ramp at a constant rate. The 40-cm board should be supported so that one end is 10 cm higher than the other end.
3. Tie the string to the spring scale and measure the force required to move the weight up the ramp at a constant speed. Record this input force under *Inclined Plane* in your data table. Record 40 cm as the input distance for the inclined plane.
4. Assemble the block and tackle using one fixed double pulley and one movable single pulley.
5. Tie the weight to the single pulley and tie the spring scale to the string at the top of the upper double pulley.
6. **Measure** the force required to lift the weight with the block and tackle. Record this input force.
7. **Measure** the length of string that must be pulled to raise the weight 10 cm. Record this input distance.

Analyze Your Data

1. **Calculate** the output work for all three methods of lifting the 9.8-N weight a distance of 10 cm.
2. **Calculate** the input work and the efficiency for the control, the inclined plane, and the block and tackle.
3. **Compare** the efficiencies of each of the three methods of lifting.

Conclude and Apply

1. **Explain** how you might improve the efficiency of the machine in each case.
2. **Infer** what types of situations would require the use of a ramp over a pulley to help lift something.
3. **Infer** which machines would be most likely to be affected by friction.

Communicating Your Data

Make a poster showing how the best machine would be used to lift the air conditioner to the roof of the building.

LAB 177

Assessment

Process Have students make bar graphs of the different amounts of force used and work done using each machine. Use **Performance Assessment in the Science Classroom**, p. 111. [L2]

Communicating Your Data

Have students compare their posters. Did they all agree on the best machine? Display student posters in the classroom. [L2]

Make a Model

Possible Procedures If you don't have double pulleys, you can tie the string on the single pulley, as shown, and loop the string over a horizontal bar, then around the moveable pulley and then around the bar again instead.

Teaching Strategy Teams of two will be required to simplify assembly of apparatus and measurements.

Troubleshooting When students pull on the weight using the spring scale, make sure they pull slowly, smoothly, and at constant speed. Jerky pulling will lead to the use of unnecessarily large forces.

Test Your Model

Expected Outcome Students will build models of three simple machines and use them to model lifting an air conditioner to a roof. [L2]

Analyze Your Data

1. Output work is the same for all three, 0.98 J.
2. Answers will vary.
3. The block and tackle require the lowest force. The reason for the efficiency difference is probably the difference in the friction between the ramp and the block and tackle.

Conclude and Apply

1. You could improve both by lubricating the ramp and the pulleys.
2. Answers will vary.
3. Answers will vary. A slick ramp will be less affected by friction than a rusty pulley. A well-oiled pulley will work better than a rough-surfaced ramp.

Content Background

The current vision of nanotechnology and its possible uses was discussed in a book by Dr. K. Eric Drexler in 1986. He envisioned the precise construction of advanced materials from chemically pure ingredients, eliminating the toxic byproducts of conventional manufacturing. The long-term goals for molecular manufacturing range from ultra-small computers and space construction to the alleviation of disease, hunger and pollution. As developments increase at a rapid pace, many questions arise concerning the possible use and misuse of the new technology.

Discussion

Nanobots What would be the advantage of having nanobots perform medical tasks now done by drugs or surgery? **Possible answer:** By acting on a cell-by-cell basis nanobots can avoid damaging healthy cells and reduce recovery time. **L2** **LS**
Logical-Mathematical

Activity

Precision drawing Divide the class into groups of three or four. Assign a word to each group. Each group will use four different ways to spell out the word using sand on black paper, each time making the word as small as possible. The first time students put on gloves, the second time they will use their bare fingers to move the sand. For the third time, have them use an implement such as a craft stick to move the sand to make the word, and finally, provide students with tweezers and a magnifying glass. Ask students to compare their smallest word with 500 nanometers. **L2** **LS**
Kinesthetic

The Science of very, very small

Imagine an army of tiny robots, each no bigger than a bacterium swimming through your bloodstream.

Welcome to the world of nanotechnology, the science of creating molecular-sized machines. These machines are called nanobots.

This is the smallest guitar in the world. It is about as big as a human white blood cell. Each of its six silicon strings is 100 atoms wide. You can see the guitar only with an electron microscope.

The smallest of these machines are only billionths of a meter in size. They are so tiny that they can do work on the molecular scale.

Small, Smaller, Smallest

Nanotechnologists are predicting that within a few decades they will be creating nanobots that can do just about anything, as long as it's small. Already, nanotechnologists have built gears 10,000 times thinner than a human hair. They've also built tiny molecular "motors" only 50 atoms long. At Cornell University, nanotechnologists created the world's smallest guitar. It is approximately the size of a white blood cell and it even has six strings.

In the future, nanobots might transmit your internal vital signs to a nanocomputer implanted under your skin. There the data could be analyzed for signs of disease. Other nanomachines then could be sent to scrub your arteries clean of dangerous blockages, or mop up cancer cells, or even vaporize blood clots with tiny lasers. These are just some of the possibilities in the imaginations of those studying the new science of nanotechnology.

Design Think up a very small simple or complex machine that could go inside the body and do something. What would the machine do? Where would it go? Share your diagram or design with your classmates.

Design Provide time for students to give short presentations of their designs to the class. Ask each student to describe why the tiny machine would do the job better than current technology.

Resources for Teachers and Students

Engines of Creation by K. Eric Drexler, Garden City, N.Y.: Anchor Press/Doubleday, 1986

Nanotechnology: A Gentle Introduction to the Next Big Idea by Mark Ratner, Prentice Hall PTR, 2003

Reviewing Main Ideas

Section 1 Work

1. Work is the energy transferred when a force makes an object move.
2. Work is done only when a force produces motion in the direction of the force.
3. Power is the amount of work, or the amount of energy transferred, in a certain amount of time.

Section 2 Using Machines

1. A machine makes work easier by changing the size of the force applied, by increasing the distance an object is moved, or by changing the direction of the applied force.
2. The number of times a machine multiplies the force applied to it is the mechanical advantage of the machine. The actual mechanical advantage is always less than the ideal mechanical advantage.

3. The efficiency of a machine equals the output work divided by the input work.
4. Friction always causes the output work to be less than the input work, so no real machine can be 100 percent efficient.

Section 3 Simple Machines

1. A simple machine is a machine that can do work with a single movement.
2. A simple machine can increase an applied force, change its direction, or both.
3. A lever is a bar that is free to pivot about a fixed point called a fulcrum. A pulley is a grooved wheel with a rope running along the groove. A wheel and axle consists of two different-sized wheels that rotate together. An inclined plane is a sloping surface used to raise objects. The screw and the wedge are special types of inclined planes.
4. A combination of two or more simple machines is called a compound machine.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review how machines make doing work easier.

Interactive Tutor fl.gpscience.com

CHAPTER STUDY GUIDE 179

Identifying Misconceptions

After students have done the activity on page F and completed the chapter, have them answer the following question.

Julio lifted a box onto a desk. Joshua pushed an identical box up an inclined plane onto the desk. Friction on the inclined plane opposes Joshua's

push. Which boy probably used more force in lifting the boxes? **Julio** Which boy did more work? **They did about the same amount of work.**

Expected Outcome Students will see that simple machines may reduce the amount of force exerted; but not the work done. **L2**

Assess

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Directions: Carefully review the table and the diagram and answer the following questions.

Position	Input distance	Output distance	Effort force
A	40 cm	40 cm	20 N
B	40 cm	20 cm	10 N
C	40 cm	10 cm	5 N
D	40 cm	5 cm	?

1. According to this diagram and the table, which variable is being changed?
 A The fulcrum C The output force
 B The input distance D The output distance

2. If the data in the table remains the same, what input force is required to lift the object when the output distance is 5 cm?
 F 2 N G 2.5 N H 5 N J 10 N

3. Which hypothesis was probably tested by collecting these data?
 A The input force decreases as the input distance decreases.
 B The input force increases as the input distance decreases.
 C The input force decreases as the output distance decreases.
 D The input force increases as the output distance decreases.

L2

FOLDABLES

Have students use their Foldables to review the content of the chapter. Ask them to think of ways to improve the efficiency of the work they do without machines.

Using Vocabulary

SC.B.1.4.7

Using Vocabulary

compound machine p. 174	output force p. 162
efficiency p. 164	power p. 157
inclined plane p. 172	pulley p. 169
input force p. 162	screw p. 17
lever p. 166	simple machine p. 161
machine p. 160	wedge p. 17
mechanical advantage p. 164	wheel and axle p. 171
	work p. 154

Complete each statement using a word(s) from the vocabulary list above.

1. A combination of two or more simple machines is a(n) _____.
2. A wedge is another form of a(n) _____.
3. The ratio of the output force to the input force is the _____ of a machine.
4. A(n) _____ is a grooved wheel with a rope, chain, or cable in the groove.
5. The force exerted by a machine is the _____.
6. Energy is transferred when _____ is done.
7. _____ is the rate at which work is done or energy is transferred.

Checking Concepts

Choose the word or phrase that best answers the question.

8. Which of these is not done by a machine?
 - A) multiply force
 - B) multiply energy
 - C) change direction of a force
 - D) work
9. Which of the following increases as the efficiency of a machine increases?
 - A) work input
 - B) work output
 - C) friction
 - D) IMA
10. In an ideal machine, which of the following is true?
 - A) Work input is equal to work output.
 - B) Work input is greater than work output.
 - C) Work input is less than work output.
 - D) The IMA is always equal to one.
11. What simple machines make up a pair of scissors?
 - A) lever and pulley
 - B) pulley and wheel and axle
 - C) wedge and pulley
 - D) wedge and lever
12. What term indicates the number of times a machine multiplies the input force?
 - A) efficiency
 - B) power
 - C) mechanical advantage
 - D) resistance
13. How could you increase the IMA of an inclined plane?
 - A) increase its length
 - B) increase its height
 - C) decrease its length
 - D) make its surface smoother
14. What is the IMA of a screwdriver with a shaft radius of 3 mm and a handle radius of 10 mm?
 - A) 0.3
 - B) 3.3
 - C) 30
 - D) 13
15. What is the IMA of an inclined plane that is 2.1 m long and 0.7 m high?
 - A) 0.3
 - B) 2.8
 - C) 1.5
 - D) 3.0

Interpreting Graphics

16. Copy and complete the concept map of simple machines using the following terms: *compound machines, mechanical advantage, output force, work*.

Use the table below to answer questions 17 and 18.

Lever Input and Output Arms

Lever	Input Arm (cm)	Output Arm (cm)
A	25	75
B	53	42
C	36	36
D	32	99
E	10	30

17. **Determine** which of the levers listed in the table above has the largest *IMA*.
18. **Calculate** An input force of 50 N is applied to lever B. If the lever is 100 percent efficient, what is the output force?

Thinking Critically

19. **Describe** how the input force, output force, and fulcrum should be arranged so that a child can lift an adult using his own body weight on a seesaw.

20. **Determine** what arrangement of movable and fixed pulleys would give a mechanical advantage of 3.
21. **Explain** which would give the best mechanical advantage for driving a screw down into a board: a screwdriver with a long, thin handle, or a screwdriver with a short, thick handle.

Applying Math

22. **Calculate Work** Find the work needed to lift a 20.0-N book 2.0 m.
23. **Calculate Axle Radius** A doorknob has an *IMA* equal to 8.5. If the diameter of the doorknob is 8.0 cm, what is the radius of the shaft the doorknob is connected to?
24. **Calculate Input Work** A machine has an efficiency of 61 percent. Find the input work if the output work is 140 J.
25. **Calculate Efficiency** Using a ramp 6 m long, workers apply an input force of 1,250 N to move a 2,000-N crate onto a platform 2 m high. What is the efficiency of the ramp?

26. **Calculate Power** A person weighing 500 N climbs 3 m. How much power is needed to make the climb in 5 s?

Thinking Critically

19. The fulcrum should be moved toward the adult to increase the length of the input arm of the child's lever. This will multiply the input force exerted by the child.
20. A fixed double pulley with a moveable single will give $MA = 3$. Tie the string to the moveable pulley and loop it first through the lower pulley on the fixed double pulley, then through the single, moveable, and finally over the top double pulley. This gives three supporting strings.
21. The one with the fat handle; the screwdriver is being used as a wheel and axle, with the handle acting as the wheel. The screwdriver with the fat handle will therefore have a greater *MA*. The length does not matter.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.2

22. 40 J
23. 0.47 cm
24. 230 J
25. 53%
26. 300 W

Multiple Choice

Gridded Response

Go On

SAMPLE

Multiple Choice

- 1. B
- 2. B
- 3. C
- 4. D
- 5. D
- 6. C

Gridded Response

- 7. 23N
- 8. 1.9 J

Record your answers on the answer sheet provided by your teacher or on a sheet of paper. The assessed Florida Benchmark appears above the question.

Multiple Choice

Use the figure below to answer questions 1 and 2.

- 1. The figure above shows a doorknob with a radius of 4.8 cm and a mechanical advantage of 4.0. What is the radius of the inner rod that connects the knob to the door?
A. 0.6 cm
B. 1.2 cm
C. 1.8 cm
D. 2.4 cm
- 2. What would happen to the mechanical advantage if the radius of the doorknob were doubled?
A. It would be multiplied by 4.
B. It would be multiplied by 2.
C. It would be divided by 4.
D. It would be divided by 2.
- 3. A ramp is 2.8 m long and 1.2 m high. How much power is needed to push a box up the ramp in 4.6 s with a force of 96 N?
A. 21 W
B. 25 W
C. 58 W
D. 270 W

- 4. How much work is done in lifting a 9.10-kg box onto a shelf 1.80 m high?
A. 5.06 J
B. 16.4 J
C. 49.5 J
D. 161 J
- 5. An input force of 80 N is used to lift an object weighing 240 N with a system of pulleys. How far down must the rope around the pulleys be pulled to lift the object a distance of 1.4 m?
A. 0.47 m
B. 1.4 m
C. 2.8 m
D. 4.2 m

Use the figure below to answer questions 6 and 7.

- 6. If a lever's input arm is 8 cm and its output arm is 24 cm, what is the ideal mechanical advantage of the lever?
A. 4
B. 3
C. 0.33
D. 0.25

Short Response

- 9. 4
- 10. 5 N

Gridded Response

7. How much more work is done to push a box 2.5 m with a force of 30 N than to push a box 2.0 m with a force of 26 N?
8. As you throw a ball, you exert a force of 4.2 N on the ball. You exert this force on the ball while the ball moves a distance of 0.45 m. The ball leaves your hand and travels a horizontal distance of 8.5 m to your friend. How much work have you done on the ball?

Short Response

Use the illustration below to answer questions 9 and 10.

9. What is the ideal mechanical advantage of the pulley system shown in the figure above?
10. If the block supported by the pulley system has a weight of 20 N, what is the input force on the rope?

Extended Response

SC.B.1.4.7

11. Use the law of conservation of energy to explain why it is impossible for the output work of a machine to be greater than the machine's input work.

Use the illustration below to answer question 12.

12. The boy in the figure below is carrying a box to the top of the stairs.

PART A Describe how the work that the boy does on the box is related to the energy transfer that occurs. How does the energy of the box change form as the boy carries the box up the stairs?

PART B Explain how the work, power, and energy would change if the boy walked faster. How would the work, power, and energy change if the steps were the same height but steeper?

Test-Taking Tip

Don't Panic Stay calm during the test. If you feel yourself getting nervous, close your eyes and take five slow, deep breaths.

11. When work is done on the machine, energy is transferred to the machine. When the machine does work, energy is transferred from the machine. If energy cannot be created, then the output work cannot be greater than the input work.

12. Part A. The chemical energy from the boy's muscles is converted to potential energy of the box. The potential energy of the box increases as the boy increases the height of the box.

12. Part B. Work would be the same. Power would increase because the time required to do the work decreased. The energy change of the box would be the same.

Section Focus

Section Focus Transparency **Aurora B. Moves South** **7**

Most of the time, the Aurora borealis shows a brilliant, swirling, green light. People located close to or within the Arctic Circle, the northernmost part of the Earth's surface, can experience these colorful swirls or ribbons of light. The lights are created when charged particles that are spiraling along the Earth's magnetic field hit atoms, setting them off to give off light.

When you think the aurora shows, it can't be seen by people located south of the Arctic Circle!

What would happen if we saw winds if it didn't show a magnetic field around it?

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

 Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Hands-on Activities

Student Text Lab Worksheet

Comparing the Angle of Sunlight to Intensity

Grade 8 Science

Unit 1: Earth and Space Science

Lesson 1: The Sun's Energy

Lab Overview

Duration: 45 minutes

Materials:

- Protractor
- Compass
- String
- Scissors
- Index cards
- Markers

Objectives:

- Students will understand the relationship between the angle of sunlight and its intensity.
- Students will be able to create a model of the Earth's tilt and how it affects the angle of sunlight.

Standards:

- 8-ESS2-1: Understand patterns of motion in the sky.
- 8-ESS2-2: Understand the forces that shape Earth's surface.

Procedure:

1. Students will be divided into groups of four.
2. Each group will be given a protractor, compass, string, scissors, index cards, and markers.
3. The teacher will demonstrate how to create a model of the Earth's tilt.
4. Students will follow the steps to create their own models.
5. Each group will present their model to the class.
6. The teacher will facilitate a discussion about the relationship between the angle of sunlight and its intensity.

Lab Overview

Duration: 45 minutes

Materials:

- Protractor
- Compass
- String
- Scissors
- Index cards
- Markers

Objectives:

- Students will understand the relationship between the angle of sunlight and its intensity.
- Students will be able to create a model of the Earth's tilt and how it affects the angle of sunlight.

Standards:

- 8-ESS2-1: Understand patterns of motion in the sky.
- 8-ESS2-2: Understand the forces that shape Earth's surface.

Procedure:

1. Students will be divided into groups of four.
2. Each group will be given a protractor, compass, string, scissors, index cards, and markers.
3. The teacher will demonstrate how to create a model of the Earth's tilt.
4. Students will follow the steps to create their own models.
5. Each group will present their model to the class.
6. The teacher will facilitate a discussion about the relationship between the angle of sunlight and its intensity.

Laboratory Activities

L2

How to Measure the Circumference of Earth

Laboratory Activity

Objectives:

1. Calculate the circumference of Earth.
2. Compare the calculated circumference with the actual circumference.

Materials:

- String
- Ruler
- Protractor
- Compass
- Pencil
- Scissors
- Index card
- Cardstock
- Glue
- Markers
- Calculator

Procedure:

1. Cut a piece of string about 1 meter long.
2. Tie one end of the string to a small object, such as a paper clip or a key.
3. Hold the other end of the string taut against a wall or a large board.
4. Move the string along the surface, keeping it straight and touching the surface at all points.
5. When you reach the other end, mark the point where the string ends.
6. Measure the distance between the two points with a ruler.
7. Record the measurement.
8. Repeat steps 1 through 7 several times, each time using a different length of string.
9. Calculate the average of your measurements.
10. Compare your average measurement to the actual circumference of Earth (approximately 40,075 km).

Conclusion:

Your calculated circumference should be close to the actual circumference of Earth. This activity demonstrates how ancient civilizations used simple tools to measure the size of the world.

Chapter Tests

[illegible]

Science Content Background

section**Earth in Space**

1

Earth's Magnetic Field

Convection currents of molten iron deep in Earth's core, along with Earth's rotation, produce huge electrical currents. These electrical currents cause Earth's magnetic field.

The orientation of the direction of Earth's magnetic field changes periodically over time. In the past, the direction of Earth's magnetic field has been north-south, as it is now. At other times, the direction has been south-north. This is one bit of evidence supporting the theories of sea-floor spreading and plate tectonics.

Recent evidence suggests that Earth's inner, solid core is rotating slightly faster than the rest of the planet. The rate of increase is such that the inner core completes one extra quarter turn in 100 years. In fact, the orientation of Earth's solid inner core has shifted about 20 km during the past 30 years, equivalent to a motion that is a million times faster than the motion of continents at Earth's surface due to plate tectonics.

A better understanding of the outer core-inner core boundary will help scientists understand how the inner core is growing as Earth cools, how the outer core continues to solidify, and how the interaction of these two layers helps to produce Earth's magnetic field.

section**Time and Seasons**

2

Why do seasons change?

Earth's seasons result from the fact that Earth always tilts in the same direction as it revolves around the Sun. This constant tilt of 23.5 degrees means that sunlight strikes different locations on Earth at different angles throughout the year, and that there are more hours of daylight in some areas, and fewer hours of daylight in others.

section**Earth's Moon**

3

Craters, Maria, and Mountains

About 3.9 billion years ago, large meteorites created huge impact basins on the Moon's surface. By 3.2 billion years ago, lava flows had filled in these impact basins forming the large, relatively flat, dark maria seen today. Craters have formed on the maria and other areas of the Moon's surface since, but its surface looks much as it did 3.2 billion years ago. Fewer maria formed on the Moon's far side because the crust is thicker on that side, making it harder for lava to reach the surface.

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that...

- Sunlight strikes Earth indirectly at some times during the year, causing seasonal changes.

A common misconception is that the sunlight that falls on Earth during the summer is more direct than the sunlight that falls on Earth during other seasons. In reality, the Sun's rays that strike Earth are always direct, no matter what season it is. This misconception comes about because of the misuse of the word *direct*.

Discussion

Organize the class into groups, and have them work together to define the words *direct* and *indirect* as they are used in other subjects. Possible answer: When the bus takes the most direct route to school, it travels on only one street. However, when it takes an indirect route, it travels down several side streets on its way to school. Similarly, the Sun's rays follow a straight line.

Promote Understanding

Demonstration

Have two students help with the demonstration. Provide each student with a meterstick and chalk.

- Shine light from the overhead projector perpendicularly on the chalkboard. Have one student measure the length and width of the lighted square and ask students to calculate the area of the lighted square.
- Shine light from the overhead projector so that it strikes the chalkboard at 45° . Have another student measure the length and width of this rectangular area of light. Have students calculate the area of the lighted rectangle.
- Ask students to compare the areas of the two lighted areas. Emphasize that light from the projector covered more area when striking the chalkboard at the lower angle. Relate this to the fact that light from the Sun covers a larger area when striking Earth's surface at angles other than vertical. Thus, Earth's surface receives less light and heat per unit area.

Assess

After completing the chapter, see *Identifying Misconceptions* in the Study Guide at the end of the chapter.

The Earth-Moon-Sun System

chapter preview

sections

- 1 Earth in Space
- 2 Time and Seasons
Lab: Comparing the Angle of Sunlight to Intensity
- 3 Earth's Moon
Lab: Identifying the Moon's Surface Features and Apollo Landing Sites

Are there tides in a desert?

Did you know the Moon exerts gravitational force on Earth? On Earth, the Moon's gravitational attraction is evidenced as tides in oceans and seas. Even in the desert, the Moon's gravity influences the flexing of tectonic plates.

Science Journal Research to discover what landforms or events are affected by the Moon's gravitational force on Earth.

184

Theme Connection

Systems and Interactions The day-night cycle on Earth and its seasons are caused by Earth's rotation and revolution. Interactions among the Earth-Moon-Sun system set up conditions that produce the different phases of the Moon and eclipses of the Sun and the Moon. Tides on Earth also are produced by interactions among the Earth-Moon-Sun system.

About the Photo

Swaying Cactus? You can watch tides come and go under swaying palms along the beach. But, this saguaro cactus stands motionless under a crescent moon in Kofa National Wildlife Refuge in Arizona. Scientists study the Earth-Moon-Sun system to discover possible effects on plate tectonics. It is unknown whether the Moon's gravitational influence triggers some earthquakes.

Start-Up Activities

Relative Sizes of Earth, the Moon, and the Sun

Can you picture the relative sizes of Earth, the Moon, and the Sun? Earth is about four times larger than the Moon in diameter, but the Sun is much larger than either. The Sun's diameter is about 100 times that of Earth and about 400 times that of the Moon. In this Lab, you'll investigate the relative sizes of all three objects.

1. Get permission to draw some circles on a sidewalk or paved area with chalk. You could also use a stick to draw circles on a dirt playing field.
2. Select a scale that will enable you to draw circles that will represent each object.
Hint: Using 1 cm for the Moon's diameter is a good start.
3. Use a meterstick to draw a circle with a 1-cm diameter for the Moon.
4. Now draw two more circles to represent Earth and the Sun.
5. **Think Critically** In your Science Journal, explain how the Moon and the Sun can appear to be about the same size in the sky. Think about how things look smaller the farther they are from you.

FOLDABLES[™] Study Organizer

Earth, Sun, and Moon Make the following Foldable to help organize what you learn about the Earth-Moon-Sun system.

- STEP 1** Fold a sheet of paper vertically from side to side. Make the front edge about $\frac{1}{2}$ inch longer than the back edge.

- STEP 2** Turn lengthwise and fold into thirds.

- STEP 3** Unfold and cut only the top layer along both folds to make three tabs.

- STEP 4** Label each tab.

Questions As you read the chapter, write what you learn about each body under the correct tab of your Foldable. After you read the chapter, note the many ways that the three affect each other.

Science online

Preview this chapter's content and activities at glencoe.com

Purpose Use this Launch Lab to introduce students to the relative sizes of Earth, the Moon, and the Sun. Students will model the relative sizes of these bodies. **L2**

Preparation Locate a sidewalk or other paved area for the lab and obtain permission to draw on it with chalk.

Materials chalk, meterstick, metric ruler

Alternate Materials stick

Teaching Strategy Encourage students to select a size for the Moon. If no one does, or if the size selected is too large, suggest a 1-cm radius for the Moon.

Troubleshooting Draw the representative circles ahead of time to be sure all will fit on the section of sidewalk that is selected.

Safety Precautions

- Select a site near the school that is away from traffic.
- Caution students to be on the lookout for cars that might cross the sidewalk.

Think Critically

The Moon can appear the same size as the Sun because it is much closer. Tell students that the Sun is about 400 times farther from Earth than the Moon. Ask them how much larger the Sun must be, about 400 times

Assessment

Process Students can model the relative positions and sizes of the Moon and Sun by closing one eye and using their thumbs to block their view of a classmate. The thumb can completely block the view of a classmate if it is held close enough.

**Dinah Zike
Study Fold**

Student preparation materials for this Foldable are available in the Chapter **FAST FILE** Resources.

Section Focus Transparency Aurora B. Moves South Chapter 7

Most of the time, the aurora borealis, shown below, can only be seen by people located close to or within the Arctic Circle. Occasionally, people located further south can experience these curtains or ribbons of lights. The lights are created when charged particles that are spiraling along the Earth's magnetic field lines (see inset) bump into particles in the Earth's atmosphere, emitting various colors of light.

1. When do you think the aurora borealis can be seen by people located south of the Arctic Circle?
2. What would happen to solar winds if Earth did not have a magnetic field around it?

L2

Earth's Unique Properties Tell students that every planet in the solar system has unique physical properties. Ask students to brainstorm about unique properties of Earth that make it possible for life to exist. Start them out by writing, "Earth has oceans" on the board. Accept other student responses. L2

Predict The new vocabulary words for this section may be familiar to students in an everyday sense. Ask students to share what they know about each word with a partner. Then have students seek out the physics definition in the text.

Reading Guide

What You'll Learn

- Compare and contrast Earth's physical characteristics with those of other planets.
- Explain Earth's magnetic field.
- Describe Earth's movement in space and how eclipses occur.

Why It's Important

Gravity from the Earth-Moon-Sun system directly affects what it's like to live here on Earth.

Review Vocabulary

orbit: curved path of one object, such as the Moon, around another object, such as Earth

New Vocabulary

- sphere
- ellipse
- gravity

Figure 1 Objects fall toward Earth's center.

Infer How would apples fall from trees if Earth were shaped like a cube?

Earth's Size and Shape

Like most people, you are aware that Earth is round like a ball. But can you prove that this is true? If you jump up, you know that you'll come back down, but why is this so? What is the force that brings you down? You may have used a compass to tell directions, but do you know how a compass works? You will learn the answers to these questions and also about many physical characteristics of Earth in this section.

Ancient Measurements Earth's shape is similar to a sphere. A **sphere** is a round, three-dimensional object, the surface of which is the same distance from the center in all directions. Even ancient astronomers knew that Earth is spherical in shape. We have pictures of Earth from space that show us that it is spherical, but how could astronomers from long ago have learned this? They used evidence from observations.

Aristotle was one of these early astronomers. He made three different observations that indicated that Earth's shape is spherical. First, as shown in **Figure 1**, no matter where you are on Earth, objects fall straight down to the surface, as if they are falling toward the center of a sphere. Second, Earth's shadow on the Moon during a lunar eclipse is always curved. If Earth weren't spherical, this might not always be the case. For example, a flat disk casts a straight-edged shadow sometimes. Finally, people in different parts of the world see different stars above their horizons. More specifically, the pole star Polaris is lower in the sky at some locations on Earth than at others.

Everyday Evidence of Earth's Shape What have you seen, other than pictures from space, that indicates Earth's shape? Think about walking toward someone over a hill. First, you see the top of the person's head, and then you can see more and more of that person. Similarly, if you sail toward a lighthouse, you first see the top of the lighthouse and then see more and more of it as you move over Earth's curved surface.

You can see other evidence, too. Just like ancient astronomers, you can see for yourself that objects always fall straight down. Today, however, we know more about gravity. **Gravity** is the attractive force between two objects that depends on the masses of the objects and the distance between them. Astronomers think Earth formed by the accumulation of infalling objects toward a central mass. Energy released in the impacts kept the growing Earth molten. Gravity caused it to form into the most stable shape, a sphere. In this shape, the pull of gravity toward the center of the planet is the same in all directions. If a planet is massive enough, the pull of gravity could be so strong that even tall mountains would collapse under their own weight. **Table 1** lists some of Earth's other properties.

Reading Check How does the pull of gravity indicate that Earth's shape is spherical?

Table 1 Earth's Physical Properties

Diameter (pole to pole)	12,714 km
Diameter (through equator)	12,756 km
Circumference (poles)	40,008 km
Circumference (equator)	40,075 km
Mass	5.98×10^{24} kg
Average density	5.52 g/cm ³
Average distance to the Sun	149,600,000 km
Average distance to the Moon	384,400 km
Period of rotation	23 h, 56 min
Period of revolution	365 days, 6 h, 9 min

Caption Answer

Figure 1 at an angle

Reading Check

Answer All objects affected by Earth's gravity tend to fall toward the center of the planet.

 Quick Demo
Earth's Shadow is Round

Materials Earth globe, jar lid, 2 flashlights

Estimated Time 5 minutes

Procedure Have one student hold a globe or large ball about 3 m from the wall. Have another student hold the jar lid at the same distance. Shine the flashlights on both the Earth globe and on the jar lid so the shadows fall on the wall. Have the students slowly rotate the globe and the jar lid. Which object always casts a round shadow, no matter how it is held? **the globe**

Visual Learning

Table 1 Ask students to explain how they can tell Earth is not a perfect sphere from the information presented in **Table 1**. Students should note that measurements of Earth's diameter and circumference are different if measured at the poles or at the equator. They should explain that a perfect sphere would have the same measurements in each direction.

 Reading Strategy

Causal Relationships Have students identify cause and effect relationships for concepts in this section. For instance, gravity may have caused objects in space to pull together and eventually form the spherical shape that earth possesses. Another idea might involve earth's magnetic field causing the auroras.

Cultural Diversity

Arab Astronomers After about 620 A.D. the Islamic religion spread from Arabia into Egypt, Mesopotamia (Iraq), and Syria. In this religion, it is necessary to have accurate readings of time and direction to follow the Koran concerning daily prayer and worship. Astronomy was crucial to the teachings of Islam. A very useful handbook of astronomical tables, called the *Zij*, was developed in Baghdad, and this city became the first major

center of Islamic science. Persian poet Omar Khayyam was also an astronomer and mathematician who corrected the Islamic calendar. Have students research the history and importance of contributions of Arab astronomers to the study of astronomy during the Renaissance. **When Constantinople fell, eastern scholars headed to Europe carrying knowledge that helped begin the European Renaissance after the Dark Ages.**

Van Allen Belts Earth's magnetosphere traps charged particles of the solar wind from the Sun, thus protecting Earth's surface. The magnetosphere contains two belts of high-energy, charged particles, the Van Allen belts—one lies about 3,000 km and the other about 20,000 km above Earth's surface.

Research Are the Van Allen belts hazardous to humans? **Possible answer:** The highly charged particles in the Van Allen belts are hazardous to humans and must be shielded to protect astronauts. Without shielding, living organisms and delicate instruments would be subjected to high energy discharge if they come in contact with the charged particles. For this reason, the *International Space Station* is located below the Van Allen belts.

Caption Answer

Figure 2 The shapes follow Earth's magnetic field lines.

Discussion

Planet Earth Remind students that Earth has many forms of life. **What characteristics of Earth make it possible for life to exist?** **Possible answer:** Earth's atmosphere moderates temperatures and provides oxygen to breathe. [L2]

Van Allen Belts The magnetosphere lies above the outer layers of Earth's atmosphere. Within this magnetosphere are belts of charged particles known as the Van Allen belts. They contain thin plasma composed of protons (inner belt) and electrons (outer belt) that are trapped by Earth's magnetic field. Research how the magnetosphere protects Earth from the solar wind and why the Van Allen belts are hazardous to astronauts and satellites. Report your findings to the class.

Figure 2 Like a common bar magnet, Earth also has north and south magnetic poles. The inner and outer gold shells respectively represent the positive and negative Van Allen Belts.

Explain why the Van Allen Belts are shaped as they are.

Earth's Magnetic Field

Earth has a magnetic field that protects us from harmful radiation from the Sun. Scientists hypothesize that Earth's rotation and movement of matter in the core set up a strong magnetic field in and around Earth. This field resembles that surrounding a bar magnet, shown in **Figure 2**. Earth's magnetic field is concentrated at two ends of an imaginary magnetic axis running from Earth's north magnetic pole to its south magnetic pole. This axis is tilted about 11.5° from Earth's geographic axis of rotation.

Wandering Poles The locations of Earth's magnetic poles change slowly over time. Large-scale movements, called polar wandering, are thought to be caused by movements in Earth's crust and upper mantle. The magnetic north pole is carefully remapped periodically to pinpoint its location.

The Aurora An area within Earth's magnetic field, called the magnetosphere, deflects harmful radiation coming from the Sun, a stream of particles called solar wind. Some of these ejected particles from the Sun produce other charged particles in Earth's outer atmosphere. These charged particles spiral along Earth's magnetic field lines toward Earth's magnetic poles. There they collide with atoms in the atmosphere. These collisions cause the atoms to emit light. This light is called the aurora borealis (northern lights) in the northern hemisphere and the aurora australis (southern lights) in the southern hemisphere.

Earth Orbits the Sun

Earth orbits the Sun at an average distance of 149,600,000 km. Its orbit, like those of all the planets, moons, asteroids, and many comets, is shaped like an ellipse. An **ellipse** is an elongated, closed curve with two foci. The Sun is not located at the center of the ellipse, but at one of its two foci. This means the distance from Earth to the Sun varies during the year. Earth is closest to the Sun—about 147 million km away—around January 3 and is farthest from the Sun—about 152 million km away—around July 4 of each year.

Curriculum Connection

Geography Show students a map that includes the directions of geographic (rotational) and magnetic north. This is called the declination of the map. Ask them to determine the number of degrees east or west they would have to measure from magnetic north in order to find the geographic North Pole. **If magnetic north is east, they must subtract that number of degrees, if it is west, they must add.** [L2] [ELL] [LS] **Visual-Spatial**

Differentiated Instruction

Learning Disabled To help students understand how to use the two north directions on a map, have the student look at a desk forward but to their right and then to the front of the room. Ask them how far they have to turn their heads in order for to look at the front of the room again. Relate this to the difference between the two norths. [L2] [ELL] [LS] **Visual-Spatial**

Earth as a Planet Earth is a planet, just as Venus, Mars, and Jupiter are planets. However, Earth is the only planet whose characteristics make it possible for life as we know it to survive.

Earth resembles Venus more than any other planet. Earth and Venus are nearly the same size, and both have atmospheres that contain carbon dioxide, although in greatly different amounts. Earth's oceans, shown in **Figure 3**, absorbed much of the carbon dioxide in Earth's early atmosphere. Also, Venus's atmosphere is much denser than Earth's, with pressures as high as those encountered by submarines in Earth's oceans at depth of 900 m.

Another difference is the surface temperatures. On Earth, you can walk outside and feel how cold or warm it is. However, temperature on Venus is over 450°C. This high temperature is caused by the large amount of carbon dioxide in Venus's atmosphere, which traps heat energy and prevents it from escaping. Think about what life on Earth might be like with more carbon dioxide in the atmosphere.

Reading Check What feature of Earth's surface has led to such a difference between Earth and Venus?

Although Mars is almost half the size of Earth, its surface gravitational pull is less than two-fifths that of Earth's. Yet conditions there are more like those on Earth than any other planet in the solar system. Mars may even have frozen water near its surface. Mercury is very different from Earth; it has no atmosphere, and is cratered like Earth's moon.

Figure 3 By absorbing carbon dioxide, oceans protect Earth from experiencing a greenhouse effect like that on Venus.

Reading Check

Answer oceans

Post Reading

Illustration Ask students to create an illustration that incorporates the major ideas found in this section. Remind students to include detailed information about Earth's shape, magnetic field, orbit, and atmosphere. Share the illustrations in a class booklet.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students draw a diagram of Earth orbiting the Sun. Have them add the orbits of Mercury, Venus, and Mars to their drawings. **L1 ELL P**

Reteach

Planet Surfaces Show students photographs of the surfaces of Mercury and Earth's moon. Ask them to list ways in which the two objects are similar. **Possible answer:** both are covered with craters and both lack color. **L1 ELL**

Assessment

Performance Provide students with 3 × 5 cards and ask them to make flash cards for the terrestrial planets. The name of the planet should be written on one side and important characteristics on the other side. Have them quiz each other on the planet characteristics using the completed cards. **L2 ELL**

section 1 review

Summary

Earth's Size and Shape

- Earth has a spherical shape.
- Gravity causes very large objects in space to form spheres.

Earth's Magnetic Field

- Earth's magnetic field protects life on Earth's surface from harmful radiation.
- Interaction of the solar wind with Earth's magnetic field produces the aurora.

Earth Orbits the Sun

- Earth orbits the Sun in an elliptical orbit.
- Earth and Venus are similar in size, and both have atmospheres that contain carbon dioxide.

Self Check

1. **Identify** two pieces of evidence that prove Earth's spherical shape.
2. **Define** the term *gravity*.
3. **Explain** what produces Earth's magnetic field.
4. **Describe** how Venus and Earth are similar.
5. **Think Critically** Evidence indicates that Mars once had liquid water on its surface. Discuss some possible reasons why it has none today.

Applying Math

6. **Calculate Speed** Earth's circumference at the equator is 40,075 km. If it spins once each day, what is the speed of spinning in km/h?

More Section Review fl.gpscience.com

To take advantage of the nonstop energy provided by the Sun, some utility companies have developed solar power plants, like the one shown below. These plants rely on solar panels that are precisely oriented to capture as much of the Sun's energy as possible at any given time of the year.

1. In which direction would the panels need to face if located in the northern hemisphere? The southern hemisphere?

2. How would panels in the northern hemisphere need to be adjusted during the year to capture as much of the Sun's energy as possible?

L2

Reading Guide

What You'll Learn

- **Calculate** the time and date in different time zones.
- **Differentiate** between revolution and rotation.
- **Discuss** what causes seasons to change.

Why It's Important

Days and years are measurements of Earth's movements.

Review Vocabulary

latitude: angular distance north or south of Earth's equator

New Vocabulary

- time zone
- rotation
- revolution
- ecliptic
- equinox
- solstice

Measuring Time on Earth

People can determine the approximate time of day by determining where the Sun is in the sky. If the Sun is near an imaginary line drawn from due north to due south, it is about 12:00 noon. Humans have used movements of Earth, the Moon, and the Sun to measure time for thousands of years.

Around 3000 B.C., the Babylonians devised a method of timekeeping using their counting methods, which were based on 60. They noticed that the Sun appeared to take a circular path through the sky. Because their counting methods were based on 60, they divided a circle into 360 parts called degrees. The symbol for degree (°) was taken from their symbol for the Sun.

Earth Movements Measure Time Earth spins and makes one complete turn in about 24 hours, as shown in **Figure 4**. This spinning causes the Sun to appear to move across the sky from east to west. It takes 24 hours from when the Sun is highest in the sky (noon) until it is highest in the sky again (noon the next day).

If Earth spins approximately 360° in 24 hours, then it spins through 15° in one hour. This led to the setting up of time zones on Earth that have the same time in minutes but vary in hours. A **time zone** is an area 15° wide in which the time is the same. **Figure 5** shows the time zones in the U.S. Ideally, time zones should be equal in size and follow lines drawn from the north pole to the south pole. However, for convenience, time zones are modified to fit around city, state, and country borders, and other key sites.

Figure 4 The sunlit side of Earth is day; the shadow side is night.

Reading Check How many degrees does Earth spin in one hour?

Reading Preview

Tie to Prior Knowledge

Seasons Ask students to think about the different seasons. Ask them to list at least one positive and one negative comment about each season. Then ask each student to select his or her favorite season and to write a brief paragraph explaining the choice.

Word Wall Post new vocabulary words in a prominent place in the classroom. Before reading, have students practice pronouncing the words. Ask them to predict meaning. After reading, ask students to use the terms in sentences, either orally or in written form.

Reading and Writing Skills Activities, pp. 45–46

The Date Line You can see that a problem would quickly arise if you just kept dropping back an hour earlier for each 15°. Eventually, you would come around Earth and it would be 24 hours earlier. It cannot be two different days at the same spot, so a day is added to the time at the International Date Line. If it is Monday to the east of the date line, then it is the same hour on Tuesday to the west of the date line. This line is drawn down through the Pacific Ocean (around islands, such as New Zealand) directly opposite the Prime Meridian, the starting point for this worldwide system of measuring time. The Prime Meridian is an imaginary line drawn on Earth that passes through Greenwich, England. Time based on this method is called Coordinated Universal Time (UTC). In some areas, this time is modified in summer so that there are more hours of daylight in the evening. This is referred to as Daylight Saving Time (DST). Some areas apply local modifications to this system as well.

Figure 5 The globe is divided into 24 time zones. Lines of longitude roughly determine the locations of time zone boundaries. Notice that each successive time zone to the west is one hour earlier.

Think Critically If you leave Russia at 12:30 A.M. on Tuesday and fly east for one hour across the Bering Strait, what time and day will you arrive in Alaska?

✓ Reading Check

Answer fifteen degrees

Discussion

Sunset Ask students to consider whether the Sun sets at the same time everywhere within a time zone. Would the Sun set at the same time in Wilmington, NC and Pittsburgh, PA? **Possible answer:** No, because it is farther east, the Sun sets earlier in Wilmington, NC. [L2]

Caption Answer

Figure 5 4:30 A.M., Monday (observe convergence of time zones near the Bering Strait on the map)

Teacher FYI

Earth's Rotation Using atomic clocks, scientists have found that each successive day on Earth is getting longer. Apparently, Earth's rotation has been slowing down for millions of years. Studies of ancient corals, which produce a growth line for each day-night cycle, show more growth lines per year than do present-day corals. By studying the growth lines on 500-million-year-old corals, scientists have determined that there were nearly 400 deposits per year. The year was the same length, but there were more days in a year when these corals were growing. Scientists hypothesize that Earth is being slowed by the gravitational attraction of the Moon. As this slowing continues, the length of a day will increase. The length of a year will not be affected. This means that the number of days in a year will continue to decrease, but the length of a year will not change.

Differentiated Instruction

English-Language Learners Use an Earth globe and a light source to show students how the length of the day varies at different places on Earth. Tilt the globe so the Northern Hemisphere is pointing toward the light source. Show how areas farther north receive more hours of daylight than areas farther south. Reverse the tilt and show students how the opposite is true.

Reading Strategy

Double-Entry Notes Ask students to divide a sheet of paper into two columns. In the left column, students should record specific notes from the text. The right column is reserved for student responses to the reading, such as comments, reflections, and opinions.

Fun Fact

Inform students that each year, they have ridden Earth one more time around the Sun.

Use an Analogy

Walking Around the Room Explain to students that the Sun appearing to move around Earth in reference to the stars is like one of them walking around the room. Students sitting in their seats see the person's position change with reference to objects on the wall. The person doing the walking sees his or her classmates seem to move with respect to the same objects. **L2** **ELL** **LS**
Visual-Spatial

Use Science Words

Word Meaning Students often have difficulty with describing the difference between rotation and revolution. Have one student stand in front of the class and start to slowly spin around. Ask students to say whether the moving student is rotating or revolving. **Possible answer: rotating** Then ask students to explain what the moving student should do to demonstrate revolution. **Possible answer: The moving student should walk around the outer edge of the room, thus revolving around the other students.** **L1** **ELL** **LS** **Visual-Spatial**

✓ Reading Check

Answer the plane of Earth's orbit around the Sun

Caption Answer

Figure 6 Earth's revolution around the Sun

Rotation Measures Days The spinning motion of Earth enables you to measure the passing hours of the day. **Rotation** is the spinning of Earth on its axis, an imaginary line drawn through Earth from its rotational north pole to its rotational south pole.

The apparent movement of the Sun from noon one day until noon the next day is called a solar day. This period is a bit longer than the time it takes Earth to rotate on its axis, however. This is because while Earth rotates, it also moves in orbit around the Sun and must rotate a bit more each day to make the Sun reach noon. However, if you measure time based on when a certain star rises above the horizon until it rises again, you will see a slightly shorter time period (23 h 56 m 4 s). This is called a sidereal day and is the true measure of the time it takes for Earth to rotate once on its axis.

Revolution Measures Years The motion of Earth around the Sun enables you to measure the passing of years. **Revolution** is the motion of Earth in its orbit around the Sun. **Figure 6** shows Earth's orbit around the Sun. As Earth revolves in its orbit, the Sun appears to move through the skies compared to the seemingly fixed positions of the stars.

The time it takes for the Sun to make one complete trip through the sky in reference to the background of stars is the same amount of time it takes for Earth to complete one trip around the Sun, or one sidereal year. The apparent path of the Sun during this year is called the ecliptic. Also, the **ecliptic** is defined as the plane of Earth's orbit around the Sun. The 12 constellations (star patterns) through which we observe the Sun moving during this year is called the zodiac, shown in **Figure 6**.

Figure 6 If the Sun were as faint as the stars at night, then you would see it travel along an annual path through the constellations of the Zodiac.

Think Critically What causes this apparent motion of the Sun?

✓ Reading Check What is the ecliptic?

192 CHAPTER 7 The Earth-Moon-Sun System

Science Journal

The Time of Year Have students write a brief paragraph in their Science Journals describing differences they have noticed about the area near their homes or school as an entire year passes. **L2** **LS** **Linguistic**

Why do seasons change?

Recall that Earth's orbit around the Sun is an ellipse. This means that Earth is closer to the Sun at one time than it is at other times. Is this the cause of seasonal changes on Earth? Because Earth is closest to the Sun in January, you would expect this to be the warmest month. However, you know this isn't true in the northern hemisphere; something else must be causing the change. These seasonal changes are caused by Earth's rotation, its revolution, and the tilt of its axis.

Seasons change on Earth because the number of hours of daylight each day varies and also because the angle at which sunlight strikes Earth's surface varies at different times of the year. Earth's axis is tilted 23.5° from a line drawn perpendicular to the plane of its orbit, or ecliptic. Because of this tilt, Earth's north geographic pole points toward Polaris throughout the year. Later, you will learn how this tilt, along with Earth's revolution, causes the seasons.

Changing Angle of Sunlight During the summer, the Sun is higher in the sky, and sunlight hits Earth's surface at a higher angle. As the year progresses, the Sun is lower and lower in the sky, and sunlight strikes Earth's surface at lower angles. When striking Earth's surface at higher angles, approaching 90° , sunlight is more intense and warms Earth's surface more than when it strikes the surface at lower angles. Because Earth remains tilted in the same direction as it revolves, different hemispheres are tilted toward the Sun at different times of the year. As shown in **Figure 7**, the hemisphere tilted toward the Sun receives sunlight at higher angles than the hemisphere tilted away from the Sun. The greater intensity of sunlight is one reason why summer is warmer than winter, but it is not the only reason. Another factor is involved.

Figure 7 The Sun's rays strike Earth's surface at higher angles in the northern hemisphere when the north pole is tilted toward the Sun.

SECTION 2 Time and Seasons 193

IDENTIFYING

Misconceptions

Seasons Many people, including many of your students, think that one cause of seasons is that the Sun's rays hit Earth directly at some times and indirectly at other times. All rays from the Sun are direct; the true explanation is that sometimes the rays hit at higher angles compared to other times.

Activity

Intensity of Sunlight Provide students with flashlights. Have them turn the flashlights on and hold them vertically above their desks so the light falls straight down on their desks. Then have them hold the flashlights at an angle with the surface of their desks. Discuss how the angle at which sunlight strikes Earth determines how intense or how spread out it is. **Possible answer:** The light from the flashlight, like that from the Sun, is spread out more when it strikes at an angle. **L2 ELL AS**

Visual-Spatial

LAB DEMONSTRATION

Purpose Students will see how area covered affects the intensity of sunlight.

Materials empty paper towel roll

Preparation Cut one end of the empty towel roll at a 45° angle.

Procedure Have students hold each end of

the towel roll against a sheet of paper and draw around it with a pencil.

Expected Outcome Students should have drawn a circle around the flat end and an ellipse around the slanted end of the empty paper towel roll.

Assessment

Which drawing, the circle or the ellipse covers a greater area? **Possible answer:** the ellipse How does this relate to the intensity of sunlight striking Earth? **Possible answer:** If the same rays from the Sun cover a larger area, the intensity of the light must be lower. **L2**

Teacher FYI

A 12-hour day There are 12 hours of daylight and 12 hours of night all over Earth on only two days—the first day of spring and the first day of autumn.

Quick Demo Hours of Daylight

Materials two thermometers, 75-watt goose-neck lamp

Estimated Time 15 minutes

Procedure Place a thermometer flat on a desk. Turn on the goose-neck lamp and direct its light on the thermometer for 4 min. Record the temperature. Shine the goose-neck lamp on the other thermometer for 8 min. and record this temperature. What is observed about the temperature readings on the two thermometers? *Possible answer: The temperature on the thermometer under the light for 8 min will be higher.* How does this relate to the number of hours of daylight? *Possible answer: More hours of daylight result in higher temperatures on Earth's surface.* L2 ELL

Visual-Spatial

Reading Check

Answer June

Post Reading

Science Journal Immediately following the reading, have students write what they learned from the following sections: Measuring Time on Earth and Why Do Seasons Change? Respond to students' comments without assigning a grade.

More Hours of Daylight in Summer During the summer, the Sun is above the horizon for more hours than it is when school begins in the fall. As the year progresses, the number of hours of daylight each day becomes fewer and fewer until it reaches a minimum around December 21 for the northern hemisphere. When do you think the number of hours of daylight would be at a maximum in the northern hemisphere? This happens six months later, around June 21. As shown in **Figure 8**, the hemisphere of Earth that is tilted toward the Sun receives more hours of daylight each day than the hemisphere tilted away from the Sun. This longer period of daylight is the second reason why summer is warmer than winter.

Reading Check

During which month does Earth's northern hemisphere experience more hours of daylight?

Figure 8 During the winter solstice for the northern hemisphere, the Sun's rays strike Earth perpendicular at the Tropic of Capricorn, while the area within the arctic circle remains in darkness. During the summer solstice, the Sun's rays are perpendicular to Earth at the Tropic of Cancer, while the area within the arctic circle remains in sunlight.

194 CHAPTER 7 The Earth-Moon-Sun System

Visual Learning

Figure 8 Help students understand the information shown in **Figure 8**. As you read the description, emphasize that the hemisphere of Earth tilted toward the Sun experiences more hours of daylight each day. Also help students understand that the farther north you are on Earth when the northern

hemisphere is tilted toward the Sun, the more hours of daylight you will experience. The farther south you are when the southern hemisphere is tilted toward the Sun, the more hours of daylight you will experience. L2 ELL

Equinoxes and Solstices Because of the tilt of Earth's axis, the Sun's position relative to Earth's equator constantly changes. Most of the time, the Sun is north or south of the equator, but two times during the year, the Sun is directly over the equator.

Figure 8 shows that the Sun reaches an **equinox** when it is directly above Earth's equator, and the number of daylight hours equals the number of nighttime hours all over the world. The term *equinox* is derived from two words meaning "equal" and "night." At that time, neither the northern nor the southern hemisphere is tilted toward the Sun. In the northern hemisphere, the Sun reaches the spring equinox on March 20 or 21, and the fall equinox on September 22 or 23. In the southern hemisphere, the equinoxes are reversed.

The **solstice** is the point at which the Sun reaches its greatest distance north or south of the equator the Tropic of Cancer and Tropic of Capricorn, respectively. The term *solstice* is derived from the Sun's name, *Sol*, and a Latin word meaning "standing"; that is, it appears to stand, or stop moving, north or south in the sky. In the northern hemisphere, the Sun reaches the summer solstice on June 21 or 22, and it reaches the winter solstice on December 21 or 22. Just the opposite is true for the southern hemisphere. When the Sun is at the summer solstice, there are more hours of daylight than during any other day of the year, and the Sun's rays strike at a higher angle. When it's at the winter solstice, on the shortest day of the year, the most nighttime hours occur and the Sun's rays strike at the lowest angle.

Mini LAB

Modeling the Sun's Rays at Solstice

Procedure

1. Use a **globe** with the equator, the Tropic of Cancer, and the Tropic of Capricorn indicated.
2. Set up a light source, such as a **flashlight or goose-neck lamp**, so light shines vertically at Earth's equator.
3. Tilt the globe 23.5° from vertical so that first the northern and then the southern hemisphere is tilted toward the light.

Analysis

1. When the globe was tilted 23.5° toward and away from the light, what latitudes received vertical rays?
2. What areas of Earth never received vertical rays?

Mini LAB

Purpose Students model the Sun's rays **Kinesthetic**

Materials Earth globe, flashlight or goose-neck lamp

Teaching Strategy Anchor the light source so students only need to move the globe.

Safety Precautions Caution students that the lamp is hot.

Troubleshooting Mark the location of the Tropics of Cancer and Capricorn on the globe.

Analysis

1. 23.5° N and 23.5° S
2. north of 23.5° N and south of 23.5° S

Assessment

Oral Which season begins in the Northern Hemisphere when the Sun's rays strike the Tropic of Capricorn vertically? **winter** [L2]

section 2 review

Summary

Measuring Time on Earth

- Humans use movements of Earth, the Moon, and the Sun to measure time.
- Earth's rotation is used to measure days.
- Earth's revolution is used to measure years.
- The ecliptic is the Sun's apparent yearly path through the zodiac.

Why do seasons change?

- Earth's seasonal changes are caused by its tilt, rotation, and revolution.
- Equinoxes occur when the Sun is directly over Earth's equator. Solstices occur when the Sun reaches its greatest distance north or south of the equator.

Self-Check

1. **Determine** how long it takes Earth to make one complete turn on its axis.
2. **Explain** why each time zone contains 15° of longitude. If it is 4:15 P.M. in one time zone, what is the time two time zones to the west?
3. **Explain** how a solar day differs from a sidereal day.
4. **Compare and contrast** rotation and revolution.
5. **Think Critically** Why does Earth's surface become warmer in summer than it does in winter?

Applying Math

6. **Use Decimals** It takes Earth about 365.25 days to make one trip around the Sun. As it does this, Earth travels 360° in its orbit. On average, how many degrees does Earth travel each day?

3 Assess

DAILY INTERVENTION

Check for Understanding

Linguistic Have students write a short narrative explaining two causes of Earth's seasonal changes. **P**

Reteach

Equinox or Solstice Ask students whether an equinox or a solstice occurs when the Sun is at its farthest point south of the equator.

section 2 review

1. 24 hours; one day
2. If Earth rotates once in 24 hours, then it rotates 360° in 24 hours or 15° per hour; 2:15 P.M.
3. A solar day is measured from noon on one day until noon the next day. A sidereal day is Earth's period of rotation based on the position of a star.

As Earth revolves around the Sun, the Sun appears to move slightly each day, making the solar day slightly longer than the sidereal day.

4. Both are movements of Earth. Rotation is the spinning of Earth on its axis; revolution is Earth's movement around the Sun.

5. The Sun's rays strike Earth's surface at a higher angle for more time each day during the summer.
6. 0.99° or about 1°

Assessment

Oral How much is light intensity decreased, if the same amount of light is spread over an area three times larger? **by one-third** [L2]

Real-World Problem

Purpose Students will model the intensity of light as it strikes Earth's surface at different angles. **Kinesthetic**

Process Skills model, compare and contrast, measure, observe, recognize cause and effect, make and use tables

Time Required 40 minutes

Alternate Materials unshaded 75-W lamp, books, small envelopes

Safety Precautions Caution students that the lamp will be hot. Ask students to carefully handle thermometers.

Procedure

Teaching Strategies

- Practice setting the goose-neck lamp at different angles or using books to change angles.

Troubleshooting

- Check bulbs in lamps, and have extras available.

Conclude and Apply

1. Temperature readings both increase. However, T-1 increases faster and reaches higher temperature.
2. 75° = summer; 20° = winter
3. The angle at which sunlight strikes Earth's surface changes, the intensity of light changes and the surface is heated to a different amount.

Assessment

Process Infer how placing the goose-neck lamp at 90° would affect temperature. It should rise more quickly and reach a higher final reading. Use PASC, p. 89. **L2**

Comparing the Angle of Sunlight to Intensity

Earth is warmed differently depending on the angle at which sunlight strikes it.

Real-World Problem

How can you a model the angle at which sunlight strikes Earth's surface?

Goals

- **Model** different angles at which sunlight strikes Earth's surface.
- **Compare and contrast** the amount of heat generated by light striking at different angles.

Materials

75-W bulb in a gooseneck lamp
alcohol thermometers (2)
sheets of construction paper, one color (2)
protractor
* unshaded 75-W lamp
* books to change the angle of the thermometers

*Alternate materials

Safety Precautions

WARNING: Do not touch lamp or lightbulb without safety gloves. They stay hot after being turned off. Handle thermometers carefully.

Procedure

1. Copy the data table shown on this page.
2. Label the thermometers T-1 and T-2 and record their temperatures in the data table.
3. Fold the construction paper to form a pocket that will conceal the thermometer's bulb.

4. Place T-1 in the pocket and lay them on a desktop. Turn on the lamp. Position the lamp so that light strikes the pocket at an angle of 75°.
5. Record the temperature of T-1 at 10 min and at 20 min.
6. Repeat steps 3, 4, and 5 using T-2, but aim the lamp at an angle of 20°.

Conclude and Apply

1. **Compare and contrast** the temperature readings of each thermometer.
2. **Infer** which angle models the Sun's position during the summer and during the winter.
3. **Explain** how changes in the angle at which sunlight strikes Earth's surface are one cause of Earth's changing seasons.

Data Table

Thermometer	Original Temperature	Temperature at 10 min	Temperature at 20 min
T-1			
T-2			

Communicating Your Data

Compile your classmates' data. Find the average temperatures—original, at 10 min, and at 20 min—for T-1 and T-2. Compare and contrast your results with the class averages.

Communicating Your Data

Students should prepare a drawing of sunlight falling on a round Earth. It should show how light hitting Earth at different latitudes strikes the surface at different angles. Temperatures should be higher where angles of sunlight are higher.

Differentiated Instruction

Visually Impaired Have visually impaired students watch while you show them how much light is concentrated when an overhead projector is held directly in front of the wall and then how it spreads over a larger area when held at an angle to the wall. **L2**

Earth's Moon

Reading Guide

What You'll Learn

- **Describe** how tides on Earth are caused by the Moon.
- **Explain** how the Moon's phases depend on the relative positions of the Sun, the Moon, and Earth.
- **Compare and contrast** solar and lunar eclipses.
- **Analyze** what surface features of the Moon reveal about its history.

Why It's Important

The Moon is our nearest neighbor in space and affects Earth in many ways.

Review Vocabulary

lava: molten rock

New Vocabulary

- tide
- moon phase
- solar eclipse
- lunar eclipse
- maria
- regolith

Movement of the Moon

You have seen the Moon move across the sky from east to west, just like the Sun. This is an apparent movement like the Sun's, caused by Earth's rotation. But, the Moon actually does move in another way. If you look at the Moon each day at the same time over a period of a few days, you will see that it moves toward the east.

Rotation and Revolution This eastward movement of the Moon is an actual movement that is caused by the Moon's revolution in its orbit. It takes 27.3 days (a sidereal month) for the Moon to revolve once around Earth and line up with the same star again. Because Earth also revolves around the Sun, it takes more than two more days for the Moon to line up with Earth and the Sun again. This means that a complete lunar phase cycle takes 29.5 days, known as a synodic month.

Many people think the Moon does not rotate because it always keeps the same side facing Earth. This is not true. As shown in **Figure 9**, the Moon keeps the same side facing Earth because it takes 27.3 days to rotate once on its axis—the same amount of time that it takes to revolve once around Earth. You can observe this by having a friend move the ball around you while keeping the same side of it facing you. You will see only one side.

Figure 9 The face of the "man in the moon" is always facing Earth.

Explain why the same side of the Moon always faces Earth.

Caption Answer

Figure 9 The Moon's period of revolution and period of rotation are the same.

IDENTIFYING

Misconceptions

The Moon's Rotation Some students may think that the Moon does not rotate because it keeps the same side facing Earth. Explain that since the Moon revolves around Earth we would see all sides if it did not rotate. Ask students to hold their right hand at the side of their faces edge-on, so that they see the palms. Tell them to move their hands to the left side of their faces without rotating it. They should now see the backs of their hands.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.3.4.1

Teaching Strategy

- Explain that because the Moon revolves around Earth in a counter-clockwise direction as Earth revolves around the Sun, it rises 52.7 minutes later each day.
- The Moon travels around Earth (360°) in 27.3 days or 13.2° per day. Earth spins through 360° in one day and 13.2° is equal to 52.7 minutes.

Answers

1. 2:38 PM

How does the Moon affect Earth?

The Moon affects Earth in many ways, some obvious and others less so. If you have ever been to a beach for vacation, you realized that the water is not always at the same location on the beach. Sometimes the water comes farther up the beach than at other times. Have you ever placed your towel on the beach and come back later to find it wet because the tide came in? You also may have noticed that the Moon doesn't look the same each evening. Sometimes you can see all of the side facing Earth, while at other times, you can barely see any of it. Let's take a look at these and some other effects of the Moon on Earth.

Applying Math

Solve a Simple Equation

TIDES The Moon rises an average of 52.7 min later each day. If the time of high tide is known for one day, this formula can be used to determine when high tide will occur on the next day or any successive day.

$$T_N = T_0 + N \times 52.7 \text{ min}$$

In this formula, T_0 is the original time of high tide on a given day and T_N is the time of high tide on any successive day. N is the number of days later for which you wish to determine the time of high tide. If the tide is high at 1:00 P.M., find out what time it will be high in 7 days.

IDENTIFY known values and unknown values

Identify the known values:

T_0 = original time of high tide = 1:00 P.M.

N = the number of days later for which you wish to determine high tide = 7

52.7 min = how much later the Moon rises each day

Identify the unknown value:

T_N = the time of high tide on N number of days

SOLVE the problem

Substitute the known values into the equation for time.

$$T_N = 1:00 \text{ P.M.} + 7 \times 52.7 \text{ min} = 1:00 \text{ P.M.} + 369 \text{ min}$$

$$T_N = 1:00 \text{ P.M.} + 6 \text{ h } 09 \text{ min} = 7:09 \text{ P.M.}$$

Practice Problem

Low tide is the best time to hunt for seashells. If you see that the tide is low at noon on Thursday, when during the day will it be low on the following Sunday?

For more practice problems, go to page 879 and visit Math Practice at fl.gpscience.com.

Reading Strategy

Infer Inferring involves using prior knowledge to make a logical prediction based on evidence. Use a statement, such as the following, to model: The Earth's surface passes through a high tide and a low tide. Students might infer that the closest coastal area to their home would experience a high tide and a low tide daily.

Tides Think again of the beach and how the level of the sea rose and fell during the day. This rise and fall in sea level is called a **tide**. A tide on Earth is caused by a giant wave produced by the gravitational pulls of the Sun and the Moon. This wave has a wave height of only 1 or 2 m, but it has a wavelength of thousands of kilometers. As the crest of this large wave approaches the shore, the level of the water in the ocean rises. This rise of sea level is called high tide. About six hours later, as the trough of the wave approaches, sea level drops, causing a low tide.

Earth and the Moon both revolve around their common center of mass located about 1,700 km below Earth's surface. Because Earth is much more massive, the Moon does most of the moving, and it seems to us as though the Moon were revolving around Earth. This center of mass, in turn, revolves around the Sun. This is why Earth, Moon, Sun are considered as a three-body system.

As Earth rotates and the Moon revolves, different locations on Earth's surface pass through the high and low tides. Although the Sun is much more massive than the Moon, it also is much farther away. Because of this, the Moon has a greater effect on Earth's tides than does the Sun. However, the Sun does affect Earth's tides: it can strengthen or weaken the tidal effect. When the Moon and the Sun pull together, when they are lined up, high tides are much higher and low tides are much lower. This is called a spring tide, as shown in **Figure 10**. However, when the two are at right angles to each other, the high tide is not as high and the low tide not as low, producing a neap tide.

Reading Check What happens to the sea level at spring tide?

Moonlight

The Moon shines because it reflects sunlight from its surface. Just as half of Earth experiences day as the other half experiences night, half of the Moon is lighted while the other half is dark. As the Moon revolves around Earth, different portions of the side facing Earth are lighted, causing the Moon's appearance to change. **Moon phases** are the changing appearances of the Moon as seen from Earth. The phase you see depends on the relative positions of the Moon, Earth, and the Sun.

Phases of the Moon A new moon occurs when the Moon is between Earth and the Sun. During a new moon, the side of the Moon facing away from Earth is lighted and the side of the Moon facing Earth receives no light from the Sun. The Moon is in the sky, but it cannot be seen, except for a special alignment you will learn about later.

Figure 10 Earth's tides are an example of how the Sun, Moon, and Earth pull on each other and operate as a three-body system.

A The Sun, Earth, and Moon are in alignment during spring tide.

B The Sun, Earth, and Moon form a right angle during neap tide.

Identify whether high tide is higher during spring tide or neap tide.

SECTION 3 Earth's Moon 199

Teacher FYI

Proxigean Spring Tide Just as Earth's orbit around the Sun is elliptical, the Moon's orbit around Earth is also elliptical. This means that the Moon is closer to Earth at some times compared to others. The closest point in its orbit is called perigee. In the case of the

Moon, orbits vary, and some perigees are closer than others. The closest perigee is called proxigee. When this occurs at a new moon or a full moon, the high spring tides are unusually high and the low spring tides are unusually low.

Teacher FYI

Tides Just as the Moon produces tides on Earth and its oceans, Earth has a similar effect on the Moon. Earth's pull on the Moon is why the Moon keeps one side facing Earth. It has become tidally locked into a synchronous orbit in which its rotation matches its revolution.

Reading Check

Answer High tides are higher and low tides are lower.

Caption Answer

Figure 10 neap tide

Discussion

Phases of the Moon Remind students that when standing on Earth, they can see phases of the Moon. If they were on the Moon, would they see Earth go through phases? Possible answer: Yes, Earth would go through all of the phases, except that Earth would stay in one position in the lunar sky. This occurs because the Moon keeps one side always facing Earth. **L2**

Use Science Words

Word Usage The words *waxing* and *waning* are used to describe Moon phases. Have students research the meanings of these words and use them in sentences. Possible answer: Waxing phases occur as the Moon appears to grow larger. Waning phases occur as the Moon appears to get smaller. **L2** **IS** **Linguistic**

Activity

Moon Phases Have students face south and observe a first quarter moon in the southwestern sky shortly after sunset. Have them sketch what they see. Student sketches should show that the right side of the moon was lighted. Ask students if people living south of the equator would see the same thing. Possible answer: No, they would see the Moon in their northwestern sky and would see it in reverse, with the left side of the Moon lighted. **L2** **ELL** **IS** **Visual-Spatial**

Mini LAB

Purpose Students will model the interactions among Earth, the Moon, and the Sun that cause phases and eclipses to occur.

Materials unshaded lamp, pencil, small white-plastic foam ball

Teaching Strategy Prior to doing the lab, ask students to brainstorm about what they think causes eclipses and lunar phases.

Safety Precaution Warn students that the lightbulb will be hot.

Analysis

1. More or less of the side of the ball facing the student was lighted. New moon—the ball was between the student and the light. The other phases followed in order.
2. During new moon, the ball blocked the light. During full moon, the ball was in the shadow of the student.

Assessment

Performance Ask students to use their models to demonstrate various phases of the Moon or an eclipse to members of their families or a fellow student.

Mini LAB

Modeling Phases and Eclipses

Procedure

1. Turn on a lamp with no shade and place a small, white, plastic-foam ball on the end of a pencil.
2. Stand facing the lamp and hold the white plastic-foam ball between your head and the lamp.
3. Slowly move the ball counterclockwise around your head and observe how much of the side of the ball facing you is lighted at different positions.
4. Note positions where the ball blocks light from the lamp—or moves into the shadow cast by your head.

Analysis

1. Describe what happened to the ball as it was moved around your head, and identify the moon phases at various positions.
2. At which positions (phases) was the ball blocking the light or falling into shadow? At which phase(s) can eclipses occur?

Figure 11 When viewed from Earth's north pole, the Moon has a counterclockwise orbit.

Infer In this figure, the Sun's rays are coming from the right. Why are the Moon's waning phases showing sunlight on the left?

200 CHAPTER 7 The Earth-Moon-Sun System

Waxing Phases After a new moon, the moon's phases are said to be waxing—the lighted portion that we see appears larger each night. The first phase we see after a new moon is called the waxing crescent. About a week after a new moon, we see one-half of the Moon's lighted side, or one-quarter of the Moon's surface. This phase is the first-quarter.

The moon is in the waxing gibbous phase from the first quarter up until full moon. A full moon occurs when we see all of the Moon's lighted side. At this time, the Moon is on the side of Earth opposite from the Sun.

Waning Phases After a full moon, the lighted portion that we see begins to appear smaller. The phases are said to be waning. When only half of the side of the Moon facing Earth is lighted, the third-quarter phase occurs. The waning crescent occurs before another new moon. Only a small slice of the side of the Moon facing Earth is lighted.

The word *month* is derived from the same root word as *Moon*. The complete cycle of the Moon's phases, shown in **Figure 11**, takes about 29.5 days, or one synodic month. Recall that it takes about 27.3 days for the Moon to revolve around Earth. The discrepancy between these two numbers is due to Earth's revolution around the Sun. It takes the Moon a little over two days to “catch up” with Earth's advancement around the Sun.

Differentiated Instruction

Learning Disabled Help your learning-disabled students to understand how a smaller Moon can block out a larger Sun. Have them hold one hand in front of their faces and then move it until their hand (much smaller) can block out your desk (much larger). Tell students to compare the distances between their faces and their hands and their faces and the desk. **L1 ELL**

Visual Learning

Figure 11 Help students understand the information presented in **Figure 11**. The Moon's cycle of phases begins with new moon. From new moon to full moon the phases are waxing or growing in size. After full moon, the phases are waning or getting smaller. A full moon is on the opposite side of Earth from the Sun, so it rises as the Sun sets and sets as the Sun rises. A new moon rises and sets with the Sun. **L2 ELL**

Content Background

In 1504, Columbus and his crew were stranded in what is now Jamaica while they repaired their ship. They faced starvation when the native people refused to sell them food. But Columbus knew exactly when a lunar eclipse would occur and told them that he would darken the Moon if they did not supply food. At first they laughed, but were terrified as the Moon started to disappear. Although they probably had seen eclipses before, they could not imagine a man causing one to happen. Columbus got his food.

Eclipses

If you knew nothing about what the Sun is or why it produces so much light and heat, wouldn't you be concerned if suddenly it darkened? Think of how humans from long ago must have reacted when the Moon passed in front of the Sun and the source of light and heat was blocked, as it is during an eclipse.

In the year 585 B.C., a battle was raging between the armies of the Lydians and the Persians when suddenly, the Sun was eclipsed by the Moon. The two armies were so stunned by the event that they put down their weapons and stopped fighting.

Now we understand what causes eclipses of both the Sun and the Moon. We know that for the Moon to block out the Sun, it must appear to be the same size. In fact, both the Sun and the Moon have apparent diameters that are almost the same, about 0.5° . If it weren't for this, a total eclipse of the Sun might never happen. Because the Sun is about 400 times larger than the Moon, it also must be about 400 times farther from Earth for a total solar eclipse to occur.

Eclipses occur when Earth or the Moon temporarily blocks sunlight from reaching the other object. Sometimes, during a new moon, a shadow cast by the Moon falls on Earth, causing a solar eclipse. During a full moon, a shadow of Earth can be cast on the Moon, resulting in a lunar eclipse. Eclipses can occur only when the Sun, the Moon, and Earth are lined up perfectly. Because the Moon's orbit is tilted about 5° from the plane of Earth's orbit around the Sun, eclipses happen only a few times each year.

Solar Eclipses A **solar eclipse** occurs when the Moon moves directly between the Sun and Earth and casts a shadow on part of Earth. The darkest portion of the Moon's shadow is called the umbra. A person standing within the umbra experiences a total solar eclipse. As shown in **Figure 12**, the only portion of the Sun that is visible during a total eclipse is part of its atmosphere, which appears as a pearly white glow around the edge of the eclipsing Moon. This is the only time the entire disk of the new moon phase can be photographed—it appears black against the Sun.

As shown in **Figure 13**, surrounding the umbra is a lighter shadow on Earth's surface called the penumbra. Persons standing in the penumbra experience a partial solar eclipse. **WARNING:** Regardless of where you are standing, never look directly at a solar eclipse. The light can permanently damage your eyes.

How are Earth, the Moon, and the Sun aligned during a solar eclipse?

Figure 12 The solar corona can be seen as a pale glow around the lunar disk. Sunlight shining through lunar valleys produces a diamond-ring effect.

Early Civilizations

Celestial objects were studied by early civilizations. Some hypotheses proposed by the Babylonians and the early Greeks were close to reality, but other ideas were wrong. Research how some early civilizations explained eclipses and other astronomical observations and report your findings to your class using drawings and diagrams.

Figure 13 A total solar eclipse appears only within the Moon's umbra.

SECTION 3 Earth's Moon 201

Caption Answer

Figure 11 The photos show the Moon as seen from Earth position.

Early Civilizations It is said that Thales predicted a solar eclipse in 585 B.C. By 430 B.C., Athenian Meton described the 19-year cycle of eclipses. Aristotle claimed that Earth was the center of the universe. He thought that if it wasn't, we should see parallax among the stars. Since no parallax could be observed, either Earth was in the center or the stars were very far away. He believed stars were fairly close, thus he concluded that Earth was in the middle of the universe.

Make a Model

A Sun-Moon Model Have students cut out a circle 200 cm (2 m) in diameter from yellow paper that has been pieced together. Have them cut another circle from a piece of gray paper that is 0.5 cm in diameter. Tell students that they have cut out circles that represent the comparative diameters of the Sun and Moon. Have one student hold the small paper circle up to his or her eye. Have other students carry the large circle away from the first student until he or she says that the small circle can block out the large one. Students now have a model of the Moon eclipsing the Sun. Ask students to explain how the Moon can block out the Sun. Possible answer: the Sun is about 400 times farther from Earth than is the Moon. **L1 ELL**

Answer The Moon is directly between Earth and the Sun.

Science Journal

Solar Eclipse Have students write a brief description of factors that must be true in order for a solar eclipse to occur. Possible answer: The Moon must line up directly between Earth and the Sun. This can occur dur-

ing new moon. Then ask them why a solar eclipse doesn't occur every new moon. Possible answer: The Moon's orbit is tilted such that it can sometimes be above or below the Sun during a new moon. **L2 Linguistic**

Reading Check

Answer The Moon is on the opposite side of Earth from the Sun.

Inquiry Lab

Lunar Eclipses

Question Why don't lunar eclipses occur every time the Moon is full?

Possible Materials flashlight, small light source, plastic foam balls, large pieces of cardboard or hard plastic, cardboard circles or plastic hoops

Estimated Time 30 minutes

Teaching Strategies

- Encourage students to develop models that demonstrate a full moon can occur without a lunar eclipse.
- Remind students that the Moon's orbit varies about 5° above and below the ecliptic and that for a total lunar eclipse to occur, the Sun, Earth, and the Moon must be perfectly aligned—that is, they must be on the same plane.
- Guide students to see how two planes can intersect, but do not have to be in the same plane.
- If students ask, tell them that the diameter of Earth is about four times that of the Moon and that the distance from Earth to the Moon is about 30 Earth diameters.
- Suggest that students use their model to demonstrate partial lunar eclipses.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Caption Answer

Figure 15 small shadow

Figure 14 Sometimes during a partial lunar eclipse, Earth's curvature can be seen silhouetted on the Moon. The red coloration is caused by the refraction of sunlight passing through Earth's atmosphere before reaching the Moon's surface.

Lunar Eclipses When Earth's shadow falls on the Moon, a **lunar eclipse** occurs. A lunar eclipse begins when the Moon moves into Earth's penumbra. As the Moon continues to move, it enters Earth's umbra, and you see a curved shadow on the Moon's surface, as shown in **Figure 14**. It was this shadow that led Aristotle to conclude that Earth is spherical. When the Moon moves completely into Earth's umbra, a total lunar eclipse occurs, as shown in **Figure 15**. The Moon sometimes becomes red during an eclipse because light from the Sun is scattered and refracted by Earth's atmosphere. Longer wavelength red light is affected less than shorter wavelengths, so more red light falls on the Moon.

A partial lunar eclipse occurs when only a portion of the Moon moves into Earth's umbra. The remainder of the Moon is in Earth's penumbra and, therefore, receives some direct sunlight. A partial lunar eclipse also occurs when the Moon is partially or totally within Earth's penumbra. However, this can be difficult to see because some direct sunlight falls on the Moon, making it appear only slightly dimmer than usual.

A total solar eclipse can occur as often as twice a year, yet most people live their entire lives without witnessing one. You may never see a total solar eclipse, but it is almost certain you will have a chance to see a total lunar eclipse. The reason why it is so rare to view a total solar eclipse is that only those people in the small region where the Moon's umbra strikes Earth can see one and, even then, there must be clear skies. In contrast, the opportunities to witness lunar eclipses are much more frequent, and anyone on the night side of Earth can see them.

Reading Check

How are Earth, the Moon, and the Sun aligned during a lunar eclipse?

Figure 15 A total lunar eclipse occurs when the Moon is entirely within Earth's umbra. *Umbra* is the Latin word for "shadow." Just as a peninsula is almost an island, a penumbra is almost a shadow. **Research** What does umbrella mean?

Science Journal

Lunar Eclipse Have students write a brief description of factors that must be true in order for a lunar eclipse to occur. **Possible answer:** The Moon must line up directly on the opposite side of Earth from the Sun. This can occur during full moon. Then ask them why a lunar

eclipse can be seen by more people than a solar eclipse. **Possible answer:** Since the Moon is passing into Earth's shadow, all people on the night side of Earth can see a lunar eclipse. **L2 Linguistic**

The Moon's Surface

When you look at the Moon, as shown in **Figure 16**, you can see many of its larger surface features. Craters, rays, mountains, and maria can easily be seen through a small telescope or a pair of binoculars. What are these different features, how did they form, and what do they tell us about the Moon's history and interior?

Craters, Maria, and Mountains Many depressions on the Moon were formed by meteorites, asteroids, and comets, which strike the surfaces of planets and their satellites. These depressions, which are called craters, formed early in the Moon's history. Surrounding many craters are ray patterns produced by lighter-colored material from just below the lunar surface that was blasted out on impact and settled on top of the darker surface material around the craters. During the impact, when these large basins formed, cracks may have formed in the Moon's crust, allowing lava from the still-molten interior to reach the surface and fill in the basins, forming maria.

Maria are the dark-colored, relatively flat regions on the Moon's surface, shown in **Figure 16**. The igneous rocks of the maria are 3 to 4 billion years old. They are the youngest rocks found on the Moon so far. This indicates that the craters formed after the Moon's surface originally cooled. However, the maria formed early enough in the Moon's history that molten rock material still remained in the Moon's interior.

Surrounding the large depressions that later filled with lava are areas that were thrown upward in the original collision and formed mountains. The largest mountain ranges on the Moon surround the large, flat, dark-colored maria.

Regolith When NASA scientists started to plan for crewed spacecraft to land on the Moon, they were concerned about whether the lunar surface would be able to support the craft? To find out, unmanned *Surveyor* spacecraft were landed on its surface. One *Surveyor* craft actually bounced a few times as it landed on the side of a crater. What was this material that the spacecraft had landed on?

Impacts on the Moon throughout its history led to the accumulation of debris known as **regolith**. On some areas of the Moon, this regolith is almost 40 m thick, while in other locations, it is only a few centimeters thick. Some regolith is coarse, but some is a fine dust. If you watch astronauts walking on the Moon, you will notice that they often kick up a lot of dust.

Figure 16 Notice the light-colored material radiating outward from the large crater near the base of the Moon.

Identify What are the flat, dark-colored regions called? What are the light-colored areas radiating from the craters called?

Caption Answer

Figure 16 maria; rays

Fun Fact

The Moon is covered in dust, called regolith, to an average depth of about 20 m. The regolith has the consistency of fine powder, similar to ready-mix dry mortar. It has formed from billions of years of meteorite impacts.

Quick Demo

Moon Surface Features

Materials moon map or globe

Estimated Time 10 minutes

Procedure Show students a map of the Moon (near side and far side) or a globe. Show how the far side has many more craters than the near side. Ask students why this might be true. **Possible answer:** Earth protects the near side of the Moon. Many meteorites that would have hit the Moon's near side were pulled toward Earth. Point out key features on the near side of the Moon (craters, maria, mountains). Ask students how maria may have formed. **Possible answer:** When meteorites impacted on the Moon's surface, they formed depressions and cracks in the crust. Magma flowed through the cracks onto the Moon's surface, filling the depressions. **L2 ELL**

Visual-Spatial

Visual Learning

Figure 16 Help students understand the information presented in **Figure 16**. Show students that rays of lighter material radiate outward from craters. Explain that when the meteorites struck

the Moon, light material of the crust was ejected out over the darker surrounding rock. **L2 ELL**

Caption Answer

Figure 17 Earth's gravitational attraction is stronger on Earth and the Moon's greater-density core than between Earth and the Moon's less-dense crust.

Content Background

The Moon's Interior Discuss with students that seismographs were left behind on the Moon. They detected moonquakes and this data has enabled NASA scientists to model the Moon's interior.

Data shows that the Moon's interior is differentiated. Although it is thought that the Moon has an iron core, it is not as large as Earth's. This may be a result of the giant impact that formed the Moon. Most of the iron cores of the two colliding bodies fell back to the reforming Earth.

As the Moon began to cool, Earth's gravity affected different parts of the Moon's structure differently. The thinner crust on the side of the Moon facing Earth was caused by the tidal influence of gravity pulling more on the mantle material than on the crustal material.

✓ Reading Check

Answer on the side facing away from Earth

Figure 17 The Moon's crust is thinnest on the side nearest to Earth.

Infer Why is the Moon's crust thinnest on the side facing Earth?

seismographs left on the Moon by *Apollo* astronauts. Just as the study of earthquakes allows scientists to map Earth's interior, the study of moonquakes helps them study the Moon's interior and has led to the model shown in **Figure 17**. This model shows that the Moon's crust is about 60 km thick on the side facing Earth and about 150 km thick on the side facing away. Below the crust, a solid mantle may extend to a depth of 1,000 km. A partly molten zone of the mantle extends farther down. Below this is an iron-rich, solid core.

✓ Reading Check Where is the Moon's crust thickest?

Exploring the Moon

More than 20 years after the *Apollo* program ended, the *Clementine* spacecraft was placed in lunar orbit. *Clementine* compiled a detailed map of the Moon's surface, including the South Pole-Aitken Basin. This is the oldest identifiable impact feature on the Moon's surface. It is also the largest and deepest impact basin or depression found so far anywhere in the solar system, measuring 12 km in depth and 2,500 km in diameter. Because the angle of sunlight is always low near the poles, much of this depression remains in shadow throughout the Moon's rotation. This location provides a cold area where ice deposits from impacting comets may have collected. The *Clementine* spacecraft, and later the *Lunar Prospector*, both collected evidence that supports the hypothesis that water-ice has accumulated in South Pole-Aitken Basin. See **Figure 18** to learn more about this.

Scienceonline

Topic: *Clementine* and *Lunar Prospector* Missions

Visit fl.gpscience.com for Web links to information about the missions of the *Clementine* and *Lunar Prospector* spacecraft.

Activity Make a table that lists the major goals of each mission, and whether or not it succeeded.

Teacher FYI

Water on the Moon The water that may exist at the Moon's poles was not found directly. Its presence is hypothesized from the detection of neutrons by the *Lunar Prospector* spacecraft. Scientists believe that cosmic rays continually bombard the Moon's surface interact with the hydrogen in the water and release neutrons that were detected by the spacecraft. The

water could be used by humans in the everyday operation of a nearby moon base or could be separated into oxygen and hydrogen to be used for rocket fuel. The anticipated cost of transporting water to the Moon is thousands of dollars per kg. This led one scientist to state that the water-ice deposits could become the most valuable real estate in the solar system.

Figure 18

Astronomers long believed that the Moon was a cold, dry place without atmosphere. But a few scientists hypothesized that water could exist on the Moon under certain conditions. This hypothesis was proven correct in the late 1990s by data from the spacecrafts *Clementine* and *Lunar Prospector*.

HOW DID IT GET THERE? Throughout its history, the Moon has been bombarded by comets and meteorites, most of which contain water-ice. Upon impact, some of the water would have quickly vaporized and be lost to space. However, some was deposited in the bottom of deep polar craters. Temperatures in these craters never exceed about -173°C . At these temperatures, ice could persist for billions of years.

HOW MUCH IS THERE? Estimates of how much water-ice exists vary, but some estimates are as high as 6 trillion kg. Ice might be buried several meters below the surface, either in solid blocks or as ice crystals mixed with lunar regolith. Water is important for many reasons. It would be needed for the survival of humans at any future lunar bases. Also, it could be split using solar power into hydrogen and oxygen to make rocket fuel.

SECTION 3 Earth's Moon 205

Visualizing Water on the Moon

Have students examine the pictures and read the captions. Then ask the following questions.

What made some scientists think that water might exist on the Moon? The fact that the Moon has many craters caused by impacts with comets and meteorites that are known to contain water-ice.

How and where has water been detected on the Moon? It was detected by orbiting spacecraft using an instrument called a neutron spectrometer near the Moon's poles.

Why might a source of water on the Moon be important for future space exploration? Any future Moon base or colony could use the water for life support or as a source of rocket fuel.

Activity

Devise a model or use a common object to show how the bottoms of craters at the Moon's poles are not struck by sunlight. Possible solutions: Use a more or less spherical object with an indentation on one or both ends. Then shine light so that it strikes the object at right angles. Objects could include an apple, a clay sphere with large craters at the top and bottom, or plastic-foam balls having craters carved in them.

Differentiated Instruction

Challenge Ask students to research the topic and find out more why the water is found primarily in craters at the poles and more specifically in craters in the Aitken Basin. Prepare a diagram showing how parts of this area are particularly suited to preserving water-ice and present it to your class.

L3

Activity

Crater Formation Provide students with a flat pan in which you have placed a 2.5-cm layer of flour covered by a 0.5-cm layer of dark gray ready-mix mortar. Have them drop various-sized objects into the pan from different heights. Have students write a brief description of their observations in their Science Journals.

Possible answer: As an object impacted on the gray powder, a crater formed and lighter material from just under the surface was ejected and fell back onto the surrounding gray material. Deeper and larger craters were formed by larger objects. **L2 ELL IS Visual-Spatial**

Reading Check

Answer Mascons are concentrations of mass under the Moon's surface. They could be what are left of the meteorites that formed the impact basins.

A large, Mars-sized body collided with primitive Earth approximately 4.6 billion years ago.

The violent collision melted and vaporized some of Earth's crust and mantle and hurled it into space.

Figure 19 According to the giant impact theory, the Moon formed after Earth was struck a glancing blow by a body that was more massive than Mars. For millions of years after the Moon's birth, stray rock fragments ejected by the original impact continued to pelt its surface, creating the craters that now blanket the Moon.

Clementine and Lunar Prospector Data from *Clementine* confirmed that the crust on the side facing Earth is much thinner than on the far side. Data also found that the crust thins under impact basins and showed the location of mascons, concentrations of mass that are located under impact basins. What do you think they might be? *Clementine* also provided information on the mineral content of Moon rocks. In fact, this part of its mission explains the spacecraft's name. *Clementine* was the daughter of a miner in the ballad "My Darlin' Clementine."

Reading Check What are mascons?

In 1998, the *Lunar Prospector* spacecraft orbited the Moon, taking photographs of the lunar surface. Maps made using these photographs confirmed the *Clementine* data. Also, data from *Lunar Prospector* confirmed that the Moon has a small, iron-rich core about 600 km in diameter. *Lunar Prospector* also conducted a detailed study of the Moon's surface searching for clues as to its origin and structure.

Origin of the Moon

Prior to the data obtained from the Apollo space missions, there were three theories about the Moon's origin. The first was that the Moon was captured by Earth's gravity (the capture theory). It had formed elsewhere and wandered near Earth. The second theory was that the Moon condensed from the same loose material that Earth formed from during the early formation of the solar system (the binary accretion theory). The third theory was that a glob of molten material was ejected from Earth while Earth was still molten (the fission theory). Ironically, the goal of one Apollo mission was to help determine which of these theories was correct. Instead, the mission showed that none of the three theories can explain the Moon's composition.

Differentiated Instruction

Behaviorally Disordered Have teams of students make illustrated posters, each showing one stage in the formation of the Moon. Display posters in the correct order to show all the stages in the formation of the Moon according to the giant impact theory. **L2 IS Visual-Spatial**

Visual Learning

Figure 19 Help students understand the theory being presented in **Figure 19**. A Mars-sized body impacted a young Earth at a glancing angle. The cores of the two bodies and most of the other material merged to form a new Earth. Material that was thrown far enough away from Earth later condensed to form the Moon. **L2**

Some material fell back to Earth, some escaped into interplanetary space, and some orbited Earth as a ring of hot gas and debris.

Solid particles eventually condensed from the cooling gas and the Moon began to accumulate.

Giant Impact Theory Data gathered by the *Apollo* missions led many scientists to form a new giant impact theory, which has gained wide acceptance among astronomers. According to this theory, the Moon formed about 4.6 billion years ago when a Mars-sized object collided with Earth. After colliding, the cores of the two bodies combined and settled toward the center of the larger object. Gas and other debris were thrown into orbit. Some fell back to Earth, but the remainder condensed into a large mass, forming the Moon. This sequence is shown in **Figure 19**. This theory helps to explain how the Moon and Earth are similar, yet not similar enough to have formed from the same condensing mass. If the core of the Mars-sized body was added to the core of Earth, this explains why the Moon's composition is like Earth's mantle and why the Moon has a much smaller central core than expected.

section 3 review

Summary

How does the Moon affect Earth?

- The Moon and the Sun affect Earth's tides.
- As the Moon revolves, different amounts of the side facing Earth are lighted by the Sun, causing the changing phases.
- The alignment of Earth, the Moon, and the Sun produces eclipses.

The Moon's Surface and Interior

- The Moon's surface has craters, mountains, and maria.
- Maria are the dark-colored, relatively flat regions on the Moon.
- The *Clementine* and *Lunar Prospector* found evidence of water-ice on the Moon.

Self Check

1. **Compare and contrast** solar and lunar eclipses.
2. **Explain** tides in Earth's oceans.
3. **Diagram** the positions of Earth, the Moon, and the Sun during a full moon.
4. **Describe** how lunar maria might have formed.
5. **Think Critically** Why is it so important to future space exploration if the Moon has water-ice near its surface?

Applying Math

6. **Calculate** An estimate of the amount of water frozen at the Moon's south pole is $100,000 \text{ m}^3$. If this deposit was spread over an area measuring 160 m by 125 m, how many meters deep would the deposit be?

More Section Review fl.gpscience.com

SECTION 3 Earth's Moon 207

section 3 review

1. Both are eclipses involving Earth, the Moon, and the Sun. A solar eclipse occurs when the Moon's shadow falls on Earth. A lunar eclipse occurs when the Moon moves into Earth's shadow.
2. Tides are one large water wave in Earth's oceans caused by the gravities of the Moon and the Sun.
3. Student diagrams should show the Moon on the opposite side of Earth from the Sun.
4. Large meteorites struck the Moon, forming large depressions and cracking its surface. Magma from inside the Moon flowed onto the surface and filled the large depressions.
5. The water-ice could be used by a lunar base, and rocket fuel (oxygen and hydrogen) could be obtained from the water-ice.
6. 5 m deep

Post Reading

Reflection Ask students to respond to the following prompts: How have lunar explorations broadened our understanding of the Moon's physical characteristics? How does the Moon affect Earth? In your opinion, should future explorations to the Moon and other parts of space be pursued?

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Divide students into small groups. Have each group of students devise a way to show what happens to cause a solar eclipse or a lunar eclipse.

L2 ELL LS Linguistic

Reteach

Tides Ask students to hypothesize about how tides on Earth would be affected if we had no Moon. **Possible answer:** High and low tides would still occur because of the Sun's gravity. The tidal range between high tide and low tide would be less and there would be no spring or neap tides.

L2

Assessment

Oral Have students discuss why the pull of the Moon's gravity causes higher and lower tides on Earth than does the pull of the Sun's gravity. **Possible answer:** Although the Moon is much smaller than the Sun, it is much closer to Earth. **L2**

Real-World Problem

Purpose Students will use a map of the Moon to locate specific features and Apollo landing sites on the Moon.

Process Skills use a map, identify, interpret scientific illustrations, draw and label, trace

Time Required 40 minutes

Alternate Materials tracing paper

Procedure

Teaching Strategies

- Place a large map of the Moon with features labeled in front of the class.
- Prior to beginning this lab, show students the differences among various lunar features (craters, maria, mountains, and rays)

Tie to Prior Knowledge Ask students if they have ever used their imagination to try to find the ‘man in the Moon.’ Tell them that the dark-colored maria can look like the eyes of a face in the full moon. Mention that other cultures have found a woman, a rabbit, and an ant in the features of the Moon.

Troubleshooting Have students trace an illustration of the full moon. They can then label the features and Apollo landing sites on their tracings.

Goals

- Identify** prominent surface features on the Moon.
- Determine** the relative ages of features on the Moon’s surface.
- Locate** the *Apollo* landing sites on the Moon.

Materials

large-scale maps or globes of the Moon
individual, smaller maps of the Moon

Identifying the Moon’s Surface Features and *APOLLO* Landing Sites

Real-World Problem

When you look at a full moon in the night sky, you can see light and dark areas. When you look through binoculars or a small telescope, you can see many craters and the large, dark-colored maria. Many craters are named after great philosophers and scientists. The maria are named for what early scientists thought they saw there; for example, *Oceanus Procellarum* means “ocean of storms.” Can you tell the difference between an old crater and one that has formed more recently? If craters are seen on a maria, which of the features is older? If one crater partially covers another, which one formed first?

Procedure

- Obtain a large-scale map or globe of the Moon.
- Familiarize yourself with some of the more prominent surface features of the Moon.

Alternative Inquiry Lab

Modeling the Moon Students could construct a 3-D model of a section of the Moon’s surface to extend the investigation of specific features and *Apollo* landing sites on the Moon’s surface. They could place a thin layer of modeling clay that covers a spherical ball. Craters and maria could be impressions on the surface with mountains being areas where additional clay is placed. Students could use

a Moon map or globe to determine the scale to be used on their models. They might want to concentrate on just one of the landing sites and include as much as possible about the lunar topography around the specific landing site. For example, *Apollo 15* would enable students to show the relative altitude of mountains on the Moon.

Using Scientific Methods

- Look for examples of younger craters (those with sharp sides and peaks in the center) and examples of older craters (those whose sides are worn down or missing).
- Using a large-scale, labeled map or globe of the Moon, locate, identify, and label the following prominent surface features of the Moon and *Apollo* landing sites on a copy of the Moon's surface. (If an unlabeled Moon map is not available, draw one and illustrate and label the features listed below.)

Features on the Moon

Maria	Craters	Mountain Ranges	Apollo Landing Sites
Mare Crisium	Alphonsus	Alps	11-Mare Tranquillitatus
Mare Frigoris	Aristarchus	Apennine	12-Oceanus Procellarum
Mare Imbrium	Clavius	Caucasus	14-Fra Mauro
Mare Serenitatis	Copernicus	Jura	15-Mt. Hadley
Mare Tranquillitatus	Fra Mauro	Mt. Hadley	16-Descartes
Oceanus Procellarum	Grimaldi		17-Taurus Littrow
	Kepler		
	Plato		
	Tycho		

Analyze Your Data

- Describe** the specific lunar features you studied and what you learned from them.
- Identify** one specific observation that helped you decide which of two features formed first.

Conclude and Apply

- Infer** from your study of the large-scale map or globe whether Copernicus Crater or Grimaldi Crater is older. Do the same for Fra Mauro Crater and Tycho Crater. **Explain** your answers.
- Research** the *Apollo* missions and **explain** why there is no landing site for *Apollo 13*.

Communicating Your Data

Compare your map of the Moon with the maps labeled by other students in your class. **Discuss** why individual maps may be labeled differently or why map illustrations might look different.

LAB 209

Communicating Your Data

Instruct students to view the Moon through a pair of binoculars or a small telescope. Ask them to locate as many of the features they have written on their maps, as they can see. Have students share what they observed on the Moon with other classmates.

Differentiated Instruction

Learning Disabled Provide small or book-sized maps for your students who have learning disabilities. Trace a copy of a map of the full moon and provide a copy of the tracing for your students to use. **L1 ELL Visual-Spatial**

Analyze Your Data

Expected Outcome Students will draw and label a map (or a tracing of a map) of the Moon. Students will find all features and *Apollo* landing sites listed in this lab.

Answers to Questions

- Answers will vary. Students may mention differences among craters or interest in *Apollo* landing sites.
- Again, answers will vary but should mention differences in crater appearance (sharp or worn sides) and superimposed craters.

Error Analysis Possible sources of error are students not realizing that maria are colored darker than highland areas of the Moon and that craters can form on maria and on top of other craters. Ask students where on their maps they located Tycho crater. This crater has bright rays radiating out from it over long distances on the Moon's surface.

Conclude and Apply

- Copernicus crater is younger than Grimaldi crater. Tycho crater is younger than Fra Mauro. Younger craters have steep sides and often show central peaks. Older craters have been weathered by continued impacts.
- Apollo 13* experienced a failure on route to the Moon. One of its fuel tanks exploded and the fuel that remained in the Command Module and Lunar Excursion Module was used to power the spacecraft around the Moon and its return trip to Earth.

Assessment

Process Ask students to use a map of the Moon to locate Ptolemaeus crater and Mare Humorum. **L2 ELL Visual-Spatial**

LAB 209

Oops! Accidents in SCIENCE

SOMETIMES
GREAT
DISCOVERIES
HAPPEN BY
ACCIDENT!

Content Background

Newton worked with optics from 1670 to 1672. He was the first to realize that the colors produced when light passes through a prism are inherent in the light. Before this, it was believed that the colors of the spectrum were added by the prism.

In Newton's time, the borders between science and alchemy were not sharply defined. Newton himself believed in the existence of an ether that transmits forces between particles and in what was then the "occult idea" of action at a distance. Such erroneous beliefs possibly aided him in developing his ideas of gravity. Because of his contributions in mechanics, optics, and mathematics, Newton is often ranked foremost among scientists.

Analyze the Event

Today we know that refraction and dispersion occur because the light passes through substances of different density. What examples of this have you seen in everyday life and what are substances involved. **Possible Answers:** Students may mention seeing rainbows, either in the sky or in the spray of a garden hose, seeing colors as light passed through hanging glass pieces on lamps, seeing colors in a puddle covered by an oil slick.

Discussion

Ask students how a person like Newton who discovered so many basic scientific principles could have considered alchemical or occult ideas. Help them to see Newton in the context of his time and to see that even great scientists can make mistakes.

Even Great Scientists Make Mistakes

"If I have been able to see further, it was only because I stood on the shoulders of giants."

—Sir Isaac Newton

Today, scientists know that sometimes light behaves like a wave and at other times it behaves like a particle. However, early scientists believed it had to be one way or the other. Sir Isaac Newton, 1642–1727, believed in the particle nature of light. Based on his observations and a few erroneous assumptions, he eventually invented what is now called the Newtonian reflecting telescope.

Where did Newton go wrong?

One erroneous assumption involved the behavior of light as it passes through matter such as glass, a property known as chromatic aberration. White light is composed of many different wavelengths that can disperse when refracted. This also happens with telescopes

because lenses act like a combination of many prisms and disperse white light into the colors of the rainbow. We now know that the larger the lens, the less of a prob-

lem this dispersal of light causes. Newton thought the opposite was true. He tried to eliminate chromatic aberration by changing or adding lenses and using prisms, but was unable to correct the problem.

Another mistake made by Newton was that he assumed light particles begin to refract before they contact matter. Because of these assumptions, he concluded that there was no way to fix the problem. So, he gave up on refracting telescopes and used a curved mirror to focus light. This worked, because light does not disperse when it is reflected. His incorrect assumptions led to the invention of the most-used instrument in astronomy, the reflecting telescope.

Sometimes the greatest discoveries in science are based on incorrect assumptions. But, that's okay—it is called science.

Newtonian Telescope

Try it yourself Experiment with shining light through a prism and reflecting it from a mirror. Try using several different prisms with different angles.

Try it Yourself Students should be able to disperse light using prisms or any angular pieces of glass or plastic. The light refracted by prisms will produce colors; the light reflected by mirrors will not.

Newton's Gift, David Berlinski, Touchstone, 2000

Isaac Newton, by James Gleick, Vintage Books, 2003

Reviewing Main Ideas

Section 1 Earth in Space

1. The fact that Earth always casts a curved shadow, as shown here, is evidence of its spherical shape.
2. When Earth was molten, the force of gravity pulling equally in all directions caused Earth to form into a spherical shape.
3. Earth's rotation and movement of matter in its core cause Earth's magnetic field.
4. Earth is different than other planets. These differences enable life to flourish on Earth.

Section 2 Time and Seasons

1. Earth's rotation and revolution are used to measure time in days and years.
2. During the year, the Sun appears to move on the ecliptic through a background of constellations called the zodiac.
3. Earth experiences changing seasons because locations on Earth receive sunlight for varying amounts of time each day and at varying angles throughout the year, as shown here.

4. The Sun reaches its greatest distance north of the equator on the summer solstice for the northern hemisphere and on the winter solstice for the southern hemisphere.

Section 3 Earth's Moon

1. Tides in Earth's oceans are affected by the gravity of the Moon and the Sun. The Moon's gravity has a greater effect because the Moon is much closer to Earth.
2. Changing positions of the Moon in relation to the Sun cause it to go through a lunar phase cycle every 29.5 days.
3. Solar eclipses occur during a new moon, and lunar eclipses occur during a full moon.
4. Craters, like this one, are depressions on the Moon's surface. Some large depressions may have filled with lava, forming maria.

FOLDABLES Use the foldable that you made at the beginning of this chapter to review the Earth-Moon-Sun system.

Identifying Misconceptions

Demonstration Use this assessment as a follow-up to page F at the beginning of the chapter after students have completed the chapter.

Materials flashlight

Procedure Demonstrate that light from the flashlight that falls on the wall, no matter from what angle, are direct; all light falls directly on the wall. Show that light falling perpendicularly

strikes the wall with more intensity than light from the flashlight that falls on the wall from an angle other than vertical.

Expected Outcome Students will understand that the more vertical the rays are from the Sun, the more intense the light and heat from the Sun is. Students will realize that all rays from the Sun, whether vertical or slanted are direct rays.

Assess

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Match the correct vocabulary word or phrase with each definition given below.

1. dark-colored, relatively flat areas on the Moon
2. Earth spinning on its axis
3. a large wave in Earth's oceans caused by the gravity of the Moon and the Sun
4. a round, three-dimensional object, the surface of which is the same distance from the center in all directions
5. Earth moving in orbit around the Sun
6. eclipse that occurs during a new moon
7. 15°-wide area on Earth's surface in which the time is the same
8. occurs when the Sun is directly above Earth's equator
9. attractive force between two objects
10. yearly path of Earth around the Sun

Checking Concepts

Choose the word or phrase that best answers each question.

11. How long is a month of lunar phases?
 - A) 14 days
 - B) 27.3 days
 - C) 29.5 days
 - D) 365 days

12. During winter solstice in the northern hemisphere, the Sun is directly over which part of Earth?

- A) equator
- B) pole
- C) Tropic of Cancer
- D) Tropic of Capricorn

13. Which movement causes lunar phases?

- A) Earth's revolution
- B) Earth's rotation
- C) the Moon's revolution
- D) the Moon's rotation

14. Which eclipse do you experience if you are standing in the Moon's umbra?

- A) partial lunar
- B) partial solar
- C) total lunar
- D) total solar

15. Which phase occurs when the Moon is on the opposite side of Earth from the Sun?

16. Which material may have been found on the Moon by the *Clementine* spacecraft?

- A) atmosphere
- B) dark-colored rocks
- C) light-colored rocks
- D) water-ice

17. On average, how many degrees of longitude are contained in one time zone?

- A) 0.5°
- B) 15°
- C) 23.5°
- D) 30°

18. Which occurs a few days after a full moon?

- A) waning crescent
- B) waxing crescent
- C) waning gibbous
- D) waxing gibbous

Use the ExamView® Pro Test Bank CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

19. Which season begins around December 21 in Australia?
A) spring C) fall
B) summer D) winter
20. Which forms when small meteorites crash into the Moon?
A) craters C) mountains
B) maria D) cracks

Interpreting Graphics

21. **Make an illustration** showing how magnetic force lines surrounding Earth are similar to those surrounding a bar magnet.

Use the data in the table below to answer question 22.

Earth's Physical Properties

Diameter (pole to pole)	12,714 km
Diameter (through equator)	12,756 km
Circumference (poles)	40,008 km
Circumference (equator)	40,075 km
Average distance to the Sun	149,600,000 km
Average distance to the Moon	384,400 km

22. What is the difference between the diameter of Earth through the poles compared to the equator? How many times farther from Earth is the Sun, compared to the Moon?

Thinking Critically

23. **Infer** why more craters are present on the Moon's surface than on Earth's. *Hint: Consider gravity and the presence of an atmosphere.*
24. **Infer** how seasons would be affected if Earth had no tilt instead of the 23.5° tilt that it has.

25. **Explain** why a lunar base would best be built on a plateau that is always in sunlight.
26. **Form a hypothesis** about why during crescent phases we can often see a dim image of the rest of that side of the Moon. *Hint: Recall the arrangement of Earth, the Moon, and the Sun during crescent phases.*
27. **Form a hypothesis** about how the thickness of the Moon's crust might play a part in the fact that the side of the Moon facing Earth has more maria than the side facing away.

Applying Math

Use the illustration below to answer questions 28–29.

28. **Model to Scale** If you are making a scale model of the Moon (diameter approx. 3,500 km), what scale should you use to obtain a model that is about 35 cm in diameter?
29. **Calculate** Using your scale, what would the thicknesses be, in centimeters, for the near-side crust and the far-side crust?

Interpreting Graphics

21. Student illustrations should show a spherical Earth with magnetic force lines drawn around the planet between the North and South Poles.
22. Earth's diameter through the equator is 42 km more than through the poles. The Sun is 389 times farther than Moon.

Thinking Critically

23. Although Earth's higher gravity would have pulled more meteorites toward it, its atmosphere would have burned many of them up. Also, some fell into oceans and some on land, making craters that eroded or remain covered by vegetation.
24. Weather conditions would vary at different locations on Earth, but there would be no changing seasons.
25. The Sun's rays could be used to produce power.
26. Sunlight reflecting off of Earth lights up the dark portion of the Moon facing Earth. This is called earthlight.
27. Since the Moon's crust is thinner on the side facing Earth, cracks formed more readily allowing lava to seep up.

Applying Math

Math Standards

National: 1, 4, 9

Florida: MA.B.2.4.1

28. 1 cm = 100 km

29. 0.65 cm; 1.5 cm

SCE.2.4.3

7. During which month of the year is Earth farthest from the Sun?
- January
 - April
 - July
 - September

Short Response

SCE.1.4.2

11. What may have caused the great difference in the percentage of CO₂ found in Earth's atmosphere compared to those of Venus and Mars?
12. What causes the auroras?

Extended Response

Gridded Response

SCE.1.4.1

8. If a synodic month is 29.5 days long and a sidereal month is 27.3 days long, how much longer is a synodic month?

Use the illustration below to answer question 9.

165° 150° 135° 120° 105° 90° 75° 60° 45°

San Francisco

New York

SCE.2.4.3

9. If it is 9:00 A.M. in New York city, what time is it in San Francisco?
10. If the collision of two planetary-sized objects (Earth and another object) formed the Moon, why is the Moon's iron core so small compared to Earth's?

Use the illustration below to answer question 13.

13. **PART A** The *Lunar Prospector* discovered possible concentrations of water-ice in the area of the South Pole-Aitken Basin on the Moon. How does location and geographic terrain affect the possibility of finding water there?
- PART B** How might this discovery affect the future of spaceflight?

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubrics on p. 9T.

Extended Response

13. **Part A:** The location of possible sources of water have been found in some of the Moon's crater's. Some craters located near the poles, such as the South Pole-Aitken Basin, do not receive direct sunlight at their bottoms. These locations maintain very cold temperatures that might allow water-ice to remain buried

below the surface without melting or evaporating.

Part B: It could supply the water needs of a Moon base or could be used to extract hydrogen and oxygen for rocket fuel, possibly making flight to other planets more economical and easier.

Section/Objectives	Standards		Lab/Features
Chapter Opener	National	State/Local	Launch Lab: The Size of the Solar System, p. 217 Foldables, p. 217
	See pp. 16T-17T for a Key to Standards.		
Section 1 Planet Motion  2 sessions  1 block 1. Compare and contrast geocentric and heliocentric models of the solar system. 2. Describe each planet's position in orbit around the Sun. 3. Classify planets by location and characteristics.	National Content Standards: UPC. 1-5, A.1, A.2, B.4, D.3, D.4, G.3	Florida Benchmarks: SC.E.1.4.1, SC.E.2.4.3, SC.H.1.4.2, SC.H.1.4.5, SC.H.1.4.6, SC.H.2.4.1	MiniLab: Plotting Retrograde Motion, p. 219 Applying Math: Heliocentric Longitude, p. 220 Integrate Physics, p. 220
Section 2 The Inner Planets  2 sessions  1 block 4. Compare and contrast other inner planets with Earth. 5. Describe important characteristics for each inner planet. 6. Evaluate the success of various missions to Mars.	National Content Standards: UCP. 1-5, A.1, A.2, D.3, G.3	Florida Benchmarks: SC.E.1.4.2, SC.E.2.4.6, SC.H.1.4.1, SC.H.1.4.2, SC.H.1.4.4	Science Online, p. 227 Integrate Chemistry, p. 228 Lab: Interpreting Features of Mars's Surface, p. 230  Video Lab
Section 3 The Outer Planets  2 sessions  1 block 7. Compare and contrast the outer planets. 8. Describe important characteristics for each outer planet. 9. Evaluate the success of NASA missions Galileo and Cassini.	National Content Standards: UCP. 1-5, A.1, A.2, B.4, D.3, D.4, G.3	Florida Benchmarks: SC.E.1.4.2, SC.E.2.4.6, SC.H.1.4.1	Integrate Language Arts, p. 232 What Galileo Saw, p. 233 Science Online, p. 234 MiniLab: Comparing Sizes of Outer and Inner Planets, p. 235
Section 4 Life in the Solar System  2 sessions  1 block 10. Evaluate other planets in the solar system for the possibility of containing life. 11. Examine life forms that exist in exotic locations on Earth. 12. Discuss locations in which life might exist on other planets.	National Content Standards: UCP. 1-5, A.1, A.2, C.3, C.5, C.6, D.3, D.4	Florida Benchmarks: SC.E.1.4.2, SC.E.1.4.3, SC.E.2.4.6, SC.F.2.4.3, SC.H.1.4.3, SC.H.1.4.5, SC.H.3.4.2	Lab: Testing Unknown Soil Samples for Life, pp. 242-243 Science Stats: Night Sky Wonders, p. 244

Section Focus

Section Focus Transparency **That's One Hot Greenhouse!** **Chapter 8**

How can greenhouse global warming, and the greenhouse effect? Global warming is the gradual increase of Earth's surface temperature because the atmosphere does not let some of the Sun's radiation reflect to space. Global warming is occurring because of a build-up of carbon dioxide, and other gases in our atmosphere, greenhouse effect. Venus takes this effect to the extreme, as you can see below.

Venus Greenhouse Effect

1. How is this effect on Earth and Venus similar to a real greenhouse?
2. What might happen on Earth if its surface continued to heat up?

L2

Section Focus Transparency **Holy Comet! That's Halley's comet.** **Chapter 8**

Records indicate that comet every 76 years since 240 B.C. people have viewed Halley's comet. It brings some nighttime, but it brings some spectacular sun orbits, probably more known as the comet. The photographs taken by space shuttle. One of these photos is shown below.

1. Predict if you would see Halley's comet if it were last visible in 1910? How old will you be?
2. Why did scientists say that people were able to see bits and pieces of this comet in 1940?

L2

Section Focus Transparency **40,000 Years Old and Going Strong!** **Chapter 8**

Could you live here? Maybe not. But a type of moss was found that had survived in an extreme like this. Scientists estimated that a local moss had survived for 40,000 years. Could life, then, survive on other worlds with similar conditions?

1. Name several other types of extreme environments in which life exists on Earth.
2. How do you think the moss was able to survive for so long?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Assessment

Assessment Transparency **Period of Orbit and Distance to Sun** **Chapter 8**

Directions: Carefully review the figure and answer the following questions.

1. Which planet is 9.5 AU from the Sun?
A. Uranus
B. Saturn
C. Jupiter
D. Neptune

2. What can you conclude about planet orbits compared to their distances from the Sun?
1. As a planet gets farther from the Sun, its AU decreases.
2. As a planet gets closer to its orbit, it gets farther from the Sun.
3. The longer a planet's orbit, the farther away it is from the Sun.
4. As planets move closer to the Sun, their orbits increase.

3. Estimate a planet's distance to the Sun if it has an orbit of 100 years.
A. 45 AU
B. 6 AU
C. 80 AU
D. 10 AU

Planet Motion

How old are you... on other planets?

Know your Earth birthday? Well, we can't know the age of a planet, but we can tell how old you would be if you were born on another planet.

Before you start, know:

- 1 year on Earth = 1 year
- 1 year on Mars = 687 Earth days
- 1 year on Jupiter = 11.86 Earth years
- 1 year on Saturn = 29.4 Earth years
- 1 year on Uranus = 84 Earth years
- 1 year on Neptune = 165 Earth years

Now, let's find out how old you would be on other planets. Fill in the table below.

Planet	Period of Revolution (in Earth Years)	Calculation	Resulted Age
Inner Planets			
Mercury	88 days		
Venus	225 days		
Earth	365 days		
Outer Planets			
Jupiter	11.86 years		
Saturn	29.4 years		
Uranus	84 years		
Neptune	165 years		
Pluto	248 years		

Take a moment to think... Can the stars tell us?

The teacher

section

**Planet Motion****Heliocentric Model**

Most objects in the solar system rotate and revolve in a counterclockwise direction as viewed from above the north pole of the Sun. From Earth, objects appear to move from west to east. Any apparent motion different from this counterclockwise motion is called retrograde motion. Retrograde motion of Mars was one piece of evidence Copernicus used to support his Sun-centered, heliocentric model of the solar system. Any planet in an orbit farther from the Sun than Earth's orbit will occasionally display retrograde motion because Earth travels more rapidly in its orbit than the superior planets.

Origin of the Solar System

One hypothesis on the formation of our solar system, as well as formation of Sun and other stars, suggests that a nearby star might have exploded, sending shock waves through the nebula from which the solar system eventually formed. The shock waves from the explosion caused the particles in the cloud to condense, leading to gravitational instability that caused the cloud to fragment into smaller and smaller pieces. One of these fragments eventually formed into the solar system. Whether this shock was the cause or not, scientists agree that

something had to initiate the process within the nebula that eventually formed the Sun and most likely several other stars. Perhaps the movement of one of the arms of the Milky Way through the nebula started the formation process.

section

**The Inner Planets****Venus, Earth, and Mars**

When secondary atmospheres formed, temperatures on Mars were low enough that H_2O most likely condensed as ice, thus no greenhouse effect could develop on Mars. However, Earth's temperatures were warm enough to allow H_2O to condense as liquid water.

Carbon dioxide (CO_2) dissolves in water; therefore, much of the CO_2 in Earth's atmosphere has been removed by rain. If no liquid water existed on Earth, the amount of CO_2 in the air would probably be similar to that in Venus's atmosphere.

On Venus, the high temperatures caused H_2O to evaporate and no liquid water remained to dissolve the CO_2 in the atmosphere. The combination of H_2O vapor and CO_2 caused a runaway greenhouse effect.

If Earth were just 5 percent closer to the Sun, it would have evolved like Venus—something to consider when searching for life elsewhere.

section The Outer Planets

3

Jupiter, Saturn, and Uranus

The atmospheres of Jupiter and Saturn contain three distinct layers. The upper layer is composed of ammonia ice; just below this is a layer of ammonium hydrosulfide ice, and the lowest cloud layer is composed mostly of water ice.

Unlike the other jovian planets, Uranus doesn't appear to have an internal heat source. Some scientists believe a collision with another object may have turned Uranus on its side and destroyed its heat source.

Other Objects in the Solar System

Comets appear to orbit the Sun in the Oort comet cloud some 50,000 AU from the Sun. Some comets take more than one million years to complete one orbit. The Oort comet cloud is most likely where long-period comets originate. Short-period comets (those taking fewer than 200 years to orbit the Sun) are thought to originate in the Kuiper Belt beyond the orbit of Neptune.

The Kuiper Belt is thought to extend about 30 AU outward from the orbit of Neptune to about a distance of 100 AU from the Sun. Some scientists believe that the retrograde revolution of Neptune's moon, Triton, indicates that it was captured by the gravity of Neptune and could once have been a planet like Pluto. In fact, Pluto and Charon might have been members of the Kuiper Belt. One Kuiper Belt object, 28,978 Ixion is about 1,000 km across and has the same type of orbit as Pluto. Its closest approach to the Sun is 29.8 AU (Pluto's is 29.7 AU) and its farthest distance is 49 AU (Pluto's is 49.3 AU).

Another group of objects from which comets could originate is known as the Centaurs. These objects have elliptical orbits and are located in the region extending from Saturn to Neptune.

section Life in the Solar System

4

Europa

Europa's crust of ice is cracked but smoother than expected, and has hardly any large craters. Some areas of Europa's crust appear to have floated around like icebergs. Photographs show ice flows and systems of ridges. It is thought that gravitational pulling and pushing between Jupiter and its larger moons generated the heat to melt Europa's interior, smooth Europa's crust, and possibly supply energy needed for life to begin and survive on Europa. For life as we know it on Earth to form on Europa, the oceans would have to contain molecules with C, H, O, and N.

Home Sweet Home

Nestled within one of the great spiral arms of the Milky Way lies our solar system. As large as the solar system is, it is still only a tiny fraction of our galaxy!

Science Journal In your Science Journal, write a hypothesis about whether life might exist beyond Earth, or even beyond the solar system, and how you would test for it.

216

Theme Connection

Scale and Structure The solar system has an overall structure, with smaller inner planets and generally larger outer planets. The entire solar system lies within a large cloud of comets that completely surrounds the Sun, the planets, the asteroids, and many other objects. The theme of scale is emphasized when comparing the inner with the outer planets.

About the Photo

Imaginary View From Afar This page shows an illustration of our solar system because a photograph cannot show the entire solar system. The Sun, Mercury, Venus, Earth, and Mars are surrounded by a broad asteroid belt. Jupiter and Saturn are in the foreground, Uranus and Neptune are in the background, and Pluto and Charon are in the upper left.

Start-Up Activities

The Size of the Solar System

Even if you consider only the planets, the solar system is enormous compared to things you see in your daily life. You may be better able to understand the size of the solar system by using a scale model. Distances between the orbits of the nine planets usually are measured in astronomical units (AUs). One AU equals 150 million km, the average distance between Earth and the Sun. Using a scale of 1 AU = 10 cm and the data from the table below, draw a model of the solar system.

Planet	Distance to Sun (AU)
Mercury	0.39
Venus	0.72
Earth	1.00
Mars	1.52
Jupiter	5.20
Saturn	9.54
Uranus	19.19
Neptune	30.07
Pluto	39.48

1. Obtain a roll of adding-machine tape at least 4 m long. Place a symbol for the Sun on one end of the tape.
2. Using the scale above, measure and place the name of each planet at its proper distance from the Sun.

3. Think Critically In your Science Journal, explain how a scale model helped you to visualize the size of the solar system.

FOLDABLES™ Study Organizer

The Solar System Make the following Foldable to help you organize information about the planets.

- STEP 1** Collect five sheets of paper and layer them about $\frac{1}{2}$ inch apart vertically. Keep the edge level.

- STEP 2** Fold up the bottom edges of the paper to form ten equal tabs.

- STEP 3** Fold the papers and crease well to hold the tabs in place. Staple along the fold. Label each tab with the names of the nine planets and Sedna.

Organize As you read the chapter, write information about each planet on its sheet.

Preview this chapter's content and activities at fljppscience.com

Purpose Use this Launch Lab to introduce students to the size of the solar system. [L2]

Preparation Cut 4.5-m sections from a roll of adding machine tape.

Materials adding machine tape, meterstick, metric ruler

Teaching Strategy Have students work in pairs.

Think Critically

Possible answer: The solar system is very large. A scale model is needed to show the relative positions of all planets. To do this, at least 40 m of tape are needed.

Assessment

Oral Could you use the same scale if you wanted to add the planets to your model? Explain. Possible answer: No, the planets would all be very small on the scale used in this lab. [L2]

FOLDABLES™ Study Organizer

Chapter 8

Knowing the locations of different celestial bodies at various times of the year doesn't just assist NASA scientists in figuring out where to send their space probes; it also assists ground-level astronomers in determining where to site their telescopes to look for these objects. Plotting heliocentric longitude is one tool astronomers can use.

- Which planets do you think would be easier to find today (or tonight)?
- Which planet(s) would we not be able to see, even with the most powerful telescopes?

Reading Preview

Tie to Prior Knowledge

Planet Movement Have students think about how stars, planets, the Moon, and the Sun appear to move across the sky. Discuss why people thought Earth was in the center of the universe. Possible answer: Seeing all objects move across the sky made people think they all moved around Earth. L2

Morphological Word Analysis

Write *geocentric* and *heliocentric* on the board. Tell students that the prefix *geo-* means "Earth", *helio-* means "Sun", and *centric-* means "centered upon". In this section, they will read about two early theories of the solar system—geocentric and heliocentric. Have students infer what the theories might be. L2

Reading Guide

FCAT Vocabulary

What You'll Learn

- Compare and contrast geocentric and heliocentric models of the solar system.
- Describe each planet's position in orbit around the Sun.
- Classify planets by location and characteristics.

Why It's Important

Understanding the solar system helps you understand Earth's position in space.

Review Vocabulary

ellipse: an oblong, closed curve drawn around two foci

New Vocabulary

- geocentric model
- heliocentric model
- astronomical unit
- extrasolar planet

Models of the Solar System

Think how difficult it would be to construct a model of the solar system if you didn't know that Earth is a rotating planet. All you can see is the nightly movement of planets across the sky and they all appear to move in a path around Earth. You can understand why many early scientists thought that Earth was the center around which everything they saw in the sky revolved.

Figure 1 Ptolemy presented his geocentric model of the solar system in 140 A.D.

Geocentric Model In the geocentric model of the solar system, Earth is considered the center and everything else revolves around it. You have seen why ancient scientists thought this. Many early Greek scientists explained this by saying that the planets, the Sun, and the Moon were embedded in separate crystal spheres that rotated around Earth. They thought that the stars were imbedded in another sphere that also rotated around Earth. The sphere bearing the stars moved in a regular, predictable way, but those bearing the planets seemed often to move erratically against this background. For this reason, they were called *planasthai*, a Greek word that means "to wander." Our word *planet* comes from this. These ideas led to the model of the solar system devised by Ptolemy, shown in Figure 1.

Geocentric Modifications Although the Ptolemaic model of the solar system was accepted and used for centuries, there were many problems with it. One problem was the fact that planets periodically appear to move in a retrograde, or backward, direction when viewed against a background of stars, as shown in **Figure 2**. Modifications helped, but eventually the model grew very complex.

Heliocentric Model In spite of its complexity, the Earth-centered model held until 1543 when Polish astronomer Nicholas Copernicus published a different view. Using an idea proposed by an early Greek scholar, Copernicus stated that the Moon revolves around Earth, which is a planet, and that Earth and the other planets revolve around the Sun. He also stated that the apparent motion of the planets, the stars, and the Sun is due to Earth's rotation. This is the **heliocentric model**, or Sun-centered model of the solar system, shown in **Figure 3**.

Galileo Using his telescope, Italian astronomer Galileo Galilei found evidence that supported the ideas of Copernicus. He observed that Venus went through phases like the Moon's. These phases could be explained only if Venus orbited the Sun and passed between Earth and the Sun on each orbit. He also saw moons in orbit around Jupiter. These observations convinced him that everything didn't move around Earth, and he concluded that Earth and Venus revolve around the Sun and that the Sun is the center of the solar system.

Figure 3 The heliocentric model of the solar system states that Earth and the other planets revolve around the Sun.

Figure 2 As Earth catches up and passes Mars, Mars appears to move backward, or retrograde.

Plotting Retrograde Motion

Procedure

1. Using **graph paper**, draw and label the following: x-axis, Right ascension, from 12 hours to ten hours; y-axis, Declination, from 0° to 20°.
2. Plot and label these positions of Jupiter: Oct. 1, 2003 (10h 38m, 10°); Jan. 1, 2004 (11h 21m, 6°); April 1, 2004 (10h 51m, 9°); May 1, 2004 (10h 44m, 9°); Aug. 1, 2004 (11h 20m, 6°).
3. Connect the plotted positions in chronological order with a solid line.

Analysis

1. What do you notice about Jupiter's direction of motion?
2. Using a heliocentric model of the solar system, explain why Jupiter appears to move as it does.

Reading Strategy

Clarify Text Have groups of three students model the process described in **Figure 2** by demonstrating the movement of Earth, Mars, and the Sun. Remind them that Earth travels faster than Mars, causing the retrograde effect.

L2 ELL

Differentiated Instruction

Visually Impaired Provide a tracing of **Figure 2** on which key stars have been marked with fingernail polish drops and the lines for right ascension and declination have been marked with wax-coated yarn. L2 ELL

Content Background

In order to understand what we now know to be true about planet positions and movement, students should understand why a geocentric universe was considered to be correct for so long.

2 Teach

Purpose Students will recognize the cause and effect of planetary motion in their orbits around the Sun.

Materials graph paper

Teaching Strategy Use a transparency to show students how to mark the axes. Right ascension is divided into hours and minutes and declination.

Troubleshooting Show students how to locate a place on an Earth globe using longitude and latitude. Compare this to locating objects in the sky using right ascension and declination.

Analysis

1. The direction of Jupiter started to the east, backed up to the west, and then moved east again.
2. Jupiter appears to do this because Earth moves past it in the solar system. When Earth catches and passes Jupiter, the planet seems to move in the opposite direction.

Assessment

Process Have students plot the current positions of Mars, Jupiter, and Saturn on a star chart of the complete sky. **Current** positions are given in astronomy magazines and observer's handbooks.

L2 ELL

Planet Motion If p = the planet's period in years, and d = the planet's distance in AUs the equation then becomes: $p^2 = d^3$.

Jupiter: $d = 5.2$ AU

$$p^2 = (5.2)^3 = 140.6$$

$$p = 11.86 \text{ years}$$

Applying Math

Math Standards

National: 1, 5, 9, 10

Florida: MA.E.1.4.1

Teaching Strategies

- Inform students that the arrow in the diagram points toward the point on the celestial equator where the Sun is on March 21.
- Explain to students that H.L. is the angle between the planet and the position of vernal equinox (first day of spring) in the northern hemisphere.
- Obtain H.L. values for another day from astronomy magazines or an observer's handbook or make up values of H.L. to give students the opportunity to practice.

Answers to Practice Problems

Answers will depend on the values given to the student.

Planet Motion Johannes Kepler devised a system of equations that determine a planet's motion based on its position in the solar system. Use this equation to calculate the orbital period (in years) for Jupiter, which is 5.2 AU from the Sun.

$$(\text{planet's distance in AUs})^3 = (\text{planet's period in years})^2$$

Check your result against the known value.

Understanding the Solar System

Copernicus and Galileo led the way, but many scientists contributed to our understanding of the solar system. Foremost among them is German mathematician Johannes Kepler. In the early 1600s, Kepler discovered that the planets travel around the Sun in ellipses, not circles, as Copernicus had believed. Kepler also learned that the planets travel at different speeds in their orbits. The closer a planet is to the Sun, the faster it travels. This means that the outer planets take more time to orbit than the inner planets. Mercury takes just 88 days to complete one orbit, or period, but Pluto takes over 248 years to complete an orbital period.

To measure the large distances within the solar system, astronomers use a different unit. This is the **astronomical unit** (AU), which equals the average distance from Earth to the Sun, about 150 million km.

Applying Math

Use Geometry

HELIOCENTRIC LONGITUDE (H.L.) This is the position of a planet on any day of any year. It is plotted by measuring the angle between a line of the spring equinox in the northern hemisphere and the position of the planet on its orbit. This measurement is done counter-clockwise because that is how planets appear to move when viewed from above the north pole of Earth. Plot the heliocentric longitudes given below.

IDENTIFY known values and the unknown value

Identify known values:

H.L. on March 4, 2004 for Mercury, Venus, Earth, Mars, and Jupiter are 344° , 103° , 164° , 84° , and 164° respectively.

Identify unknown values:

the position of each planet marked below

SOLVE the problem

Using this diagram as a model, make a larger drawing on a piece of paper. Use a protractor to measure the H.L. angles and mark the position of each planet on its orbit in the diagram and label it with its name or planet symbol:

Mercury ☿, Venus ♀, Earth ⊕, Mars ♂, and Jupiter ♃

CHECK the answers

Switch papers with another student and use a protractor to check each other's plots.

Practice Problems

For more practice problems, go to p. 879 and visit Math Practice at fl.gpscience.com.

Teacher FYI

Planet Positions Heliocentric longitude (H.L.) is the position of a planet with respect to 0 hours of right ascension. If a superior planet has the same H.L. as Earth, it is positioned on the opposite side of Earth from the Sun. This is known as opposition. Because inferior planets (Mercury and Venus) can never be opposite

from the Sun, they are said to be in inferior conjunction when they have the same H.L. as Earth. Planets with a H.L. that is 180° removed from the H.L. of Earth are said to be in conjunction if they are superior planets and in superior conjunction if inferior planets.

Classifying Planets The nine planets can be classified in several ways. One system uses size and other characteristics. Those similar to Earth are called terrestrial planets, and the giant planets are jovian planets. Pluto is sometimes called terrestrial, but does not perfectly fit either category.

Two other systems classify planets by location. The system used most often classifies planets whose orbits are between the Sun and the asteroid belt as inner planets and those beyond the asteroid belt as outer planets. The other system classifies planets whose orbits are between Earth's orbit and the Sun as inferior planets, and those whose orbits are beyond Earth's orbit as superior planets.

Reading Check What separates the inner planets from the outer planets?

Origin of the Solar System Evidence suggests that the Sun probably formed as part of a multiple star system or star cluster. Scientists hypothesize that a huge cloud of gas, ice, and dust began forming into the present solar system about 4.6 billion years ago. This cloud, called a nebula, might have been as large as a million billion kilometers across. When something in nearby space produced an immense shock wave, the nebula began to condense and fragment because of gravitational instability.

Eventually fragmentation stopped, but contraction continued. The cloud fragment from which our Sun formed was about the size of the entire solar system and was slowly rotating in space. As it continued to contract, the matter in the cloud fragment condensed into less space. As its density became greater, gravity pulled more gas, ice, and dust toward the center. This caused the cloud fragment to rotate faster, which in turn caused it to flatten into a disk with a dense center, as shown in **Figure 4**.

Temperature inside the cloud fragment increased. When it reached about ten million degrees Celsius, hydrogen fused into helium, and the Sun was born. Viewed from above the north pole of the Sun, the nebular disk rotated in a counterclockwise direction. Leftover mass in the outer portions of the disk condensed and formed planets and other objects that continue to revolve around the Sun in a counterclockwise direction.

Figure 4 Our solar system formed from one fragment of a giant nebula in a sequence of contractions and condensations.

SECTION 1 Planet Motion 221

Visual Learning

Figure 4 Help students understand the information presented in **Figure 4**. The nebula fragment was slowly turning in space. As the material in the cloud condensed, it began to flatten into a disk. The center of the disk became hotter and hotter until deep inside the center of the disk, hydrogen

fused into helium. Once fusion began and the energy released began to radiate into space, this fragment was a star, the Sun. The remainder of the disk condensed to form the planets and other objects. **L2 ELL**

Discussion

Classifying Earth All planets can be classified in three ways, except Earth. Have students discuss why Earth is only classified in two ways. What two ways is Earth classified? Why is it not classified in the third way? **Possible answers:** Earth is an inner planet and a terrestrial planet. Earth is not classified as an inferior or superior planet because it is the basis for this classification.

L2 ELL IS Linguistic

Reading Check

Answer the asteroid belt

Quick Demo Extrasolar Planets

Materials yellow softball, small, plastic-foam ball

Estimated Time 5 minutes

Procedure Hold the softball in one hand and the plastic foam ball in the other. Move both objects as if they were in orbit around each other. Move the smaller ball more than the larger one. While doing this, gradually move the two object system across the student's line of sight. Explain how this models the movement of a planet around another star. Ask students to explain how they would know the smaller object is there if it was too close to the larger object to be seen. **Possible answer:** The movement of the larger object back and forth as it moved across our line of sight indicates that another object (possibly a planet) is in orbit around the larger object (a star). **L2 ELL IS Visual-Spatial**

Activity

Classifying Planets Provide students with plastic foam models of two of the planets (Mars and Saturn). Be sure the models conform to the same scale. Have students classify the model planets according to their positions relative to Earth (inferior/superior), their size (terrestrial/jovian), and their position relative to the asteroid belt (inner/outer). **L1 ELL IS Visual-Spatial**

Reading Check

Answer planet orbiting another star

Post Reading

Check Comprehension Have students check their comprehension of Origin of the Solar System by retelling the theory to a partner. Encourage them to refer to the text if needed or use simple drawings in their explanation.

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Show students slides of Mars, Earth, Jupiter, and Saturn. Ask students to classify these planets as terrestrial or jovian. The terrestrial planets would be Earth and any planets close to Earth's size (Mars). The jovian planets would be larger, like Saturn. **L2 ELL**

Reteach

Planet Movement Ask students what was the direction of spin of the original cloud that formed the solar system. Since all planets move around the Sun in a counterclockwise direction—as seen from above, the original cloud was spinning counterclockwise. **L2**

Assessment

Performance Have students draw an illustration of how the cloud from which the solar system formed was moving. The cloud was moving counterclockwise, as viewed from above, and the inner part of the cloud was moving faster than the outer part of the cloud. Use PASC, p. 127. **L2 P**

Figure 5 The planetary system around Upsilon Andromedae is shown below. This star is barely visible to the unaided eye.

Other Solar Systems

Until recently, our solar system was the only one known. Now we know that many other stars also have planets around them. **Figure 5** shows the orbits of three planets around the star Upsilon Andromedae, a yellow star about 44 light-years away. These **extrasolar planets**—planets in orbit around other stars—are helping astronomers learn how planetary systems form.

Astronomers have devised new techniques and instruments to find planets around other stars. So far, they have found over 100 stars that have planetary systems, and many more probably exist. Some of these planetary systems have been found around stars like the Sun, but so far only giant planets similar to Jupiter have been detected. If these large planets exist, scientists say the chances are good that planets of lower mass exist also.

New instruments developed by NASA will look for Earthlike planets around other stars. It is difficult because the low mass of planets like Earth make them harder to find than giant planets. Even so, some of the planets found so far are comparatively low in mass and a few of these have a mass very similar to Neptune's. Scientists hypothesize this indicates that many more planets of even lower mass will be found.

Reading Check What is an extrasolar planet?

section 1 review

Summary

Models of the Solar System

- Geocentric models of the solar system place Earth in the center.
- Heliocentric models of the solar system place the Sun in the center.

Understanding the Solar System

- Planet orbits are ellipses.
- Planets are classified by their positions in the solar system and by their characteristics.
- Planets move around the Sun in a counterclockwise direction.

Other Solar Systems

- Extrasolar planetary systems have been discovered.

Self Check

1. **Compare and contrast** the geocentric and heliocentric models of the solar system.
2. **Explain** how heliocentric longitude is used to show the position of planets in orbit around the Sun.
3. **Classify** planets two ways using their positions in the solar system.
4. **Define** terrestrial planets.
5. **Think Critically** Would a year on Venus be longer or shorter than an Earth year? Explain.

Applying Math

6. **Using Equations** Use the equation (planet's period in years)² = (planet's distance in AUs)³ to find the orbital period of a planet that is 19.2 AU from the Sun.

section 1 review

1. Both are models of the solar system. In the geocentric model, Earth is in the center; whereas in the heliocentric model, the Sun is in the center.
2. Measurements of heliocentric longitude show the angular position of a planet in its orbit around the Sun.
3. Planets can be inferior or superior (based on the position of Earth's orbit) or inner or outer (based on the location of the asteroid belt).
4. planets that are about 16,000 km in diameter (Earth-sized) and Earth-like
5. A year on Venus would be shorter because its orbit lies closer to the

Sun and it takes less time to complete an orbit. Being closer to the Sun, Venus also travels around the Sun at a faster rate.

6. 84 years

MA.B.2.4.1, MA.D.2.4.1

The Inner Planets

Reading Guide

What You'll Learn

- **Compare and contrast** other inner planets with Earth.
- **Describe** important characteristics for each inner planet.
- **Evaluate** the success of various missions to Mars.

Why It's Important

Answering questions about life on other planets helps you better appreciate the unique qualities of Earth.

Review Vocabulary

robot lander: part of a spacecraft that lands on another planet or other object

New Vocabulary

- Mercury
- Venus
- Earth
- Mars

Planets Near the Sun

Recall that not all the gas, ice, and dust in the nebula fragment that formed the Sun was drawn into its core. Remaining gas, ice, and dust particles collided and stuck together, forming solid objects that in turn attracted more particles because of the stronger pull of gravity. Close to the Sun, high temperatures vaporized lighter elements so they could not condense. This explains why light elements are scarcer in planets closer to the Sun than in those that formed farther away. Also, any lighter elements surviving were probably driven from the surface by the solar wind. As a result, small, rocky planets with iron cores formed in the inner solar system.

Mercury

The second-smallest and closest planet to the Sun is **Mercury**. *Mariner 10* was the first American space probe sent to Mercury. During 1974 and 1975, it flew by the planet and sent pictures back to Earth, but only 45 percent of Mercury's surface was photographed. What we can see of its surface looks very much like our Moon's. Mercury is covered by craters, some of which have double rings, as shown in **Figure 6**. Scientists do not yet understand why this is true.

The magnetic field around Mercury, discovered by *Mariner 10*, indicates that Mercury has a much larger iron core than would be expected and is missing some lighter materials you would expect to find in its mantle. One theory is that two similarly sized bodies collided. Their cores merged to form one large iron core, and some of the lighter material vaporized and was lost to space.

Figure 6 The outer ring of this double-ringed crater on Mercury is 170 km across.

That's One Hot Greenhouse!

Have you heard about global warming and the greenhouse effect? Global warming is the gradual increase of Earth's surface temperature because the atmosphere does not allow some of the Sun's radiation to return to space. Global warming is increasing because of a build-up of carbon dioxide and other gases in our atmosphere (greenhouse effect). Venus takes this effect to the extreme, as you can see below.

Venus Greenhouse Effect

1. How is this effect on Earth and Venus similar to a real greenhouse?
2. What might happen on Earth if its surface continued to heat up?

Reading Preview

Tie to Prior Knowledge

Inner Planets Help students recall information about the inner planets. Ask them to write the names of the terrestrial planets in their Science Journals and list one fact about each. Possible answer: Mercury—cratered, Venus—greenhouse effect, Earth—liquid water, Mars—red color L1 ELL

Activate Vocabulary Knowledge Ask students why the vocabulary words are capitalized. Tell them that these are planets in our solar system. The words *Sun* and *Moon* also are capitalized. Remind them that the use of capital letters references a named planet, moon, or star. L1 ELL

Discussion

Messenger In August 2004, NASA sent the first spacecraft toward Mercury since *Mariner 10* flew by the planet in 1975. Have students research and discuss the method that will be employed by NASA to place the *Messenger* spacecraft into orbit around Mercury in 2011. **Possible answer:** To save fuel that would be needed to slow the spacecraft down and go into orbit, NASA will send *Messenger* past Earth, Venus, and Mercury several times so that the gravity of those planets will slow the craft enough to enter an orbit around Mercury [L3]

Fun Fact

Mercury is named for the Roman god of commerce, travel, and thievery. It was given this name because it moves across the sky so quickly. Ironically, its year is only 88 days long, but its day lasts for 176 Earth days.

Reading Check

Answer Venus's clouds produce an intense greenhouse effect

Figure 7 Thick clouds obscure the surface of Venus. This view of the surface was assembled from radar data of *Magellan* and *Pioneer Venus Orbiter* and then colorized.

Figure 8 Radar images of volcanoes with visible lava flows on Venus were captured by the *Magellan* space probe.

Mercury's Surface Mercury's relatively large core and thin outer layers resulted in some extreme differences in its surface terrain. Mercury's large, solid core shrank much more rapidly than its thin outer layers. As the outer layers adjusted, they wrinkled, forming dramatic cliffs as high as 3 km. This is similar to what happens when an apple dries and shrivels up.

Is there an atmosphere around Mercury? Mercury is small, has a comparatively low gravitational pull, and its surface experiences extremes in temperature. These conditions indicate that the planet has no atmosphere. *Mariner 10* and Earth-based observations did find traces of what was thought to be an atmosphere, but turned out to be gases that remain for a while and then leak into space. They are thought to be hydrogen and helium deposited by the solar wind and sodium and potassium vapors that diffuse upward through the crust. Mercury has no true atmosphere. This, along with its closeness to the Sun, causes surface temperatures that vary from 427°C to -170°C.

Venus

Venus, shown in **Figure 7**, is the second planet from the Sun. Venus and Earth are similar in some respects; their sizes and masses are almost the same. However, one major difference is that the entire surface of Venus is blanketed by a dense atmosphere. The atmosphere of Venus, which has 92 times the surface pressure of Earth's at sea level, is mostly carbon dioxide. The clouds in the atmosphere also contain droplets of sulfuric acid, which gives them a slightly yellow color.

Clouds on Venus are so dense that only about two percent of sunlight reaches the planet's surface. However, the solar energy that reaches warms Venus's surface. Then, heat radiated from Venus's surface is absorbed by the carbon dioxide gas, causing what is called a greenhouse effect. Due to this intense greenhouse effect, temperatures on the surface of Venus are between 450°C and 475°C.

Reading Check Why is Venus's surface temperature so high?

In the 1970s, the former Soviet Union sent the *Venera* lander probes to Venus. One photographed and mapped the surface before landing, but after about an hour, was destroyed by the intense heat. In 1995, the U. S. *Magellan* probe sent back radar images that revealed features of Venus, as shown in **Figure 8**.

Science Journal

Water on Mercury Have students write a brief paragraph in their Science Journals about how a planet as hot as Mercury could have deposits of water-ice on it. **Possible answer:** Radar studies of Mercury indicate the presence of a highly reflective material in craters at its poles. Since Mercury is tilted very little, the Sun is never very high in the sky at the poles and some craters remain in darkness all the time. [L2] [L3] **Linguistic**

Visual Learning

Figure 7 Help students understand the information shown in **Figure 7**. The surface of Venus is constantly covered by thick clouds. Explain to students that the only way to get 'pictures' of the surface of the planet is to use radar images. This photograph is a mosaic of radar images pieced together to show the surface of the planet as if it had no clouds. [L2] **ELL**

Earth

The third planet from the Sun is **Earth**, shown in **Figure 9**. Unlike other planets, surface temperatures on Earth allow water to exist as a solid, a liquid, and a gas. Earth's atmosphere causes most meteors to burn up before they reach the surface. Ozone in Earth's atmosphere also protects life from the Sun's intense radiation. Life exists all over the planet. Life has been found on Earth in extreme conditions of temperature and pressure in which scientists would never have guessed it could survive. These finds are encouraging for the possibility of life existing elsewhere in the solar system. You will learn more about this in Section 4.

Mars

The fourth planet from the Sun, **Mars**, is called the red planet because iron oxide in some of the weathered rocks on its surface gives it a reddish color, as shown in **Figure 10**. Other Martian features visible from Earth are the polar ice caps and changes in the coloring of Mars's surface.

Mars is tilted 25° on its axis, which is very close to Earth's tilt. Because of this, Mars goes through seasons as it orbits the Sun, just like Earth does. The polar ice caps, which are made of frozen carbon dioxide and frozen water, get larger during the Martian winter and shrink during the summer. The color of Mars's surface changes according to its seasons.

In fact, both the changing sizes of the ice caps and changes in Mars's surface coloration were observed from Earth long before we ever sent a probe to the planet. Some people saw these changes and thought that life forms such as lichens might exist on Mars and grew more during the summer, thus making the area look darker. We know now that what actually causes this seasonal change in coloration of the Martian surface is wind, not the cyclic nature of plant life. As the seasons change during the Martian year, winds blow the dust around on the planet's surface. When the wind blows dust off one area, it may appear darker.

Figure 9 Seen from space, Earth's white clouds and blue oceans testify to the abundant water that makes life possible.

Figure 10 The dark region below Mars's polar cap in this *Hubble* photograph is composed of pulverized volcanic rock. A swirling storm of water-ice is visible to the left of the polar cap.

SECTION 2 The Inner Planets 225

Make a Model

Terrestrial Planets Provide students with various-sized balls. Have them select different balls to represent the four inner planets and explain their choices. Possible answer: If a softball is used as a model of Earth, then Venus is a softball, Mercury is a ping-pong ball, and Mars is a 5-cm rubber ball (a golf ball will work, but it is slightly small). **L2** **ELL** **IS**
Visual-Spatial

Activity

Colorful Planets Explain to students that a planet's color is dependent on the composition of its surface or atmosphere. Have them draw Earth, Venus, and Mars to scale in their Science Journals and then find out what causes each planet's distinctive color. Have them color their drawings. **L2** **P**

Fun Fact

Mercury's iron core appears to make up about 65% of the planet's mass.

Reading Strategy

Question the Text Tell students that good readers ask questions as they read to make certain they understand. Have them write questions that come to mind as they read Earth. For example: What is the range of temperature on Earth? Is there Life at the South Pole? Discuss the role of questions in understanding text.

L2 **ELL**

Curriculum Connection

Literature Invite students to read a classic work of fiction dealing with Martians or Mars. Examples would be *War of the Worlds* by H.G. Wells, originally published in 1898, *The Martian Chronicles* by Ray Bradbury, originally published in 1946, and the *Red Mars*, *Green Mars*, *Blue Mars* trilogy by Kim Stanley Robinson, published in 1993, 1994, and 1996. Encourage students to discuss in class

what they read. Have them concentrate on how the authors pictured Mars and its possible inhabitants. Have them compare what the authors thought Mars would be like with what we now know it to be. Another discussion could center on the possibility of changing Mars into a more Earthlike planet. **L2** **IS** **Linguistic**

IDENTIFYING

Misconceptions

Air on Mars Because of science fiction books, television shows, and movies, some students might think the Martian atmosphere is breathable. Help students realize that Mars's atmosphere is too thin for humans to survive without a special suit and portable air supply. The density of air at the surface of Mars is about the same as 32 km above Earth's, 3.6 times higher than Mt. Everest. It is about 1 percent of Earth's surface atmosphere.

Visual Learning

Figure 11 Help students understand the information presented in **Figure 11**. The so-called blueberries were discovered on Mars by the *Opportunity* robot rover. Although they are not berries or blue, analysis indicates they are concretions of the mineral hematite. Emphasize the importance of this discovery. On Earth, this type of hematite deposit is usually formed in the presence of standing water. [L2]

Figure 11 These spherical concretions found on Mars provide evidence of Mar's wet past.

Figure 12 These photographs taken by *Mars Global Surveyor* show gullies and channels inside the Newton Basin.

Mars's Atmosphere The Martian atmosphere is much thinner than Earth's and is composed mostly of carbon dioxide with some nitrogen and argon. The thin atmosphere does not filter out harmful rays from the Sun as Earth's atmosphere does. Surface temperatures range from 37°C to -123°C. This temperature difference sets up strong winds on the planet, which can cause global dust storms.

Martian Moons Mars has two small, heavily cratered moons called Phobos and Deimos. Phobos is slowly spiraling inward toward Mars, and is expected to hit the Martian surface in about 50 million years. Deimos, which is smaller, orbits about 23,500 km above the surface.

Was Mars once wet? Currently, Mars appears to be a very dry world, but has it always been dry? Does it have any water now? The *Spirit* and *Opportunity* probes sent to Mars seem to indicate that liquid water was once on the planet and may still be there. **Figure 11**, a photo from *Opportunity*, shows deposits on Mars that have been labeled "blueberries" because of their round shape. These are concretions, most likely composed of hematite. Similar concretions form on Earth in the presence of water. **Figure 12** shows photographs taken in 2000 by the *Mars Global Surveyor* spacecraft. You can see the layering and gullies that look as if they were made by running water. Wind might have formed the layering of sediment and gullies, but more and more evidence indicates that water was once present on Mars. Other formations at the edges of craters suggest that frozen water in Mars's surface may flow outward from time to time, forming the channels. NASA has sent many spacecraft to Mars to find out if Mars is or was once wet.

LAB DEMONSTRATION

Purpose to demonstrate how water-carved channels formed on Mars

Materials large, flat pan; fine-grained sand, plastic beaker, water

Alternate Materials stream table

Preparation Place enough fine-grained sand to completely cover the bottom of the flat pan.

Procedure Tilt the flat pan slightly by placing two books under one end. Gradually pour water from the plastic beaker onto the elevated end of the pan.

Expected Outcome The flowing water will erode a channel and produce an apron of sediment in the flat pan.

Assessment

What did the flowing water do to the sand in the flat pan? What formed where the water stopped flowing? **Possible answers:** a water-carved channel; a delta or apron of sediment

[L2]

NASA on Mars

Mars has been a major focal point of NASA planetary exploration for many years. Although not all missions to Mars have been successful, several missions have returned a great amount of data about our reddish-colored neighbor. One of the earliest missions to Mars was the *Mariner 9* space probe that orbited Mars in 1971–1972. It revealed long channels on the planet that may have been carved by flowing water. *Valles Marineris* (the valley of the Mariners), shown in **Figure 13**, is a large canyon that was discovered by this early mission. It is so large that, if it were on Earth, this canyon would reach from San Francisco to New York City. It probably formed when Mars was still geologically active. *Mariner 9* also found large, extinct volcanoes. One of these, Olympus Mons, is the largest volcano found in the solar system.

✓ Reading Check What is Valles Marineris?

Until 2003, most of the information about Mars came from the *Mariner 9*, *Viking probes*, *Mars Global Surveyor*, *Mars Pathfinder*, and *Odyssey*. The most recent data come from the *Mars Exploration Rover Mission* and its two landers, *Spirit* and *Opportunity*.

The Viking Probes In 1976, the *Viking 1* and *Viking 2* probes landed on Mars at the locations shown in **Figure 13**. Each spacecraft consisted of an orbiter and a lander. The *Viking 1* and *Viking 2* orbiters photographed the entire surface of Mars from orbit, while their landers conducted meteorological, chemical, and biological experiments on the planet's surface. Although initial results of the biological tests provided data that seemed to indicate the presence of life, scientists soon realized that the same data also could indicate chemical reactions. The biological experiments found no conclusive evidence of life in the soil.

The *Viking* landers also sent back pictures of Mars's reddish-colored, barren, rocky, and windswept surface.

Scienceonline

Topic: NASA Missions to Mars

Visit fl.gpscience.com for Web links to information from recent studies of missions to Mars.

Activity List new information you learned about Mars and write about the significance of each discovery in your Science Journal.

Figure 13 Mars's *Valles Marineris* is six to seven times deeper than Earth's Grand Canyon.

SECTION 2 The Inner Planets 227

Teacher FYI

Dust Storms on Mars Winds on Mars can reach speeds of hundreds of kilometers per hour. These winds can pick up loose dust from the Martian surface and produce dust storms that can block out the entire surface. This happened in 1971 when *Mariner 9* went into orbit around the planet. Scientists had to wait for the storm to subside before beginning a detailed study of the planet's surface.

✓ Reading Check

Answer a large canyon on Mars

Use Science Words

Word Meaning Have students research the meaning of *Valles Marineris*. Why was this feature on Mars given this name? Possible answers: Valley of the Mariners; It was first seen by the Mariner spacecraft. L1

ELL

Visual Learning

Figure 13 Help students understand the information presented in **Figure 13**. This photograph of Mars shows *Valles Marineris* and the landing sites of *Pathfinder* and *Viking 1*. *Valles Marineris* is the

largest canyon in the solar system. Although its origin remains unknown, a leading hypothesis suggests that it started as a crack billions of years ago as the planet cooled. L2 ELL

Martian Minerals Deposits of salt could have been left behind by evaporating water. Sulfates also could have been in solution and deposited as the water evaporated. Deposits of salt and sulfates have been found on Earth that were formed by the evaporation of a body of water. Hematite concretions can form on Earth in the presence of standing water. Vugs are openings in rocks in which sulfates, such as gypsum, were deposited as they evaporated from water. Once the sulfates were weathered and eroded away, the openings were left behind.

Research Find examples where vugs were formed on Earth.

Quick Demo

Terrestrial/Jovian Planets

Materials soccer ball, large marble

Estimated Time 5 minutes

Procedure Walk around the room holding a large marble and a soccer ball. Ask students if they know what you are demonstrating. Possible answer: The relative sizes of terrestrial versus jovian planets. The large marble represents a terrestrial planet; the soccer ball represents a jovian planet.

Visual-Spatial

Martian Minerals In addition to “blueberries,” *Opportunity* discovered evidence that water once existed on Mars. It found deposits of salts and high concentrations of sulfur. It also found holes in Martian deposits left behind when a mineral is eroded. Research evidence that indicates water was in *Meridiani Planum*. Write about it in your Science Journal.

Global Surveyor, Pathfinder, and Odyssey Cameras on board *Global Surveyor* showed that the walls of *Valles Marineris*, shown in **Figure 13**, have distinct layers similar to those of the Grand Canyon. They also showed that a vast flat region, resembling a dried-up seabed or mudflat, covers a large area of Mars’s northern hemisphere. Many believe the water is now frozen into Mars’s crust at the poles or has soaked into the ground. In fact, a more recent probe, *Mars Odyssey*, provided evidence for water as frost beneath a thin layer of soil in the far northern and southern parts of Mars.

The *Mars Pathfinder* and its rover, *Sojourner*, gathered data that indicated that iron in Mar’s crust may have been leached out by groundwater.

Mars Exploration Rover Mission Recall the round concretions, called “blueberries,” that indicate water may once have existed on the surface of Mars. These were discovered by the *Opportunity* rover in *Meridiani Planum*. The rover confirmed that the concretions were hematite deposits. The fact that the hematite was deposited on top of other features suggests that it was deposited in a standing body of water. Other deposits of hematite have been found by the *Spirit* rover in *Gusev Crater*. The *Mars Exploration Rover* mission that placed these two landers on Mars provided a great deal of evidence that water existed on Mars in the past. Photographs of the Martian surface taken by the two landers *Spirit* and *Opportunity* are shown in **Figure 14**.

Figure 14 The top photograph of light-colored volcanic rocks and fine-grained soils was taken by *Spirit* in Gusev Crater. The bottom photograph shows *Opportunity*’s landing site on the Meridiani Planum and a rock outcrop about 8 meters away.

Teacher FYI

Mars Mars’ axis is tilted 25° degrees from the orbital plane. This means that Mars experiences seasons as Earth does. However, Mars’s orbit is more elliptical causing summer in the southern hemisphere to be much warmer than summer in the northern hemisphere.

Fun Fact

Each Mars rover (*Spirit* and *Opportunity*) is equipped with 9 cameras or imagers; four Hazcams (engineering hazard avoidance cameras), two Navcams (Navigation cameras), two Pancams (panoramic cameras), and one Science Microscopic Imager.

Martian Meteorites Space probes sent to Mars are not the only way we have learned about our planetary neighbor. Meteorites have been found on Earth that are believed to have been blasted into space from Mars. An interesting discovery was reported in 1996 that caused a lot of debate over the possibility of life on Mars. A meteorite from Mars (ALH84001) that had been found in the Antarctic in 1984 was studied by a group of scientists. They found long, egg-shaped microscopic structures that they thought were fossilized evidence of ancient life on Mars. The meteorite, shown in **Figure 15**, is thought to have been ejected by an impact on Mars about 16 million years ago.

Figure 15 This meteorite fragment found in Antarctica is believed to have been dislodged from Mars by a huge impact about 16 million years ago.

Reading Check How was a meteorite that originated on Mars found on Earth?

A debate began in which many scientists suggested other possible reasons for the egg-shaped structures. They pointed out that processes not related to life might have formed these structures. Although no firm conclusions can be drawn from this evidence, research will continue until data are found to determine whether life exists, or may once have existed, on Mars.

✓ Reading Check

Answer It was blasted off Mars about 16 million years ago, traveled through space, and eventually fell to Earth.

Post Reading

Time-Line Project Have students begin a time-line of space probes that shows what was learned from each mission. It may be helpful for students to write information for each space probe on separate note cards and then arrange them in proper sequence. **L2** **ELL** **LS** **Visual-Spatial**

3 Assess

section 2 review

Summary

Mercury

- Mercury has an extreme range of temperatures, many craters, and long, steep cliffs.

Venus

- The sizes and masses of Venus and Earth are similar.
- The carbon dioxide in Venus's atmosphere has caused an extreme greenhouse effect, creating high surface temperatures.

Earth

- Surface temperatures on Earth allow water to exist as a solid, a liquid, and a gas.
- Earth is the only planet definitely known to support life.

Mars

- Mars has ice caps and surface coloring that experience seasonal changes.
- There is much evidence of water on Mars in both past and present.

Self Check

- Compare and contrast** Mercury, Venus, Earth, and Mars.
- Describe** the atmosphere of Venus.
- Explain** why scientists believe Mars was once a wetter planet.
- Explain** why the *Mars Exploration Rover* mission is considered a success.
- Think Critically** Explain why Mars is a more likely planet for humans to visit than Venus.

Applying Math

- Using Percentages** If the diameter of Mars is 53.3 percent of Earth's diameter (12,756 km), find its diameter in kilometers.
- Converting Units** If Earth takes 365.26 days to orbit the Sun and Mars takes 686.98 days, how many Earth years does Mars take to orbit once around the Sun?

section 2 review

- All are terrestrial planets. Mercury has essentially no atmosphere and like Venus, is very hot. Mars is much colder than the others because of its distance from the Sun and lack of a thick atmosphere.
- Venus's atmosphere is composed mostly of carbon dioxide. It has an

atmospheric pressure 92 times that of Earth at sea level. Clouds contain droplets of sulfuric acid.

- Hematite and other deposits have been discovered which often form on Earth in the presence of water.
- It has discovered evidence that could mean water once existed on Mars.

This was one of its major goals.

- Mars has a thin atmosphere and temperatures more like Earth's. Venus has a very dense atmosphere and surface temperatures of 450°C to 475°C.
- 6,799 km
- 1.88 Earth years

MA.B.2.4.2

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students review the photographs of the Martian surface in this section. What is true about the Martian surface that helps explain the pink color of its atmosphere? **Possible answer:** There is so much red dust in the lower atmosphere that it reflects its color and the sky is pink. **L2** **ELL**

Reteach

"Planet Jeopardy" Provide students with answers about each of the terrestrial planets. Have them form questions to go with each answer. **L1** **ELL**

✓ Assessment

Oral Why does the Martian surface have more craters than are on Earth? **Possible answer:** Meteorites do not burn up in the thin Martian atmosphere like they do in Earth's. Also, much of Earth is covered by ocean, and many meteorites might have landed there. Also, Earth's plate tectonics could have destroyed many craters formed in its early history and vegetation on Earth might conceal meteorite craters.

L2

 Video Lab available for this Lab.

Real-World Problem

Purpose Students will identify Martian features and interpret formation processes.

Process Skills identify, infer, interpret scientific illustrations, make and use tables, observe, recognize cause and effect

Time Required 40 minutes

Safety Precaution Caution students to use scissors with care.

Procedure

Teaching Strategy A high quality photo of Mars's surface for this activity is available at gpscience.com. Also at this site is a link to an Exploring Mars Project, that may interest advanced students. Show photographs of features on Earth that are similar to the ones the students will be looking at on Mars photographs.

Troubleshooting Point out one key surface feature to show students what they are expected to do.

Conclude and Apply

1. Table should resemble the one given in the lab.
2. and 3. Refer to data table.
4. Flowing water or lava formed the flow structures. Channel flow is from NE to SW; Lava flows, NW to SE.
5. from the east

Interpreting Features of Mars's Surface

Much of what scientists have learned about Mars involves interpreting data and photographs obtained from spacecraft that explored Mars. Comparing features found on the surface of Mars to similar features on Earth enables scientists to hypothesize about what may have caused these features. How can you interpret Martian surface features in the classroom?

Real-World Problem

How can you interpret the surface features shown on a photograph of the surface of Mars?

Goals

- **Identify** surface features shown on a photograph of Mars.
- **Interpret** what processes were involved in the formation of these surface features.

Materials

photograph of the Martian surface from NASA
clear-plastic sheet erasable marker
scissors transparent removable tape

Alternate Materials

additional laminated photographs of the Martian surface

Safety Precautions

Procedure

1. Cut the clear-plastic sheet to fit, and tape it over the photograph.
2. Use the erasable marker to mark, trace, or circle the features you can recognize, such as craters, lava flows, flow structures (channels), terraces, and sediment layering.

3. Indicate the direction that a flow of lava or water may have traveled.

Conclude and Apply

1. **Make a table** to show the data you will obtain in this Lab.
2. **List** in your table the features you were able to recognize in the photograph.
3. **Identify** and **list** in your table a process that might have formed each feature.

NASA Photograph MOC2-102

Surface Feature	Formation Process
terraces	water erosion or lava flows
craters	meteorite impact
lava flows	volcanic eruptions
flow structures	water or lava flow
sediment layering	deposition by water or wind
possible volcano	volcanic eruptions

4. **Recognize cause and effect** for the flow structures you identified. Record possible flow material and the direction for flow.
5. **Infer** from which direction sunlight was shining on the Martian surface when this photograph was taken.

Communicating Your Data

Explain to friends, classmates, or your family that this is what NASA scientists do with data obtained from spacecraft.

Assessment

Content Have students work in groups of three to write a poem about the processes that may have formed the features observed in the Mars photograph. Poems may rhyme or not. Use **Performance Assessment in the Science Classroom**, p. 169. **L2** **ELL** **IS** **Linguistic**

Communicating Your Data

Have students discuss with one another any differences in their interpretations of features or the processes that may have formed them. Have them list possible reasons for these different interpretations.

The Outer Planets

Reading Guide

What You'll Learn

- **Compare and contrast** the outer planets.
- **Describe** important characteristics for each outer planet.
- **Evaluate** the success of NASA missions *Galileo* and *Cassini*.

Why It's Important

Studying the outer planets helps scientists to understand the formation of planets orbiting other stars.

Review Vocabulary

space probe: an instrument that is sent to space to gather information

New Vocabulary

- Jupiter
- Saturn
- Uranus
- Neptune
- Pluto
- comet
- asteroid
- meteoroid
- Sedna

Why are the outer planets so different?

Recall how the small, rocky inner planets formed. High temperatures near the Sun prevented the lighter elements from condensing readily, so these elements are scarcer in the planets closer to the Sun. Things were different in the outer portion of the cloud fragment that formed our solar system. There, lighter elements condensed, collided, and stuck together. The growing masses collected still more particles because of the stronger pull of gravity. This produced the giant planets found in the outer part of our solar system. Only Pluto does not fit this description.

Jupiter

The largest and fifth planet from the Sun is **Jupiter**. It is composed mostly of hydrogen and helium, with some ammonia, methane, and water vapor. Scientists theorize that the atmosphere of hydrogen and helium gradually changes to a planetwide ocean of liquid metallic hydrogen toward the middle of the planet. Below this liquid layer may be a solid rocky core much larger than Earth. However, the extreme pressure (about 50 million Earth atmospheres) and temperature (40,000°C), make the core different from any rock on Earth.

You've probably seen pictures of Jupiter's colorful clouds. Its atmosphere has bands of white, red, tan, and brown clouds, as shown in **Figure 16**. Continuous storms of swirling, high-pressure gas have been observed on Jupiter. The Great Red Spot is the most spectacular of these storms. Lightning also has been observed within Jupiter's clouds.

Figure 16 The Great Red Spot on Jupiter in the lower right is a storm that has raged for more than 300 years.

Holy Comet! That's Halley's comet.

Records indicate that about every 76 years since 240 B.C., people have viewed Halley's comet. Although some sightings have been more spectacular than others, probably none has been as striking as the photographs taken by modern spacecraft. One of these photos is shown below.

1. In what year would you be able to see Halley's comet if it were last visible early in 1986? How old will you be?

2. Why did scientists say that people were able to see bits and pieces of this comet in 1998?

Activity

Classifying Planets Have pairs of students make flash cards of the three ways to classify planets. Students should write a planet classification on one side and the planets in the classification on the reverse of the card. Students should quiz each other on planet classification. **L1** **ELL** **Visual-Spatial**

 Reading Check

Answer water may exist under the icy surface

Use Science Words

Word Origin Help students recall that planets can be classified as terrestrial or jovian. Ask students to research the origin of these words and explain their use. Possible answers: terrestrial—of Earth of its inhabitants, from *terra* (Earth); jovian—of Jove (Roman god, Jupiter or planet Jupiter); Planets that are Earth-like are terrestrial; those that are Jupiter-like are jovian. **L1** **ELL**

 INTEGRATE
Language Arts

Naming Moons The names of the four Galilean moons refer to characters in myths about Jupiter, and the names of the moons of Uranus come from works by Shakespeare or Pope. The names of Mars's moons Deimos and Phobos mean panic and fear, respectively.

Figure 17 Jupiter's gravity holds more than sixty moons in orbit. Two of them are shown above.

 INTEGRATE
Language Arts

Naming Moons You may know that the names of all the planets except Earth come from names of Greek and Roman gods. But did you realize that many of the names chosen for moons come from either mythology or literature? For example, Charon was the name of the boatman who carried the dead to the underworld kingdom of Pluto. Research the moons of Mars and find out why their names are appropriate.

However, four are large enough to be considered small planets. Galileo was the first to discover these moons when he looked through his telescope and he drew a picture of what he saw. These Galilean moons of Jupiter are Io, Europa, Ganymede, and Callisto, and are described in more detail in **Figure 18**. One of these, Ganymede, is larger than the planet Mercury and is the largest moon in the solar system.

Io is under a constant tug-of-war between the gravities of Jupiter and Europa. This heats up the interior of Io and causes it to be the most volcanically active body in the solar system. The volcanoes on Io were first seen in photographs from the *Voyager* probes.

The most recent interpretation of the data sent back by the *Galileo* space probe about the other three Galilean moons is that they all most likely have an ocean of water underneath an ice-rock crust. Some scientists speculate that Europa's ocean is very large and could possibly harbor some kind of life. Using gravity and magnetic field measurements, NASA scientists generated a model that shows the existence of water beneath Europa, Ganymede, and Callisto. When *Galileo's* mission ended, NASA chose to send the probe into Jupiter's atmosphere, where it was crushed and destroyed. They didn't want to risk having it crash on Europa and contaminate any life that might exist there.

 Reading Check

Why do scientists think Europa is a good candidate for supporting life?

Space Probes to Jupiter

In 1979, *Voyager 1* and *Voyager 2* flew past Jupiter, and the *Galileo* space probe reached Jupiter in 1995. The major discoveries of these probes include information about the composition and motion of Jupiter's atmosphere, characteristics of some of its moons (including volcanoes on one of them), and the discovery of new moons. The *Voyager* probes also discovered that Jupiter has faint dust rings around it.

Jupiter's Moons Jupiter has more than 60 moons. You can see some of them orbiting the planet in **Figure 17**. Many of these are small, rocky bodies that may be captured asteroids.

 Reading Strategy

Question the Author Tell students that good readers ask questions of the author as they read. Model this strategy after reading Jupiter's Moons by asking: How does the tug of war of gravity between Jupiter and Europa cause Io to heat? Have students develop a question they would like to ask the author. **L2** **ELL**

Figure 18

Galileo Galilei, 1564–1642 In 1610, Italian scientist Galileo Galilei did something revolutionary for his time. Galileo used a telescope to look at the planet Jupiter and saw four objects revolving around it. This and other observations convinced him that our solar system is heliocentric.

Like its namesake, the *Galileo* spacecraft changed our understanding of the solar system. *Galileo* launched a probe into Jupiter's atmosphere, which gathered data about cloud layers, chemical composition, and lightning.

Ganymede, the largest moon in the solar system, is larger than the planet Mercury. It has grooves covering its surface that indicate a violent past. These grooves most likely resurfaced over time through volcanic activity.

Callisto is marked by one giant crater called Valhalla, which was formed by an impact over four billion years ago. Callisto has a thin atmosphere of carbon dioxide and most likely has an ocean of salty water surrounding its interior of ice and rock.

Io is caught between Jupiter's tremendous gravitational force and the gravity of neighbor Europa. It is the most volcanically active object in the solar system.

Europa is mostly rock with a thick, cracked but smooth crust of ice.

SECTION 3 The Outer Planets 233

Visualizing Jupiter's Galilean Moons

Have students compare what Galileo, the man, saw compared to what *Galileo*, the spacecraft saw by examining the pictures and reading the captions. Then ask the following questions.

What is true about the number of craters seen on the four Galilean moons? **Possible answer:** The farther a moon is from Jupiter, the more craters it has.

Which moon is the most geologically active? **Possible answer:** Io

Which moon shows cracks on its surface that may have been caused by tidal pulls from Jupiter on an ocean underneath? **Possible answer:** Europa

Have students examine the pictures and read the captions. Then ask the following question.

Explain how Galileo's discovery of these satellites provided evidence for the Copernican theory? **Possible answer:** Copernicus believed all solar system bodies revolved around the Sun, rather than the Earth. Galileo's discovery demonstrated that at least four solar system bodies did not revolve around the Earth.

Activity

What Galileo Achieved The *Galileo* mission increased scientific understanding of Jupiter and its moons. Have students research the mission and create a poster, booklet, or multimedia presentation describing some of *Galileo*'s major findings. **L2 P**

Differentiated Instruction

Visually Impaired Have a student helper read the text about Galileo and about each moon described. Have the helper show enlarged images of those in this feature to the other student. Encourage the helper to discuss what is

shown in each image with the other student. For example, the helper can point out the fact that active volcanoes are evident on Io. This can help the visually-impaired student "see" the image.

L2 ELL

Discussion

Saturn's Rings Tell students that the Roche Limit is a critical distance from a planet below which gravitational forces of the large planet overcome a moon's internal gravity and the moon is torn apart. Smaller moons (less than 10 km) can exist inside a planet's Roche Limit because they are held together by interatomic forces, not gravity. Ask students to explain whether they believe Saturn's Roche Limit lies inside or outside its ring system. **Possible answer:** Inside the Roche Limit, moons larger than 10 km in diameter were pulled apart by Saturn's gravity and the pieces formed rings around the planet. Thus Saturn's ring system lies inside the Roche Limit. **L3**

Fun Fact

The *Cassini-Huygens* spacecraft began a four-year study of Saturn and its moons on July 1, 2004. The *Cassini-Huygens* Mission is an international program. It involves NASA, the European Space Agency, and the Italian Space Agency.

Activity

Planet Flash Cards Have students make flash cards of the nine planets. On one side of the card, they should draw the planet and name it. On the reverse of the card, they should list three or four facts about the planet. Have students work in teams of two to quiz each other on planet characteristics. **L2 ELL AS Visual-Spatial**

Figure 19 *Cassini-Huygens* provided detailed views of Saturn and its rings.

ScienceOnline

Topic: Discoveries of *Cassini-Huygens*

Visit fl.gpscience.com for Web links to information about discoveries made by the *Cassini* and *Huygens* probes at Saturn.

Activity Write a paragraph describing new discoveries made by *Cassini* space probe about Saturn.

Figure 20 *Cassini* produced this image by filtering starlight through Saturn's rings. The bands of color represent changes in ring density as rings are affected by the gravity of two of Saturn's moons.

Saturn

NASA began a new study of Saturn when the *Cassini-Huygens* spacecraft reached Saturn in July 2004. The spacecraft's arrival, insertion into orbit, and initial operation went flawlessly. Many data about Saturn, its rings, and its moons were collected during its approach. **Saturn**, shown in **Figure 19**, is the sixth planet from the Sun and is known as the ringed planet. It is not the only ringed planet, but it has the largest and most complex ring system. Based on *Cassini-Huygens* data, Saturn could have at least 34 moons. Although Saturn is the second-largest planet in the solar system, it has the lowest density. This is because Saturn's gravitational pull is weaker than Jupiter's—Saturn's cloud layers are not squeezed as close together as cloud layers in Jupiter's atmosphere are.

Like Jupiter, Saturn is a large planet with a thick outer atmosphere composed mostly of hydrogen and helium with some ammonia, methane, and water vapor. As you go deeper into Saturn's atmosphere, the gases gradually change to liquid hydrogen and helium. Below its atmosphere and liquid ocean, Saturn may have a small rocky core, but no rocky surface like Earth's. When compared to Earth, the pressures and temperatures at the core must be tremendous.

Saturn's Rings Saturn's rings are composed of countless ice and rock particles ranging in size from a speck of dust to tens of meters across. The rings appear as several broad bands, each of which is composed of thousands of thin ringlets.

As *Cassini-Huygens* entered its orbit around Saturn, it took close-up pictures of these rings that showed a density wave, just as had been predicted by physicists, as shown in **Figure 20**. Also shown in this figure, are areas where the ring material bends up and down. Other *Cassini-Huygens* photographs showed that the gravity of Saturn's moons affects its rings and the presence of a new ring associated with the moon, Atlas.

***Cassini-Huygens* at Saturn** *Cassini-Huygens* is actually two spacecraft in one. *Cassini* was programmed to orbit Saturn for over four years and to release a probe named *Huygens* when it passed Saturn's moon Titan. *Huygens* was designed to descend through the thick atmosphere of Titan and land on its surface. You will learn more about Titan later.

Teacher FYI

Uranus If you know exactly where to look on a dark night, Uranus is visible to the unaided eye. Even in large Earth-based telescopes, it appears as just a tiny greenish disk. Because its rotational axis is tilted 98°, the poles of Uranus alternately point in the direction of the Sun.

Uranus

After touring Saturn, *Voyager 2* flew by Uranus in 1986. **Uranus**, shown in **Figure 21**, is the seventh planet from the Sun and wasn't discovered until 1781. It is a large planet with 27 moons.

Uranus's axis of rotation is tilted on its side, so that it is nearly perpendicular to the plane of its orbit. This may have happened as the result of a collision with another object. *Voyager* also revealed numerous thin rings, and detected that the planet's magnetic field is tilted 55 degrees from its rotational poles.

The atmosphere of Uranus contains hydrogen, helium, and about two percent methane. The methane gives the planet its blue-green color because methane absorbs red and yellow light, and the clouds reflect green and blue light. No cloud bands and few storm systems are seen on Uranus because of its cold upper atmosphere. This lack of bands and storms may be connected to the fact that Uranus has less internal heat than Neptune. Evidence suggests that under its atmosphere, Uranus has a mantle of liquid water, methane, and ammonia surrounding a rocky core.

 **Reading Check** What causes Uranus to have a blue-green color?

Neptune

From Uranus, *Voyager 2* traveled on to Neptune. **Neptune**, another large planet similar in size to Uranus, is the eighth planet from the Sun. Neptune, also shown in **Figure 21**, was discovered in 1846 when studies of Uranus's orbit indicated that the gravity of another unseen planet must be pulling on it. Under its atmosphere, Neptune is thought to have liquid water, methane, and ammonia covering a rocky core. *Voyager* also detected that Neptune has rings that are thin in some places and thick in others.

Neptune's atmosphere is similar to that of Uranus, but has a little more methane—about three percent—causing it to look bluer. Neptune's atmosphere has dark spots similar to the Great Red Spot on Jupiter. With its dynamic atmosphere, Neptune's internal heat must be greater than Uranus's.

Neptune has at least 13 moons. Triton, the largest, has a diameter of 2,700 km and a thin atmosphere composed mostly of nitrogen. Some methane is also present; *Voyager* detected methane geysers erupting on Triton.

Figure 21 Uranus, left, and Neptune, right, are about the same size. Uranus has faint cloud bands and a ring system that are visible only in false color.

Mini LAB

Comparing Sizes of Outer and Inner Planets

Procedure

1. Research the planets to find their diameters in kilometers.
2. Select a scale to draw the planets. The scale must be such that the small planets can be seen and the larger planets can fit your paper.
3. Using your scale, draw a circle with the diameter of the smallest planet.
4. Using the same scale, draw circles representing each of the other planets.

Analysis

1. How do the model sizes of the inner planets compare to those of the outer planets?
2. Which planet is smallest? Largest?

Active Reading

Think-Pair-Share Getting students involved as active participants is key to helping them learn. The Think-Pair-Share strategy allows students to think about a topic and brainstorm what they know about it, pair up to discuss what they know, and finally, get involved in a whole-class share session. Have students use this strategy on a Think Critically question in a Section Review in this chapter.

Differentiated Instruction

Visually Impaired Help your visually impaired students gain understanding from the MiniLAB. Have your visually impaired students work with other students who are using brightly colored pieces of wax-covered yarn to make 3-D drawings of the planets' comparative sizes. Encourage visually impaired students to help build the 3-D models.

 **ELL**

Mini LAB

Purpose Students will compare the relative sizes of the planets.

Materials drawing paper, colored pencils, drawing compasses

Teaching Strategies

- Show students how to use a drawing compass.
- Provide students with the diameters of the nine planets.
- Encourage students to color their planets.

Safety Precaution If drawing compasses are used, caution students to handle them carefully and to place a pad under their drawing paper.

Troubleshooting Try some scales ahead of time to see what size best fits the paper being used.

Analysis

1. Inner planets are smaller than outer planets (except Pluto).
2. Pluto; Jupiter

Assessment

Oral Based on the relative sizes of the planets, does Pluto seem to fit the inner or the outer planets better? *Pluto's size fits better with the inner planets.* 

Reading Check

Answer methane in its atmosphere

Quick Demo

Comets

Materials crushed ice, dirt, small rocks (pebbles)

Estimated Time 10 minutes

Procedure Mix ice, dirt, and pebbles in a pan. Make a dirty snowball that consists of about half ice and half dirt and rock. Explain that comets often are described as dirty snowballs.

Inquiry Lab

Speeding Baseballs and Meteoroids

Question How do the speeds of a thrown ball and a meteoroid compare?

Possible Materials stopwatch, tennis ball, baseball, softball, racquetball, meterstick, calculator.

Estimated Time 30 minutes

Teaching Strategies

- Students should use a tennis ball or racquetball when possible. Students should never throw balls near other students, cars, buildings, or streets.
- Students can measure a 10-m distance and use stopwatches to determine the time it takes for a thrown ball to travel the distance.
- Using the formula for speed, students can calculate the speed of the ball in meters per second. They can derive the mathematical equation for converting m/s to km/s or simply divide their value for speed by 1,000. After converting the ball's speed to km/s, they can compare their value with the range of meteoroid speeds.
- Encourage students to research the orbital velocities for the planets and compare the speed of their ball to these values.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Figure 22 Pluto's moon, Charon, is about half the size of Pluto.

Figure 23 Comets often have two tails—one made of dust and one made of ions.

Figure 24 Asteroid 433 Eros has an irregular shape and is 23 km long. Spacecraft *NEAR-Shoemaker* landed on its surface in 2001.

Pluto

The smallest planet in our solar system and the one we know the least about is Pluto. Because **Pluto** is farther from the Sun than Neptune during most of its orbit, it is considered the ninth planet from the Sun. Although Pluto comes closer to the Sun than Neptune for part of its orbit, the two planets will never collide because Pluto's orbit is inclined farther from the ecliptic plane. Because of this angle, the two orbits cannot intersect.

Pluto is unlike the other outer planets. It has a thin atmosphere and is the only outer planet with a solid, ice-rock surface. Pluto's only moon, Charon, is large compared to Pluto and orbits close to Pluto, as shown in **Figure 22**.

Comets and Other Objects

A **comet** is composed of dust and rock particles mixed with frozen water, methane, and ammonia. As a comet approaches the Sun, it begins to vaporize because of heat from the Sun. The released dust and gases form a bright cloud called a coma around the nucleus, the solid part of the comet. The solar wind pushes on the vaporized coma, forming a tail that always points away from the Sun, as shown in **Figure 23**.

Most comets come from two places—a vast disk of icy comets called the Kuiper Belt near Neptune's orbit and the Oort Cloud, which completely surrounds the solar system. Gravity from the Sun or from passing stars may periodically disturb these areas, sending comets on long journeys toward the Sun. Once in orbit around the Sun, comets reappear at predictable times. One of the most famous of these is Halley's comet, which returns every 76 years.

Asteroids Rocky objects formed from material similar to that of the planets are called **asteroids**. One of these is shown in **Figure 24**. Most asteroids are found in a belt between the orbits of Mars and Jupiter. Asteroids range in size from tiny particles to objects 940 km in diameter.

Meteoroids Other rocky objects orbiting within the solar system are **meteoroids**. They may have formed when asteroids collided or when comets passed close to the Sun, leaving a trail of debris. When Earth passes through these trails, meteoroids may enter the atmosphere. Most burn up completely and we see them as meteors or "shooting stars." Others do not burn completely and strike Earth. These are called meteorites.

Teacher FYI

NEAR-Shoemaker On February 14, 2000, the *NEAR-Shoemaker* spacecraft went into orbit around asteroid 433 Eros. It showed that Eros was composed of solid rock, probably primitive, solar system material. The *NEAR-Shoemaker* spacecraft later successfully survived a low-velocity landing on the asteroid and sent radio signals to Earth for 16 days.

Cultural Diversity

Japan in Space Japan launched two spacecraft that studied Halley's Comet in 1986. The spacecraft were the *Sakigake* spacecraft which studied Halley's Comet from a distance of 6.88 million km and the *Suisei* which conducted a flyby at a distance of 151,520 km. Have students research current space missions conducted by the Japan Aerospace Exploration Agency.

Sedna Another object in the solar system that has puzzled astronomers is Sedna, shown in **Figure 25**. Sedna has been labeled a distant planetoid and with a diameter of 1,200 to 1,700 km, it is smaller than Pluto, but larger than comets in the Kuiper Belt. Also, it has a very elliptical orbit. Sedna comes as close as 76 AU from the Sun, but travels to a distance of 950 AU—far beyond the Kuiper Belt, but much closer than the Oort Cloud.

Some suggest that the Sedna's orbit was severely affected by a passing star less than 100 million years after the Sun formed. This supports the idea that our Sun formed as part of a star cluster. A close encounter with another star so soon after the Sun's formation and so nearby (800 AU) could be explained if the Sun formed within a cluster.

Another puzzle is Sedna's apparent rate of rotation of 40 days. This is best explained if the object had another object in orbit around it. Even if Sedna has no companion, there may be other similar objects, some even larger than Pluto, out there. At present, objects this far away and having orbits this elliptical can be detected only when they are closest to the Sun.

Figure 25 Sedna is larger than an asteroid or comet, but smaller than a planet.

Post Reading

Discussion Have students share their questions and answers from their K-W-L Charts. Are there any unanswered questions? Discuss how to do further reading or research to answer these questions. Challenge students to use research materials to gain knowledge about a topic of interest.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Show students pictures of each of the outer planets. Have them identify the planet shown and write at least one fact about each planet. Write comments from students on the board under the name of each planet. Have students check comments on the board for correctness. **L1**

ELL

Reteach

Planet Sizes Have students write the names of the outer planets in order of size from the largest to the smallest. **Possible answer:** Jupiter, Saturn, Uranus, Neptune, and Pluto **L1**

Assessment

Content Have students draw a comet as it would appear when approaching the Sun. **Possible answer:** Student drawings should include a nucleus, a coma, and a tail. Students might show more than one tail; one of ions and one of dust. Use **Performance Assessment in the Science Classroom**, p. 127.

P L2 ELL IS Visual-Spatial

section 3 review

Summary

Jupiter

- Jupiter is the largest planet in the solar system.
- The four largest moons of Jupiter are Io, Europa, Ganymede, and Callisto.

Saturn

- Saturn has the most complex system of rings.

Uranus, Neptune, and Pluto

- Uranus's axis of rotation is tilted on its side.
- Neptune's atmosphere has storms similar to those on Jupiter.
- Pluto has a solid, icy-rock surface.

Comets, Asteroids, and Meteoroids

- The asteroid belt lies between the orbits of Mars and Jupiter.
- Meteoroids form from pieces of comets and asteroids.

Self Check

1. **Compare and contrast** Jupiter, Saturn, Uranus, Neptune, and Pluto.
2. **Explain** what Saturn's rings are composed of.
3. **List** three things scientists learned about Jupiter and its moons from the *Galileo* space probe.
4. **Think Critically** Explain what would happen to the density of Saturn if its atmospheric layers squeezed inward toward the center of the planet.

Applying Math

5. **Use Numbers** If the diameters of Earth and Jupiter are 12,756 km and 142,984 km, respectively, how many Earths could fit across Jupiter's equator?
6. **Use Decimals** On average, if Earth is 150 million km, or 1 AU, from the Sun and Venus is 0.71 AU from the Sun, what is the distance to Venus in kilometers?

More Section Review fl.gpscience.com

SECTION 3 The Outer Planets 237

section 3 review

1. All are outer planets. All except Pluto are gas giant planets. The gas giants have differently colored clouds.
2. Pieces of rock and ice ranging from fractions of millimeters to tens of meters. Most are the size of snowballs.
3. discovery of new moons, volcanic activity on Io, possible ocean under the ice crust of Europa, new data about Jupiter's atmosphere
4. If the atmospheric layers of Saturn squeezed inward toward the center of the planet, the density would increase.
5. slightly over 11
6. 106.5 million km

Reading Guide

What You'll Learn

- **Evaluate** other planets in the solar system for the possibility of containing life.
- **Examine** life forms that exist in exotic locations on Earth.
- **Discuss** locations in which life might exist on other planets.

Why It's Important

The lack of evidence showing that life exists elsewhere helps you realize how important it is to take care of Earth.

Review Vocabulary

fossil: remains, imprints, or traces of past life

New Vocabulary

- extraterrestrial life

Life As We Know It

We know life exists in our solar system. It's all around us; in the air, on rocks, and in the sea, as shown in **Figure 26**. It thrives even in harsh environments on Earth, but does it exist anywhere else in the solar system and, if so, where? What does life need to survive? Life on Earth is carbon-based and requires water to survive. Does water exist elsewhere in sufficient quantities to make life possible?

Think about what you consider to be life. You might think of yourself, your friends, your pet, and maybe birds flying by the window. There is so much diversity to life on Earth. There is life we easily can see, such as grass, trees, and animals, but there is also a multitude of life that we cannot see. For example, microorganisms are so small you need a microscope to see them. When we define life, we might forget about microorganisms but they are very important to us.

If you were asked to check a sample of soil to see if there was or ever had been life in it, what would you do? You might look for moving things, but motion doesn't always mean something is alive. You might look for residues or traces of life that once lived in the soil, such as fossils. You know that you release gases as you breathe. You might check to see if gases are being emitted from the soil. Think about what type of tests you could perform on Martian soil to check for life, and remember that these tests would have to be done by a robot lander.

Figure 26 Tube worms and mussels at this hydrocarbon seep on the floor of the Gulf of Mexico get their energy from bacteria that consume methane. Predators, such as crabs feed on the community.

Reading and Writing Skills Activities, pp. 9–10

Exotic Life on Earth Before we rule out the possibility of life on other worlds, we should take a closer look at life on Earth. Some of the exotic life-forms that exist on Earth are strange, indeed.

In the 1970s, a research submarine, the *Alvin*, found some interesting life-forms while exploring hot, volcanic vents on the ocean floor at depths where light could not penetrate. A variety of life was living where scientists didn't think it could. Life-forms found included crabs, clams, and tubeworms. They were living and thriving in a dark environment under tremendous pressures. *Alvin* also discovered colonies of bacteria living off the extremely hot material spewing from volcanic vents. These organisms use thermal and chemical energy to survive and are the basis of food webs there.

A surprising amount of life has been found elsewhere on Earth in extreme conditions—scalding heat, freezing cold, salt, lye, and darkness. For example, a moss shown in **Figure 27** was dormant for 40,000 years in permafrost in northeastern Siberia. Three forms of bacteria thrive in the mud of Mono Lake, California, where the environment is dark, lacks oxygen, and contains a large amount of salt and lye. What does this tell us about the ability of life to exist in the harsh environments of other planets?

Figure 27 The moss shown to the left is growing again after being dormant for 40,000 years. The photograph above shows a researcher collecting mud samples from Mono Lake, California. One bacteria in this mud obtains energy from chemicals rather than sunlight.

Can life exist on other worlds?

Think about what you have learned about Earth compared to other planets. None of the planets you have studied has characteristics so close to Earth's that you could definitely say life as we know it could exist there. But can you say for certain that life cannot exist on other planets in the solar system?

The high temperatures found on Mercury and Venus and the lack of a surface on Jupiter and the other gaseous giants make finding life as we know it unlikely. But such facts do not rule out the possibility of some form of **extraterrestrial life**, that is, life on other worlds. Let's take a look at some places where scientists are searching for extraterrestrial life.

Reading Check What is extraterrestrial life?

SECTION 4 Life in the Solar System 239

Visual Learning

Figure 27 Explain to students that the moss shown here was discovered by scientists in an extreme environment on Earth and had survived thousands of years in a dormant state. Also tell them other life forms have been found on Earth living in environments that are usually not conducive to the survival of life. **L2 ELL**

Differentiated Instruction

English-Language Learners Help your English-language learners with their Creature Feature activity. Provide illustrations of life-forms that could possibly exist beyond Earth. For example, some scientists have proposed large life-forms filled with gas that could possibly live in the atmospheres of the jovian planets. The life-form they choose could be one-celled organisms.

2 Teach

Text Question Answer

It is possible.

Discussion

Life in Extreme Environments Remind students that even though NASA is looking for life as we know it (similar to life on Earth) on other worlds, there are many environments on Earth where scientists have found life where it was least expected. Where do life-forms that exist in the darkest parts of Earth's oceans, get the energy needed for life processes? **Possible answer:** thermal and chemical energy **L2**

Activity

Creature Feature Have students choose one of the other planets or moons in our solar system. Ask them to research the conditions on the surface or in the atmosphere of the place they selected. Have them write a one-page description in their Science Journals that explains how a life-form might have developed and survived on their chosen world. Students will need to answer the following questions: How and what does the creature breathe, eat, and drink? How does the creature reproduce? How is the creature protected from the environment? Does it move? If so, how does it move? Have them draw an illustration of the life-form **L2 IS Linguistic**

Reading Check

Answer life beyond Earth, on other worlds

Quick Demo

Ocean Under Ice

Materials crushed ice, clear-plastic container, water

Estimated Time 10 minutes

Procedure Place crushed ice into the plastic container until it covers the bottom of the pan and is about 2 cm thick. Pour cold water into the pan until all of the ice is floating. Place a thermometer into the water and explain that an icy crust completely covering the water would help to maintain some warmth in the water. Explain that the ice covering the Arctic Ocean is similar to the ice that is believed to cover the oceans on Europa.

L2 ELL Visual-Spatial

Reading Strategy

Make Connections As students read the section about Mars and the caption for **Figure 28**, ask them what the words *splish*, *splash*, and *splosh* bring to mind. Scientists speculate that "splosh" craters on Mars might have been made when a space object struck a water-soaked area. Remind students to make connections with the text to help them remember information. **L2 ELL**

Figure 28 This crater on Mars is called a splosh crater. It is hypothesized that a splosh crater forms from the impact of an object on a water-soaked surface.

Mars During most of Earth's history, one-celled organisms were the major form of life on Earth. Could such life-forms be present on Mars today or could they have existed on Mars in the past when the planet was wetter? Evidence from space probes has shown that Mars probably had large amounts of water on its surface, as shown in **Figure 28**. If life existed and left evidence, future astronauts will find it. Such a discovery would be almost as exciting as finding living life-forms.

Actually, searches for life on Mars already have been done. *Viking* landers on Mars performed some tests designed to detect life. The first tests showed positive results, but additional study showed that these results could be explained just as well by chemical

reactions that did not require life. Ultimately, the *Viking* experiments found no evidence of life. However, the tests used only would detect life similar to that which exists on Earth. What if life on Mars is totally different from life on Earth?

Europa Data from the *Galileo* probe of Jupiter and its moons indicate that three Galilean moons have ice-covered oceans. The oceans under the ice of Ganymede and Callisto might be partially frozen. However, data related to surface cracking, as shown in **Figure 29**, tidal bulges, and movement of the surface over some lubricating substance below, support the idea of a liquid ocean about 25 km deep in Europa. Europa's ocean could hold more than twice the amount of water that Earth's oceans hold.

Some scientists speculate there is a chance that Europa's ocean could harbor life. One reason is that it might be deep and long-lasting, possibly even liquid water that is warmed by Jupiter's gravitational pull on Europa.

On Earth, we find life everywhere there is water. If life can

exist in extremely hot liquid flowing from volcanic vents on Earth's ocean floor, could it not exist in a similar environment if it exists on Europa? In fact, ocean currents have been detected on Europa. Today, some scientists consider Europa to be the most promising location to look for extraterrestrial life.

Figure 29 Surface cracking on Europa may indicate that a liquid ocean lies beneath.

Teacher FYI

Europa Europa's surface does not have many craters. This indicates a geologically active surface. One explanation is the presence of a liquid-water ocean under the crust. Data from the *Galileo* spacecraft indicate that cracks form on Europa's surface because of the tidal influence of Jupiter on the ocean.

Visual Learning

Figure 29 This photograph mosaic of Europa, Jupiter's fourth largest moon, shows some double ridges on the moon's surface. These double ridges are thought to be frozen remnants of water eruptions onto the surface that indicate the presence of liquid oceans under the frozen crust. **L2**

Titan Saturn's moon, Titan, shown in **Figure 30**, is larger than Mercury and has an atmosphere composed mostly of nitrogen, with some argon and methane. Certain features on Titan's surface indicate this moon has a long-term, interesting geologic history. Some darker areas contain relatively pure water-ice, while other, brighter areas are composed of hydrocarbons, organic compounds containing hydrogen and carbon. Recall that life on Earth is carbon-based. A bright cloud of the hydrocarbon methane is visible near the south pole. Large particles in this area indicate that a dynamically active atmosphere exists there.

The presence of hydrocarbons on the surface of Titan interests exobiologists, scientists who search for evidence of life on other worlds. Also, the apparent absence of large impact craters indicates that Titan has experienced internal geologic activity. This activity could provide the energy needed for organic molecules to develop into the building blocks of life.

A more detailed study of Titan is programmed for the *Huygens* probe. Data obtained from the *Huygens* probe might help solve the mystery of whether life exists or may have existed on Titan.

Figure 30 This image of Titan taken by *Cassini* shows two thin layers of hazy atmosphere that are thought to contain nitrogen and methane.

Reading Check What fact about Titan particularly interests exobiologists?

section 4 review

Summary

Life As We Know It

- Life as we know it is carbon-based and needs liquid water to survive.

Exotic Life On Earth

- Life exists in extreme environments on Earth.
- Life can remain dormant for long periods of time and still survive.

Mars

- Viking's* tests for life on Mars were inconclusive.

Europa

- There is strong evidence for a warm, liquid ocean on Europa.
- Europa is considered the most promising location to look for extraterrestrial life.

Titan

- Organic compounds exist on Titan.

Self Check

- Define** extraterrestrial life.
- Describe** how finding life in extreme environments on Earth supports the idea that life may exist elsewhere.
- Explain** how hot fluids from volcanic vents on Earth's ocean floor support energy for life.
- Discuss** other locations in the solar system where life may once have existed.
- Think Critically** Explain why scientists consider Europa to be a good place to search for extraterrestrial life.

Applying Math

- Use Numbers** Atmospheric pressure at the surface of Venus is 92 times Earth's at sea level. If atmospheric pressure on Earth at sea level is 101.3 kPa, find the atmospheric pressure on the surface of Venus in kPa.
- Use Percentages** The average composition of Mars's atmosphere is 95% CO₂, 3% N, and 2% Ar. Approximately what fraction of Mars's atmosphere is nitrogen?

More Section Review fl.gpscience.com

SECTION 4 Life in the Solar System 241

section 4 review

- life that developed on other worlds
- If life can withstand, and even thrive, in extreme environments on Earth, then life could exist in the extreme environments found on other planets.
- Organisms use thermal and chemical energy instead of sunlight to produce food that supplies the energy for life.
- Mars was once a wetter planet and could have supported life. Europa may have an ocean under its ice that could or may have supported life.
- Evidence suggests that ocean currents, perhaps caused by volcanoes, are present under Europa's icy crust. This could supply energy for life processes.
- 9,320 kPa
- 3/100

MA.A.1.4.4

Reading Check

Answer the presence of hydrocarbons and absence of large impact craters, which indicate internal geological activity

Post Reading

Reflection Ask students to imagine that they are scientists who must design the next space probe and decide where it should be sent. Have them write a brief paragraph that includes the name of the space probe, why they named it as they did, the destination, and purpose of the probe. How will this space probe benefit the people on Earth? [L2]

3 Assess

DAILY INTERVENTION

Check for Understanding

Linguistic Have students write a poem or song about the likelihood that life will be found on another world in our solar system. Possible answer: Hey, hey, Mars is red. Could it be we've found a bed? For life to use when tired. Life not of Earth, I've said. [L2]

Reteach

Needs of Life Ask students to consider what primitive life on Earth needs to develop. Possible answer: water and warmth Then ask them where conditions like these may exist other than on Earth. Possible answer: Europa [L2]

Assessment

Oral Why do scientists want to find out if Mars had liquid water on its surface sometime in the past? Possible answer: If Mars had oceans or large seas when it had a warmer environment, life may have begun. Fossils might provide evidence of this possible early life. [L2]

Real-World Problem

Purpose Identify evidence that might indicate that life exists in soil from another world.

Process Skills form a hypothesis, design an experiment, separate and control variables, interpret data, observe, infer, compare and contrast, recognize cause and effect, communicate

Time Required 30 minutes to plan the experiment and 40 minutes to conduct the experiment, observe results, and draw conclusions

Materials Provide three containers of sand/soil mixture; one containing finely crushed antacid tablets, one containing dry yeast (about 1/2 tsp per 3 T), and one with nothing added.

Alternate Materials baking soda (however, the reaction is not as great as it is for antacid tablets)

Safety Precautions

- Students should wear protective clothing and eye protection in case of spills.
- Caution students to wash hands thoroughly after the experiment

Form a Hypothesis

- The sample of soil or sand containing life will release gas.
- The sample of soil or sand containing life will release gas and produce heat.
- The sample of soil or sand containing life will release gas, produce heat, and release odors.

Testing Unknown Soil Samples for Life

Real-World Problem

What is life? You know that life needs water, air, and food to survive. The type of food depends on the life form. You eat certain foods to provide you with the energy to live. Other forms of life need different foods for energy. You know that many plants make their own food using photosynthesis, and you have learned about life-forms on Earth that obtain their energy from chemical reactions. How might you find out if life is present in an unknown sample? Perhaps you might look for evidence that an organism was taking in one gas and expelling others. Perhaps you might look for energy being produced. How could you determine if an unknown sample of sand or soil contained life?

Form a Hypothesis

Form a hypothesis about what evidence might indicate that a sand or soil sample contained life. Have your teacher approve your hypothesis before you begin your experiment.

Test Your Hypothesis

Make a Plan

1. As a group, agree upon the hypothesis and decide how to test it. Identify which results will confirm your hypothesis.
2. List the steps you will need to test your hypothesis. Be sure to include a control run. Describe exactly what you will do in each step.

Goals

- **Identify** several things that you might see if life existed in an unknown sand or soil sample.
- **Demonstrate** processes you could use to search for life in the unknown sample.
- **Illustrate** evidence of life that you observe in each of your samples.
- **Compare and contrast** observations that may or may not indicate that life exists in your samples.

Possible Materials

clear plastic cups (3)
sand or soil
warm tap water
magnifying glass
thermometer

Safety Precautions

Data Table

Comparison of Soil or Sand Samples	
Sample number	Observations
Cup 1	No observed reactions.
Cup 2	Gas escapes
Cup 3	Gas escapes; heat and odor are produced.

Alternative Inquiry Lab

Hypothesize and Research Students imagine a life form and describe conditions that will support it. Remind them of conditions such as temperature, pressure, gravity, chemical composition, and energy sources. Students then will research whether a planet provides the necessary conditions to support their hypothesize life form.

Using Scientific Methods

- List** the materials you will need to perform the experiment. Determine who will prepare your unknown samples from your materials.
- Prepare** an illustration in your Science Journal where you will record your observations.
- Read** the entire experiment to make sure all steps will be performed in a logical order.
- Identify** all constants, variables, and controls of the experiment. Keep in mind that the person who prepares your unknowns must follow your instructions carefully and not divulge which sample(s) contain life.

Follow Your Plan

- Make sure your teacher approves your plan and oversees the preparation of your unknown samples before you start.
- Carry out your experiment as planned.
- While doing the experiment, record your observations in your illustration in your Science Journal.

Analyze Your Data

- Illustrate** your visual observations of unknown sand or soil samples.
- Label your drawings with other observations that you make, such as production of heat or change in odor.

Conclude and Apply

- Examine** Do the illustrations show the observations you expected to make? Describe any unexpected observations noted.
- Determine** Do any of your observations indicate that life exists in any of your unknown samples? Describe any inconclusive observations.
- Draw Conclusions** Did your results support your hypothesis? Explain why or why not.

Communicating Your Data

Compare your data with those of other students. Discuss how your experiments may have differed, and how this could have changed the observations.

LAB 243

Assessment

Portfolio Have groups of students prepare a mission description of an experiment to search for evidence of life on Mars that could be done by a robot rover. **Possible answer:** A robotic arm scoops up soil from the Martian surface and retracts it into a container where various solutions are introduced into the sample. Use **Performance Assessment in the Science Classroom**, p. 169. **P** **L2**

Communicating Your Data

Have students use graphics software to prepare a poster explaining their experiment and the results. Posters should contain the illustrations and data table produced during the experiment, as well as any conclusions they have reached.

Test Your Hypothesis

Possible Procedures One student from each group obtains warm water from the tap and adds just enough to completely cover the material in each cup.

Teaching Strategy Encourage students to measure equal amounts of soil or sand mixtures and to add the same amount of water into each cup.

Tie to Prior Knowledge Help students recall that life processes can produce gas, heat, and odors.

Troubleshooting Before beginning the lab, provide three containers with properly mixed material.

Expected Outcome Students should note gas being released from two of the mixtures. Increased heat and odors may be present.

Analyze Your Data

- Illustrations should show gas being emitted from two of the samples.
- Illustrations might show an increase in temperature and odors may be present.

Error Analysis Ask students to compare their results with others and discuss possible differences in conclusions drawn.

Conclude and Apply

- Gas is released from two mixtures. Answers will vary.
- Released gas and production of heat indicate life may be present. Released gas alone is inconclusive.
- Answers will depend on student hypotheses.

LAB 243

Content Background

Many planets are easily visible with the unaided eye. Venus appears as the brightest object in the night or morning sky, with the exception of the Moon. Jupiter is also bright, and resembles a cream-colored star. Mars looks like a bright, orange-yellow star, while Saturn appears as a gold-colored star. Mercury is the most difficult planet to spot, because its location usually keeps it within the Sun's glare. Often the weather page of a newspaper says which planets are visible. You can also check astronomy guidebooks and internet sites.

L2 ELL

Discussion

What do you think? Some people believe that planetary alignments can cause natural disasters, such as floods, earthquakes, and hurricanes. Do you think these phenomena are related? Possible answer: *Scientists know that all planets, even those closest to Earth, are too far away to have any noticeable gravitational effect on Earth processes, the oceans, or the atmosphere.* L2

Teaching Strategies

- Make sure students use the correct units to express the answer to question 2.
- Review with students how to best establish ratios to answer question 3.
- Remind students to measure angles in a counterclockwise direction.

Night Sky Wonders

Did You Know...

... **Five of the nine planets can be seen from Earth without the aid of a telescope or binoculars.** Mars, Venus, Mercury, Jupiter, and Saturn can be seen at various times throughout the year in the night or early morning sky. Mercury is visible for only a few days, but the other planets are often clearly visible, such as Mars and Venus shown here.

... **All five planets were visible as a group in the evening sky in the spring of 2004.**

All five planets were briefly positioned on the same side of the Sun at the same time. This stunning sight will not be seen in the evening skies again until 2036. Because they orbit the Sun at different rates, it is rare for all five visible planets to be as close together in the sky as they were in 2004.

Applying Math

1. How old will you be when the next planetary alignment like the one that was visible in 2004 can be seen from Earth again?
2. The reflected light we see when observing planets travels through space at 300,000 km/s. If Jupiter is 588.5 million km from Earth at its closest approach, what is the minimum amount of time required for light to reach Earth from Jupiter?
3. Using the heliocentric longitude diagram you made in the Applying Math feature, plot the positions of the planets using the following longitudes: Mercury 96°, Venus 135°, Earth 184°, Mars 94°, Jupiter 165°, and Saturn 103°.

244 CHAPTER 8 The Solar System

Applying Math

Answers

1. Answers will vary. Have students subtract the current year from 2036, then add the remainder to their age.
2. 1,962 s or 32.7 minutes
3. Check diagrams

MA.B.2.4.1

Activity

Study the sky. Have students research which planets are currently visible in your area. Ask students to locate these planets in the nighttime or early morning sky. Students should record their observations for at least one week, describing any trends they notice. L3

Reviewing Main Ideas

Section 1 Planet Motion

1. In the geocentric model of the solar system, Earth is in the center. In the heliocentric model, the Sun is in the center.
2. The position of a planet in orbit around the Sun can be shown by heliocentric longitude.
3. Inner planets have orbits closer to the Sun than the asteroid belt; outer planets have orbits beyond the asteroid belt.
4. A large nebula, like the one shown below, fragmented into smaller ones, one of which later condensed and flattened to form the solar system.

Section 3 The Outer Planets

1. Jupiter is the largest planet in the solar system and has the most moons. Four of these moons were first seen by Galileo.
2. Saturn has the most developed ring system of all outer planets.
3. The green-blue color of Uranus and the blue color of Neptune are caused by methane in their atmospheres.
4. Pluto is the smallest planet, and unlike other outer planets, it has a thin atmosphere and an icy rock surface.

Section 4 Life in the Solar System

1. Life exists in extreme environments on Earth and may be able to survive in extreme environments on other planets.
2. Europa is considered the most promising location in the solar system to look for extraterrestrial life.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review details about each of the planets.

Assessment

FOLDABLES Have students use their Foldables to review the content of the chapter.

Using Vocabulary

- Neptune has slightly more methane in its atmosphere. Both are jovian (gas giant) planets.
- Extraterrestrial life might be found on extrasolar planets. Both are beyond Earth.
- Pluto is a planet; Sedna is a planetoid. Both are icy worlds far from the Sun.
- Venus is much hotter and has a denser atmosphere. Both are about the same size.
- Mercury is an inner planet; Jupiter is an outer planet. Both are planets.
- Asteroids are located between Mars and Jupiter; Sedna lies far beyond Pluto. Both are small rocky bodies.
- Earth is at the center of the geocentric model; the Sun lies at the center of the heliocentric model. Both are models of the solar system.
- An astronomical unit is a measure of distance; Earth is a planet. Earth is one astronomical unit from the Sun.
- Jupiter is larger and denser than Saturn; Both are jovian (gas giant) planets.
- Earth has oceans; Mars may once have had water on its surface. Both are terrestrial and inner planets.

Checking Concepts

Using Vocabulary

asteroid p. 236	Mars p. 225
✱ astronomical unit p. 220	Mercury p. 223
comet p. 236	meteoroid p. 236
Earth p. 225	Neptune p. 2
extrasolar planet p. 222	Pluto p. 236
extraterrestrial life p. 239	Saturn p. 234
geocentric model p. 218	Sedna p. 237
heliocentric model p. 219	Uranus p. 231
Jupiter p. 231	Venus p. 224

✱ I CAT Vocabulary

Use what you know about the vocabulary terms to explain the differences in the following sets of words. Then explain how they are related.

- Uranus—Neptune
- extrasolar planet—extraterrestrial life
- Pluto—Sedna
- Venus—Earth
- Mercury—Jupiter
- asteroid—Sedna
- geocentric model—heliocentric model
- astronomical unit—Earth
- Jupiter—Saturn
- Earth—Mars

Checking Concepts

Choose the word or phrase that best answers the question.

- Who proposed the heliocentric model of the solar system?
A) Copernicus C) Kepler
B) Galileo D) Ptolemy
- Which planet has the most complex ring system?
A) Jupiter C) Saturn
B) Neptune D) Uranus

- Which planet is the red planet?
A) Jupiter C) Neptune
B) Mars D) Venus
- Which chemical or gas produces a green-blue to blue color in Uranus and Neptune?
A) carbon dioxide C) oxygen
B) methane D) sulfur dioxide
- Which planet has the highest surface temperature?
A) Earth C) Mercury
B) Mars D) Venus
- Which fact is true of superior planets?
A) Earth-sized
B) Jupiter-sized
C) lie beyond Earth's orbit
D) lie beyond the asteroid belt
- Which Galilean satellite has active volcanoes?
A) Callisto C) Ganymede
B) Europa D) Io

Use the illustration below to answer question 18.

- Which planet is shown?
A) Jupiter
B) Mars
C) Saturn
D) Venus

- Which part of a comet is on the opposite side of a comet from the Sun?
A) coma C) nucleus
B) head D) tail
- What is a reason Europa might be a good place to look for extraterrestrial life?
A) liquid methane
B) presence of organic molecules
C) rust-colored rocks
D) water ocean and tidal energy

Interpreting Graphics

21. **Make a table** summarizing the gases contained in the atmospheres of the nine planets.
22. **Make a model** of how you think the geocentric model of the solar system was organized.

Use the data in the table below to answer questions 23–25.

Planet Orbits

Planet	Distance to the Sun (AU)
Mercury	0.39
Venus	0.72
Earth	1.00
Mars	1.52
Jupiter	5.20
Saturn	9.54
Uranus	19.19
Neptune	30.07
Pluto	39.48

23. Which planet is a little over nine times farther from the Sun than Earth?
24. How far is the orbit of Mars from that of Jupiter in AU's?
25. How much closer to Earth is Venus than is Mars?

Thinking Critically

26. **Explain** why Venus has a higher surface temperature than Mercury even though Mercury is closer to the Sun.
27. **Form a hypothesis** about where the oxygen that combined with the iron in rocks on Mars came from.

28. **Classify** a newly discovered planet, by using three classification systems, with the following characteristics: 10,000 km in diameter, rocky surface, an orbit beyond Pluto's.
29. **Explain** why Mars, Europa, and Titan are of interest to scientists searching for extraterrestrial life.
30. **Explain** several reasons why Earth is the only planet in the solar system that appears capable of supporting life as we know it.

Applying Math

31. **Use Angles** How far around in its orbit would a planet be if its heliocentric longitude was 90 degrees?
32. **Calculate** Jupiter's distance from the Sun is 5.2 AU. Use the equation (planet's distance in AU)³ = (planet's period in years)² to calculate Jupiter's period of revolution.

Use the diagram below to answer No. 33.

33. **Use Angles** If the Heliocentric Longitude (H. L.) of planet A is 33 degrees, what is the approximate H.L. of planet B?
34. **Using Equations** Use the equation $V = \frac{4}{3} (\pi r^3)$ to determine the volume of Venus, which has a radius of 6052 km.

Interpreting Graphics

21.

Gases in the Planet Atmospheres

Mercury	none
Venus	mostly carbon dioxide
Earth	nitrogen, oxygen, other
Mars	mostly carbon dioxide
Jupiter	helium, water, methane, hydrogen, ammonia
Saturn	water, helium methane, ammonia, hydrogen
Uranus	hydrogen, helium, methane
Neptune	hydrogen, helium, methane
Pluto	very thin

22. Earth, then Moon, Mercury, Venus, Sun, Mars, Jupiter, and Saturn.
23. Saturn
24. 3.68 AU
25. 0.24 AU closer

Thinking Critically

26. Venus has a thick cloud cover that causes a greenhouse effect.
27. Oxygen was once in the Martian atmosphere or in water.
28. terrestrial; outer; superior
29. Mars and Europa may have, Titan might have seas of methane.
30. Water exists as a solid, a liquid, and a gas on Earth. Ozone protects life from intense solar radiation.

Applying Math

Math Standards

National: 1, 4, 9

Florida: MA.A.1.4.4, MA.B.1.4.1, MA.B.1.4.2

31. $\frac{1}{4}$ of the way
32. 11.9
33. 213^{cm}
34. 928 billion km³

Multiple Choice

1. B
2. B
3. A
4. C
5. B
6. B

Record your answers on the answer sheet provided by your teacher or on a sheet of paper. The assessed Florida Benchmark appears above the question.

Multiple Choice

SCE.1.4.2, SCE.1.4.3

Use the illustration below to answer question 1.

1. As seen from above their north poles, in which direction do planets move around the Sun?
 - A. clockwise
 - B. counterclockwise
 - C. geocentric
 - D. heliocentric
2. Which model of the solar system places the Sun in the center?
 - A. geocentric
 - B. heliocentric
 - C. inferior
 - D. superior

Test-Taking Tip

Practice Remember that test-taking skills can improve with practice. If possible, take at least one practice test and familiarize yourself with the test format and instructions.

3. What did Galileo observe about Venus?
 - A. It goes through phases.
 - B. It has two moons.
 - C. It is covered by clouds.
 - D. Its surface temperature is over 450°C.

4. Who determined that planets orbit the Sun in elliptical orbits?
 - A. Brahe
 - B. Copernicus
 - C. Kepler
 - D. Ptolemy

Use the photo below to answer question 5.

5. Which moon of Jupiter, pictured here, is most likely to have liquid water under its ice crust?
 - A. Callisto
 - B. Europa
 - C. Ganymede
 - D. Io

6. Which is composed of dust and rock particles mixed in with frozen water, methane, and ammonia?

A. asteroid
B. comet
C. meteoroid
D. meteorite

Gridded Response

7. Saturn travels 360° around the Sun for 29.5 years to complete one orbit. How many years will it take Saturn to complete 195° of its orbit?
8. If the orbital radius of Jupiter is 5.2 AU, what fraction of that distance is Earth's orbital radius?

Short Response

Use the illustration below to answer question 9.

9. How does retrograde motion of planets, such as Mars shown in the illustration, provide support for the heliocentric model of the solar system?

10. What causes Mars to have a reddish-orange color?
11. Why was the *Galileo* spacecraft given this name?
12. What is generally true of all jovian planets?
13. Compare and contrast Venus to Earth. Why does it appear unlikely that Venus is capable of supporting life as we know it?
14. Compare and contrast Jupiter to Earth. Why does it appear unlikely that Jupiter is capable of supporting life as we know it?
15. Why would the discovery of oceans existing under the surface ice of Europa be so interesting to astronomers?

Extended Response

Use the photo below to answer question 16.

16. **PART A** What, shown in the photograph, did the NASA spacecraft, *Opportunity*, discover on Mars?
- PART B** Why is this discovery so important?

13. Both are rocky inner planets. Liquid water, which is needed for life, cannot exist on Venus because its surface temperature is too great.
14. Jupiter's gravity, chemical composition, temperature, pressure, storms, and lack of a well-defined surface are not conditions that support life.
15. If liquid-water existed on Europa under its icy crust, temperatures might have been high enough to that life could exist, especially if volcanic vents provided the chemical energy needed for life processes.

Extended Response

16. **Part A:** The *Opportunity* spacecraft discovered blueberries, concretion deposits of hematite.

Part B: Deposits of hematite of this nature form in the presence of standing water on Earth. This indicates that Mars was once wetter than it is today. If Mars were once wetter than today, perhaps life could have existed on ancient Mars.

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubrics on p. 9T.

Gridded Response

7. about 16 years
8. about one-fifth

Short Response

9. As Earth moves in orbit around the Sun, it overtakes and then passes the position of Mars, or other superior planets. Mars, or other superior

planets, seem to move backward compared to their earlier movement.

10. Mars's surface is composed of weathered rocks containing iron oxide.
11. Galileo recognized that four objects were orbiting Jupiter, which were named the Galilean moons of

Jupiter.

12. Jovian planets are gaseous giant planets, similar in size and characteristics to Jupiter. They have diameters greater than 10,000 km, the visible surface being thick cloud layers that gradually change to denser layers deep inside the planets.

Unit Contents

Chapter 9
Heat and States of Matter

- 1 Temperature and Thermal Energy
- 2 States of Matter
- 3 Transferring Thermal Energy
- 4 Using Thermal Energy

Chapter 10 Waves

- 1 The Nature of Waves
- 2 Wave Properties
- 3 The Behavior of Waves

Chapter 11 Sound and Light

- 1 Sound
- 2 Reflection and Refraction of Light
- 3 Mirrors, Lenses, and the Eye
- 4 Light and Color

Chapter 12
Earth's Internal Processes

- 1 Evolution of Earth's Crust
- 2 Earthquakes
- 3 Earth's Interior
- 4 Volcanoes

**Created Gemstones: The Real Thing?**

is a real-life scenario. Given the task of purchasing a natural or synthetic gemstone, students research to discover how natural gems form, what their chemical, physical, and optical properties are, as well as how their flaws are corrected and their colors enhanced. Students will compare the laboratory processes used to create gems, their prices, and properties, and decide if they are the same as their natural counterparts. Students will choose between a simulated or a naturally created gemstone as a gift for someone. They must be able to give their reasons and justify the amount of money they will spend.

How Are Glassblowing & X Rays Connected?

PROJECT

CRISS

Study Skills

Vocabulary Students expand their knowledge to extend beyond a strict definition. Students use a definition map in this unit to better understand essential vocabulary. The center box of the map might contain the word

"wave." One arm would answer the question, "What is it?" Another arm would answer, "What are the types of waves?" Cooperative teams would continue the map until they have reached a full definition of the word.

unit projects

History Ask students to “adopt” a specific volcano, earthquake fault, mountain range, or geological region of the world and study its history. Patterns of activity, intensity of movement, and how these changes have affected the surrounding environment, as well as plant and animal populations should be considered. Students can prepare a journal, time line, or technology presentation to display the change in their land form and its populations over time.

Technology Working in small groups, have students research medical procedures that use waves, sound, or light to form diagnostic images. Procedures may include MRI, CAT scan, X rays, thermal imaging, or ultrasound. Have students create an advertisement or news broadcast about their particular procedure to demonstrate how their image is formed, its benefits and limitations, and any related health risks.

Model Ask students to design their own creative musical instrument. Instruments should demonstrate a full scale and be able to be tuned to the proper pitch. Applying appropriate physics terms, students should be able to explain how their instrument produces a variety of sounds. Using a simple musical score (“Twinkle, Twinkle Little Star,” for example) have students participate in an all-class orchestra with their physics musical instruments.

Additional Resources Visit unit projects at fl.gpescience.com for more information, resources, and assessment rubrics.

Glassblowing (far left) is an art in which air is blown through a tube to shape melted glass. In the mid-1800s, a glassblower created a glass tube, sealed metal electrodes into the ends, and removed most of the air from inside. When electricity was passed through the tube, it glowed. The glow aroused the curiosity of scientists, who began experimenting with similar tubes. In order to observe the glow more closely, one physicist surrounded a tube with black cardboard and darkened the laboratory. When the electric current was turned on, the tube glowed—but so did an object across the room! Apparently the tube was emitting some kind of radiation that could pass through cardboard. The mysterious radiation became known as X rays. Scientists eventually learned that X rays are a form of electromagnetic radiation, similar to visible light but with shorter wavelengths and higher energy. Because X rays pass through many substances, they have become important in medicine and science, making it possible to “see” structures inside the bodies of people—and also fish.

unit projects

Visit unit projects at fl.gpescience.com to find project ideas and resources. Projects include:

- **History** Adopt a landform to research and record its geological and environmental changes throughout history.
- **Technology** Research medical procedures that use waves, sound, light, or heat to form diagnostic images.
- **Model** Design and construct your own creative musical instrument. Participate in a class orchestra of homemade instruments.

Created Gemstones: The Real Thing offers an opportunity to evaluate the process and value of manufactured gems.

How Are Glassblowing & X Rays Connected?

- Tell students that X rays can be used on things that are not living. For example, they are helpful in locating cracks and overstressed areas in buildings and other structures.
- Ask students to brainstorm as many examples of energy on the move as they can. In addition to X rays and other types of electromagnetic radiation, such as visible light, lists might include transfer of heat from one place to another or the movement of an object, such as a bouncing ball.

Section Focus

Section Focus Transparency **A Spectacular Reentry**

In 1968, Apollo 8 became the first piloted vehicle to orbit the Moon. Before you see Apollo 8 as it reenters Earth's atmosphere, friction between the atmosphere and the hurdling spacecraft created temperatures of up to 3,000 °C! The craft and the astronauts inside needed special protection in order to survive these inferno-like temperatures.

1. Why is it a concern that the exterior of a spacecraft experiences very high temperatures upon reentry?
2. If a metal pan with a metal handle sits on a lit burner for a long time, what happens to the handle?
3. When it's cold out, why does a jacket keep you stay nice and warm?

L2

Section Focus Transparency **Water Works**

Sculptors use a variety of materials to create their works of art. Those who sculpt marble or wood expect their work to last for many years. Ice sculptors, on the other hand, know that the Sun will soon turn their intricate works into pools of water.

1. What happens to molecules of water as ice melts?
2. Why does snow melt when you hold it in your hand?
3. What happens when water boils?

L2

Section Focus Transparency **Steam Power**

Steam engines convert heat energy into mechanical energy. The engines use heat energy to produce steam that powers the locomotive. During the 1800s, steam engines were used in factories and mills and to propel boats and trains.

1. What are some fuels that the engines might burn to create steam?
2. Describe how liquid water is different from steam (gaseous water).
3. What changes steam energy to mechanical energy in the locomotive?

L2

Section Focus Transparency **One Small Step**

From a farm in Massachusetts, Robert Goddard launched the first liquid-powered rocket in 1926. Using liquid oxygen and gasoline as propellants, the small rocket rose to 41 feet, crashed over, and landed in a cabbage patch. The flight lasted only 2.5 seconds, yet it was the beginning of the rocket age.

1. Which one of the liquids is flammable?
2. When you heat a gas, what will it do?
3. Why do you think gases are cooled to a liquid state for use in rockets?

L2

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Assessment

Assessment Transparency **Thermal Energy**

Directions: A diagram shows the diagram and answer the following questions.

1. Which hypothesis is probably being tested by this experiment?
 - A. Different metals conduct heat at different rates.
 - B. Brass conducts heat better than any other metal.
 - C. Metals are good insulators.
 - D. Different kinds of ways melt at different rates.
2. According to the diagram, which metal conducts heat BEST?
 - F. Aluminum
 - G. Nickel
 - H. Iron
 - J. Copper
3. Most metals will have all of the following properties EXCEPT
 - A. shiny luster
 - B. good conductor of heat
 - C. solid at room temperature
 - D. good insulators

Science Content Background

Temperature and Thermal Energy

Temperature

It is important to differentiate between temperature and thermal energy. A small nail at 100°C has less thermal energy than a large hammer at 90°C .

The common thermometer is a tube filled with colored alcohol or mercury, which expands with increasing thermal energy to give a reading of the temperature. Digital thermometers rely on the increase in electrical resistance with higher temperature to ascertain temperature.

Three temperature scales are commonly used. The Celsius scale is used by most of the world and in most scientific work. The oldest, the Fahrenheit scale, is used in the United States. The Kelvin is the official SI unit for temperature. This scale, used by scientists, is based on absolute zero—the lowest possible temperature. 0 K is a theoretical value not yet observed.

Thermal Energy

Which contains more thermal energy, liquid water at 100°C or steam at 100°C ? Anyone who has been burned by steam knows the correct answer—steam! Thermal energy is the sum of both kinetic and potential energy. The steam, although at the same temperature as the liquid water, has more potential energy. This is the energy it absorbed in the phase change from a liquid to a gas.

Properties of materials can change as they gain or lose thermal energy. For example, most substances expand when they are heated, resistance in wire increases with rises in temperature, the color of some materials is influenced by temperature, and materials can change phase as they gain or lose thermal energy.

Heat

The SI unit of thermal energy is the joule. Calorie is another unit frequently used. One calorie, equal

to 4.184 joules, is the amount of thermal energy needed to raise the temperature of one gram of water 1°C . This amount is so small that food energy is measured in kilocalories. Kilocalories are also called Calories. So, if a food label says the food contains 150 Calories, it really has 150,000 calories, or 627,600 joules, of energy.

Specific Heat

Water has a very high specific heat. If you have 1 g of water and 1 g of aluminum and you add one calorie of thermal energy to each, the water will increase in temperature by about one degree and the aluminum's temperature will increase by about five degrees. The high specific heat of water has important influences on climate. Large bodies of water tend to maintain their temperatures longer than smaller bodies of water, so areas near the ocean often have milder summers and winters.

States of Matter

Matter at 0 K has the lowest possible amount of thermal energy. The freezing point of water on the Celsius scale is 0 degrees; the freezing point of water on the Kelvin scale is 273 K . The average kinetic energy of the particles that make up a substance is directly proportional to the Kelvin temperature.

Matter is made of tiny particles separated by distances with nothing between the particles. The particles are in motion. In gases, the separation of the particles is the greatest because these particles are moving the fastest. The amount of space between the particles varies with temperature, volume, and pressure.

Transferring Thermal Energy

Thermal energy can move from one place to another in three ways: conduction, convection, and radiation.

In any material, atoms and molecules are in constant random motion, continually

colliding with one another. These collisions cause energy to be transferred between particles.

Conduction

Heat transfer by conduction is the most effective way of transferring heat in a solid. Particles vibrate about a fixed position in a solid, and are not free to move from place to place. Collisions between vibrating particles cause thermal energy to be transferred from higher-energy to lower-energy particles. Conduction occurs when thermal energy moves in a material without any net movement of the material itself. Conduction can also occur in liquids and gases, but thermal energy is transferred more slowly than in solids.

Convection

Particles can move more freely in liquids and gases than in solids. As a result, thermal energy is transferred when particles in a material move from regions of higher temperature to regions of lower temperature. Convection occurs when thermal energy is transferred by the movement of matter from place to place. Thermal energy usually is transferred more rapidly by convection than conduction.

Radiation

Thermal energy can be transferred most rapidly by radiation. The vibrations of charged particles in any material cause the material to emit electromagnetic waves. These waves travel at the speed of light from one place to another. Like all waves,

electromagnetic waves transfer energy. The transfer of thermal energy by radiation occurs when electromagnetic waves strike a material, and energy is transferred to the material. This causes particles in the material to move faster, increasing the material's temperature and thermal energy.

Using Thermal Energy Thermodynamics

Thermodynamics is the study of the relationship between thermal energy and work. Scientists in the early nineteenth century began developing thermodynamics as a result of their interest in improving the efficiency of the steam engine.

The work of Count Rumford, James Joule, and others showed that work could be converted into an equivalent amount of thermal energy. According to the first law of thermodynamics, the increase in the thermal energy of a system equals the thermal energy added to the system plus the work done on the system.

According to the second law of thermodynamics, only processes that cause the entropy of the universe to increase can occur. The entropy of a system can be defined as a measure of the amount of energy of the system that cannot be converted into usable energy. The second law of thermodynamics means that the amount of usable energy is always decreasing.

Hot Stuff

This hot, glowing liquid will become solid steel when it cools. The difference between liquid and solid steel is energy—thermal energy. Increasing the thermal energy of solid steel can cause it to melt and change into a fiery liquid.

Science Journal Describe things you do to make yourself feel warmer or cooler.

Theme Connection

Energy Thermal energy is the kinetic and potential energy of the molecules, ions, and atoms that make up matter. The kinetic energy of the particles in a substance plays a major role in determining whether the substance is in the solid, liquid, or gas state. Thermal energy can be transferred by conduction, convection, and radiation, and can be converted into mechanical energy to do work.

About the Photo

Molten Steel Steel is an alloy of iron and carbon. The carbon content of steel ranges up to 2% carbon. Alloys with higher carbon content are classified as cast iron. Steel is widely used to manufacture a wide range of products, from skyscrapers to rail cars. It is used extensively because it is relatively inexpensive to process; the raw materials are available in abundance, and because of its desirable properties.

Start-Up Activities

Expansion of a Gas

Why does mercury in a thermometer rise? Why do sidewalks, streets, and bridges have cracks? Many substances expand when heated and contract when cooled, as you will see during this lab.

1. Blow up a balloon until it is half filled. Use a tape measure to measure the circumference of the balloon.
2. Pour water into a large beaker until it is half full. Place

the beaker on a hot plate and wait for the water to boil.

3. Set the balloon on the mouth of the beaker and observe for 5 min. Be careful not to allow the balloon to touch the hot plate. Again measure the circumference of the balloon.
4. **Think Critically** Write a paragraph in your Science Journal describing the changing size of the balloon's circumference. Infer why the balloon's circumference changed.

FOLDABLESTM Study Organizer

Thermal Energy and States of Matter Make the following Foldable to help you understand thermal energy and states of matter.

- STEP 1** Fold a vertical sheet of paper in half from top to bottom.

- STEP 2** Fold in half from side to side with the fold at the top.

- STEP 3** Unfold the paper once. Cut only the fold of the top flap to make two tabs.

- STEP 4** Turn the paper vertically and label the front tabs as shown.

Find Main Ideas As you read the chapter, write the main ideas you find about thermal energy and states of matter under the appropriate tab.

Science

Preview this chapter's content and activities at

www.pearsoned.com

Purpose Use the Launch Lab to introduce students to the fact that matter changes as temperature changes.

Preparation Before students do this activity, obtain metric tape measures.

Materials balloon, tape measure, large beaker, hot plate, water

Teaching Strategy Help students set up data tables in which to record their measurements.

Think Critically

The circumference of the balloon increased as the temperature of the air in the balloon increased. The balloon's size would decrease if it were cooled.

Assessment

Process Ask the students how the results of this activity would have been different if they had put water in the balloon instead of air. The balloon would not have expanded much when it was heated. Use **Performance Assessment** in the Science Classroom, p. 89.

Tie to Prior Knowledge

Specific Heat Ask students whether they have ever noticed that some materials heat up faster than others. Tell students that the amount of thermal energy it takes to make a substance warm up is called its specific heat, one of the things they will learn about in this section.

Activate Background Knowledge

Ask students what they know about the new vocabulary words. Point out that each word is connected to a complex concept. Have students find passages that contain the words and explain the words to a partner, using context clues within the text. Have the class share their word conversations.

Reading Guide

FCAT Vocabulary

What You'll Learn

- Define temperature.
- Explain how thermal energy and temperature are related.
- Calculate the change in thermal energy of an object due to a temperature change.

Why It's Important

Cars, buses, trucks, and airplanes could not operate without thermal energy.

Review Vocabulary

kinetic energy: energy an object has due to its motion

New Vocabulary

- kinetic theory
- Kelvin**
- temperature
- thermal energy
- heat
- specific heat

Kinetic Theory of Matter

All around you objects are warming and cooling. What is temperature and what causes the temperature of an object to change? The temperature of an object is related to the motion of the particles in that object. The motion of the particles in matter is described by the **kinetic theory** of matter.

According to the kinetic theory, matter is composed of particles that are atoms, molecules, or ions that always are in random motion. This means that the particles in matter are moving at different speeds in all directions. Because these particles are in motion, they have kinetic energy. These particles also can collide and kinetic energy can be transferred from one particle to another particle.

Reading Check

How do the particles in matter move?

Figure 1 When particles collide, kinetic energy can be transferred from one particle to another and the direction of particle motion changes.

Mathematics Skill Activities, pp. 19–20

Temperature

The particles in matter are moving at various speeds and have a range of kinetic energies. The **temperature** of a substance is a measure of the average kinetic energy of its particles. As the average speed of the particles in random motion increases, the temperature of the substance increases. For example, the particles in hot tea move faster on average than those in iced tea.

Temperature Scales The SI unit for temperature is the **Kelvin** (K). More commonly used temperature scales are the Celsius scale and the Fahrenheit scale. Subtracting 273 from a temperature in Kelvin converts the temperature to degrees Celsius. Temperatures measured on the Celsius and Fahrenheit scales can be converted into one another using these equations:

Celsius-Fahrenheit Conversion Equations

To convert temperature in °F to °C: $^{\circ}\text{C} = \frac{5}{9}(^{\circ}\text{F} - 32)$

To convert temperature in °C to °F: $^{\circ}\text{F} = \frac{9}{5}^{\circ}\text{C} + 32$

Applying Math Solve a Simple Equation

CONVERTING TO CELSIUS What is a temperature of 86°F on the Celsius scale?

IDENTIFY known values and the unknown value

Identify the known values:

the temperature is 86°F $\xrightarrow{\text{means}}$ °F = 86

Identify the unknown values:

What is this temperature on the Celsius scale? $\xrightarrow{\text{means}}$ °C = ?

SOLVE the problem

Substitute the temperature 86°F into the equation that converts °F to °C:

$$^{\circ}\text{C} = \frac{5}{9}(^{\circ}\text{F} - 32) = \frac{5}{9}(86 - 32) = 30^{\circ}\text{C}$$

CHECK your answer

Does your answer seem reasonable? Multiply your answer by $\frac{9}{5}$ and add 32. The result should be the given Fahrenheit temperature.

Practice Problems

1. What is -40°F in degrees Celsius?
2. What is a temperature of 22°C in degrees Fahrenheit?

Reading Check

Answer in all directions with various speeds

Activity

Temperature Conversions Ask students how they might test to see if the temperature conversion equations are correct. Lead them to suggest that they can check the equations by inserting the correct numbers for the boiling and/or freezing points of water and making sure that the two sides are equal.

Applying Math

Math Standards

National: 1, 4, 9

Florida: MA.B.2.4.1

Answers to Practice Problems

1. $^{\circ}\text{C} = (5/9)(-40 - 32) = -40^{\circ}\text{C}$
2. $^{\circ}\text{F} = (9/5)(22) + 32 = 72^{\circ}\text{F}$

Teacher FYI

Shivering One way the human body maintains its internal temperature is through the rapid movement known as shivering.

Fun Fact

Water is a unique substance. Unlike most materials that expand when heated, water at temperatures of 1, 2, or 3°C contracts when heated. Water is most dense at 4°C. This property allows ice to float in your glass of water and keeps ponds from freezing from the bottom up.

Reading Check

Answer **potential energy**

Caption Answer

Figure 2 Increasing the temperature increases the kinetic energy of the particles.

IDENTIFYING

Misconceptions

Maintaining Thermal Energy

During cold weather, people often close doors and windows “to keep the cold out.” Since cold is the absence of thermal energy, they are actually attempting to keep the thermal energy inside, not keep the cold out.

Reading Strategy

Note Taking Have students read Thermal Energy and ask them to write a formula for thermal energy as a way of summarizing and note taking. **Thermal Energy = Kinetic Energy + Potential Energy**

Scienceonline

Topic: Weather Satellites

Visit fl.gpscience.com for Web links to information about how weather satellites use thermal energy to acquire weather data.

Activity Draw a diagram showing how a satellite uses thermal energy to produce images.

Thermal Energy

According to the kinetic theory, atoms and molecules that make up matter are in constant motion. However, not only do these particles have kinetic energy due to their motion, they also have potential energy. This is because atoms and molecules exert attractive electric forces on each other. Recall that Earth exerts an attractive gravitational force on a ball. When the ball is above the ground, the ball and Earth are separated, and the ball has potential energy. In the same way, particles that exert attractive forces on each other have potential energy that increases as they get farther apart. The sum of the kinetic and potential energies of all the particles in an object is the **thermal energy** of the object. **Figure 2** shows how thermal energy depends on the kinetic and potential energies of the particles in a material.

Reading Check What type of energy results from the attractive forces between particles?

Thermal Energy of a Moving Object You’ve learned that the faster an object moves, the greater its kinetic energy. A ball rolling across the floor has greater kinetic energy than if it were sitting still. Does this mean that the rolling ball also has greater thermal energy? At first, the answer might seem to be yes, but in fact, the thermal energy is the same for both of the balls, if they are at the same temperature. Thermal energy is the sum of the kinetic energy and potential energy of the particles that make up the ball, not of the ball itself. The increase in the ball’s speed doesn’t affect the random motion of its particles, so it doesn’t affect its thermal energy.

Figure 2 The thermal energy of a substance is the sum of the kinetic and potential energies of its molecules.

Infer why increasing the temperature of an object increases its thermal energy.

Active Reading

Quickwrites This strategy, sometimes called freewrite, lets students use spontaneous writing to discover what they already know. Have students write a list of ideas about thermal energy and then share these ideas with the class. Next, have students write about these ideas freely without worrying about punctuation, spelling, or grammar. Have students use a quickwrite to share ideas about thermal energy and heat. **L2** **LS** **Linguistic**

Heat

Can you tell if someone has been sitting in your chair? Perhaps you’ve noticed that your chair felt warm, and maybe you concluded that someone was sitting in it recently. The chair felt warmer because thermal energy from the person’s body flowed to the chair, increasing the chair’s temperature.

Heat is thermal energy that flows from something at a higher temperature to something at a lower temperature. Heat is a form of energy, so it is measured in joules. Thermal energy always flows from a warmer to a cooler material. How did the ice cream in **Figure 3** become cold? Thermal energy flowed from the warmer liquid ingredients to the cooler ice-and-salt mixture. The liquid ingredients lost enough thermal energy to become cold enough to freeze. Meanwhile, the ice-and-salt solution absorbed thermal energy, causing some of the ice to melt.

Reading Check How are heat and thermal energy related?

Specific Heat

If you are at the beach in the summer, you might notice that the ocean seems cooler than the air or sand. Even though energy from the Sun goes to the air, sand, and water at the same rate, the water’s temperature changes less than that of the air or sand.

As a substance is heated, its temperature change depends both on the amount of thermal energy added and the nature of the substance. For an equal mass of water and sand, about six times as much thermal energy is needed to raise the temperature of the water than the sand by 1°C. It’s not surprising, then, that the sand feels much warmer than the ocean. The amount of thermal energy needed to raise the temperature of 1 kg of some material by 1°C is called the **specific heat** of the material. Specific heat is measured in joules per kilogram per degree Celsius, which is written as J/(kg °C). **Table 1** shows the specific heats of some familiar materials.

Reading Check What is the specific heat of a material?

Figure 3 Thermal energy flows from the warmer ingredients inside the container to the ice-and-salt mixture around it.

Table 1 Specific Heat of Some Common Materials	
Substance	Specific Heat [J/(kg °C)]
Water	4,184
Ice	2,110
Asphalt	920
Glass	800
Iron	450

Visual Learning

Figure 3 Why is it necessary to stir the ice cream while it is freezing? *Stirring allows the ice cream mix to cool evenly and more quickly.*
L2 **IS** **Logical-Mathematical**

Reading Check

Answer Heat is thermal energy that flows from something with a higher temperature to something with a lower temperature.
Answer the amount of thermal energy that is needed to raise the temperature of 1 kg of the material by 1°C

Discussion

Specific Heat Why is water often used in cooling systems? *The specific heat of water is higher than that of most materials. This means that water will warm more slowly than other materials as thermal energy is added to it.*

Use Science Words

Word Origin Have students use their dictionaries to identify the origin of the word *thermal*. The word *thermal* comes from the Greek word *therme*, meaning “heat.” Many English words derive from this, including *thermos*.

Curriculum Connection

History Have a group of students report on the experiments of James Joule that quantitatively related thermal energy and work. *Joule used falling weights to turn paddles that stirred water and raised its temperature. He calculated the mechanical energy of the falling weights and the thermal energy from the increase in temperature of the water.* **L2** **IS** **Linguistic**

Science Journal

Body Heat Have students describe in their Science Journals how thermal energy flows when an oral thermometer is used to take someone’s temperature. *The thermometer usually has a temperature lower than that of a human body, 37°C (98.6°F). In the mouth, thermal energy moves from the body to the thermometer, raising the temperature of the material in the thermometer.* **L2** **IS** **Logical-Mathematical** **P**

Coastal Climates A narrow band of land that runs along coastal areas experiences little temperature difference throughout the year. The proximity to the water moderates the temperature.

Quick Demo

Comparing Specific Heat

Materials large beaker, crushed ice, water, three test tubes, sand (or table salt), iron filings, starch-based packing peanuts

Estimated Time 15 minutes

Procedure Partially fill a large beaker with crushed ice. Add water to fill voids in the ice. Place a thermometer in each test tube. Partially fill each test tube with sand, iron filings, or packing peanuts. Break up the packing peanuts, if needed. Make sure the thermometers don't touch the bottoms of the test tubes. They should be completely surrounded by the other material. Place the test tubes in the beaker of ice water. Record the temperature of each test tube every minute for 5 min. To remove the packing peanuts from the test tube, add water to the test tube to dissolve the peanuts.

Applying Math

Math Standards

National: 1, 4, 9

Florida: MA.B.2.4.1

Answer to Practice Problem

$$Q = m \times (T_{\text{final}} - T_{\text{initial}}) \times C \\ = (72 \text{ kg}) (25^{\circ}\text{C} - 20^{\circ}\text{C}) \\ (1,010 \text{ J/kg } ^{\circ}\text{C}) = 363,600 \text{ J}$$

Coastal Climates The high specific heat of water causes large bodies of water to heat up and cool down more slowly than land masses. As a result, the temperature changes in coastal areas tend to be less extreme than they are farther inland.

Changes in Thermal Energy The thermal energy of an object changes when its temperature changes. If Q is the change in thermal energy and C is the specific heat, the change in thermal energy can be calculated from the following equation:

Thermal Energy Equation

change in thermal energy (J) =

$$\text{mass (kg)} \times \text{change in temperature } (^{\circ}\text{C}) \times \text{specific heat } \left(\frac{\text{J}}{\text{kg } ^{\circ}\text{C}} \right)$$

$$Q = m(T_f - T_i)C$$

Applying Math

Solve a Simple Equation

CHANGE IN THERMAL ENERGY Find the change in thermal energy of a 20-kg wooden chair that warms from 15°C to 25°C if the specific heat of wood is $1,700 \text{ J/(kg } ^{\circ}\text{C})$.

IDENTIFY known values and the unknown value

Identify the known values:

A wooden chair with a mass of 20 kg $\xrightarrow{\text{means}} m = 20 \text{ kg}$

warms from 15°C to 25°C $\xrightarrow{\text{means}} T_i = 15^{\circ}\text{C}$ and $T_f = 25^{\circ}\text{C}$

the specific heat of wood is $1,700 \text{ J/(kg } ^{\circ}\text{C})$ $\xrightarrow{\text{means}} C = 1,700 \text{ J/(kg } ^{\circ}\text{C})$

Identify the unknown value:

What is the change in thermal energy $\xrightarrow{\text{means}} Q = ? \text{ J}$

SOLVE the problem

Substitute the known values into the thermal energy equation:

$$Q = m(T_f - T_i)C = (20 \text{ kg})(25^{\circ}\text{C} - 15^{\circ}\text{C})(1,700 \frac{\text{J}}{\text{kg } ^{\circ}\text{C}}) \\ = (20 \text{ kg})(10^{\circ}\text{C})(1,700 \frac{\text{J}}{\text{kg } ^{\circ}\text{C}}) = 340,000 \text{ kg } ^{\circ}\text{C} \frac{\text{J}}{\text{kg } ^{\circ}\text{C}} = 340,000 \text{ J}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the change in thermal energy you calculated by the mass and the specific heat given in the problem. The result should be the difference in temperature given in the problem.

Practice Problems

The air in a living room has a mass of 72 kg and a specific heat of $1,010 \text{ J/(kg } ^{\circ}\text{C})$. What is the change in thermal energy of the air when it warms from 20°C to 25°C ?

For more practice problems, go to page 879 and visit Math Practice at fl.gpscience.com.

Differentiated Instruction

Learning Disabled To help students calculate changes in thermal energy, make sure they know what each variable in the formula means, and show the places where numerical values are put in. Be sure to show them how to calculate the change in temperature. **L2 LS Logical-Mathematical**

Post Reading

Chart Text In their Science Journals, have students summarize the characteristics of thermal energy, kinetic energy, potential energy, and heat. Then, in groups, have students create a graphic that demonstrates how each type of energy is related to the other.

Measuring Specific Heat

The specific heat of a material can be measured using a device called a calorimeter, shown in **Figure 4**. The specific heat of a material can be determined if the mass of the material, its change in temperature, and the amount of thermal energy absorbed or released are known. In a calorimeter, a heated sample transfers thermal energy to a known mass of water. The energy absorbed by the water can be calculated by measuring the water's temperature change. The thermal energy released by the sample is equal to the thermal energy absorbed by the water.

Using a Calorimeter To measure the specific heat of a material, the mass of a sample of the material is measured, as is the initial temperature of the water in the calorimeter. The material then is heated, its temperature is measured, and the sample is placed in the water in the inner chamber of the calorimeter. The sample cools as thermal energy is transferred to the water, and the temperature of the water increases. The transfer continues until the sample and the water are at the same temperature. Then the initial and final temperatures of the water are known, and the thermal energy gained by the water can be calculated.

Figure 4 A calorimeter can be used to measure the specific heat of materials. The sample is placed in the inner chamber.

SECTION 1 REVIEW

Summary

Temperature

- The kinetic theory is a description of how the particles in a material are moving.
- The temperature of an object is a measure of the average kinetic energy of the particles that make up the object.

Thermal Energy and Heat

- Thermal energy is the sum of the kinetic and potential energies of the particles in an object.
- Heat is thermal energy that is transferred from an object at a higher temperature to an object at a lower temperature.

Specific Heat

- The specific heat of a material is the amount of thermal energy needed to raise the temperature of 1 kg of the material by 1°C.
- The change in thermal energy of an object can be calculated from this equation:

$$Q = m(T_f - T_i)C$$

Self Check

1. **Explain** how energy moves when you touch a block of ice with your hand.
2. **Describe** how the thermal energy of an object changes when the object's temperature changes.
3. **Infer** When thermal energy flows between two objects, does the temperature increase of one object always equal the temperature decrease of the other? Explain.
4. **Describe** how the particles in matter move, using the assumptions of the kinetic theory.
5. **Think Critically** Explain whether or not the following statement is true: For any two objects, the one with the higher temperature always has more thermal energy.

Applying Math

6. **Calculate** the change in thermal energy of the water in a pond with a mass of 1,000 kg and a specific heat of 4,184 J/(kg °C) if the water cools by 1°C.
7. **Calculate** the specific heat of a metal if 0.5 kg absorbs 9,000 J of thermal energy as it warms by 10°C.

SECTION 1 REVIEW

1. Thermal energy transfers from your hand to the block of ice as the particles in your hand strike the particles of ice where your hand touches the ice.
2. Temperature is the average kinetic energy of the particles in the object. Kinetic energy is one of the components of thermal energy—as
3. No. The temperature change depends on the specific heat of each material.
4. The particles in matter are constantly moving and colliding with other particles.
5. It is false. Thermal energy depends on the amount of material and the potential energy of the particles in the objects.
6. -4,184,000 J
7. 1,800 J/(kg°C)

3 Assess

DAILY INTERVENTION

Check for Understanding

Linguistic Have students write three sample test questions about the information in this section, then have students exchange papers. Have students write a complete answer to the sample questions they now have. Ask students to return the papers to the original owner to check the answers. Answer any questions that students may have. **L2 IS**

Reteach

Temperature, Thermal Energy, and Heat

Have students form small groups and draw concept maps that connect the following quantities: temperature, thermal energy, molecular motion, heat, mass, and specific heat. **Students should use short phrases to label the links on their concept maps.** **L2 IS**

COOP LEARN Visual-Spatial

Assessment

Process Ask students to imagine that equal masses of water and alcohol are put into identical pans and heated for ten minutes. At the end of ten minutes, the alcohol has a higher temperature. What does this tell you about the specific heat of alcohol? **The alcohol must have a lower specific heat since its temperature rose more with the same amount of thermal energy added.** Use **Performance Assessment in the Science Classroom**, p. 89.

Heat and States of Matter

Reading Guide

What You'll Learn

- **Describe** the differences in the four states of matter.
- **Explain** how the motion of particles in a material changes at the material's melting point and boiling point.
- **Explain** why thermal expansion occurs.

Why It's Important

You can use energy that is lost or gained when a substance changes from one state to another.

Review Vocabulary

force: a push or a pull that one object exerts on another

New Vocabulary

- plasma
- ☀ **heat of fusion**
- ☀ **heat of vaporization**

Four States of Matter

Every day you encounter different states of matter. Your lunch probably includes a solid and a liquid, such as pizza and a drink. The air you breathe is a gas. The Sun, lightning, and fluorescent lights contain a fourth state of matter called plasma. The differences between solids, liquids and gases are due to differences in the attraction between particles.

Solid State The spacing between particles is different for solids, liquids, and gases, as shown in **Figure 5**. The particles of a solid are packed closely together and are constantly vibrating in place. Because the attractions between particles are strong, solids have a fixed volume and shape.

Figure 5 In solids, strong attractive forces hold particles in place. Particles in liquids and gases do not have fixed arrangements. Particles are farther apart in gases than in solids and liquids.

Liquid State In a liquid the attractive forces between particles are weaker than in a solid. The particles can slide past each other, allowing liquids to flow and take the shape of their container. However, the attractive forces are strong enough to cause particles to cling together. As a result, liquids have a definite volume, but not a definite shape.

Reading Check Why do liquids flow?

Gas State In a gas, the particles are much farther apart than in a liquid or a solid. Because the particles are so far apart, the attractive forces between them are weak. In a gas the forces between particles are so weak that the particles no longer cling together. As a result, gases do not have a definite shape or volume.

Because the particles in a gas are so far apart, a gas contains mostly empty space. This means that the density of gases is much less than the density of solids and liquids. Also, the particles in a gas will spread throughout a given volume until they are distributed evenly. This process is called diffusion. Diffusion also occurs in solids and liquids, but occurs much more rapidly in gases.

INTEGRATE **Plasma State** The most common state of matter in the universe is the plasma state. **Plasma** is matter consisting of positively and negatively charged particles and does not have a definite shape or volume. It results from collisions between particles moving at such high speeds that electrons are knocked from the atoms, leaving only charged particles. All of the observed stars, including the Sun shown in **Figure 6**, contain plasma. Lightning bolts, neon and fluorescent tubes, and auroras also contain plasmas.

Changing States

If you hold an ice cube in your hand, you can see it change from a solid to a liquid. A liquid changes to a gas when a puddle of water disappears after a rain on a hot day. Adding thermal energy caused the solid ice to change to a liquid and the liquid water to become a gas. Changes in the thermal energy of a material can cause it to change from one state to another.

Science Online

Topic: States of Matter

Visit fl.gpscience.com for Web links to information about states of matter.

Activity Create a slide presentation about the states of matter using computer presentation software.

Figure 6 The Sun and other stars contain matter that is in the plasma state. Plasma usually exists where the temperature is extremely high.

Describe the plasma state.

SECTION 2 States of Matter 261

Reading Check

Answer The particles have gained enough kinetic energy to partially escape the attractive forces in the solid.

Quick Demo

Observing Salt Crystals

Materials salt crystals, microscope or magnifying lens

Estimated Time 10 minutes

Procedure Have students observe the regular, cubic shape of salt crystals under a microscope or with a magnifying lens.

Caption Answer

Figure 6 matter consisting of positively and negatively charged particles

Content Background

Plasma Over 99% of the visible universe is composed of plasma, found mostly in interstellar space and stars. Here on Earth, small amounts of plasma are used in the production of microchips and semiconductors. The challenge of controlling a large quantity of plasma is the main stumbling block in the development of a nuclear fusion reactor.

LAB DEMONSTRATION

Purpose to demonstrate the movement of gas particles

Materials balloon, vanilla flavoring, dropper

Procedure Use a dropper to put five drops of vanilla into a balloon. Close the bottle of vanilla flavoring so that a minimum

amount of vanilla odor is released. Blow up the balloon, tie it closed, then smell near the surface of the balloon.

Expected Outcome Students will detect the aroma of vanilla as it evaporates inside the balloon.

Assessment

Ask the students why they can smell the vanilla near the surface of the balloon. The moving particles of vanilla passed between the molecules of the stretched balloon.

Use an Analogy

Sporting Event States of matter are like the crowd at a sporting event. When seated, people are like particles in a solid. They can move in place but don't go anywhere. The people in the aisles are like particles in a liquid. They move past each other but aren't free to move far apart. Upon reaching the parking lot, the people are free to disperse, as are particles in a gas.

Activity

Altitude and Cooking Have students examine the labels of foods such as cake mixes. On Earth, air pressure decreases as altitude increases. Have students determine the effect of altitude on cooking time and temperature for these items. [L2] [IS] **Linguistic**

Purpose Students observe changes in volume due to change in state. [L2] [ELL] [IS] **Kinesthetic**

Materials plastic bowl or ice tray, marker or masking tape
Teaching Strategies Warn the students to not fill the bowl or ice tray completely full.

Analysis

1. The level of the ice is higher than the level of the water.
2. Particles in the solid state of water have more space between them than particles in liquid water.

Assessment

Process Have each student write up the procedure used and results obtained for this MiniLAB in a lab report. Use PASC, p. 119 [P]

Comparing States of Water

Procedure

1. Fill a **plastic bowl or ice tray** with **water**. Mark the level of the top surface of the water with a **marker** or piece of **masking tape**.
2. Place the container in a freezer overnight.
3. Remove the container from the freezer and observe the level of the ice that has formed.

Analysis

1. How does the level of ice compare with the level of water that you placed in the container?
2. Explain why the level of ice is different from the level of the water.

Melting What causes an ice cube to melt into liquid water? As the temperature of the ice increases, its particles move faster, and the attractive forces between them aren't strong enough to keep them in place. The particles can slip out of their ordered arrangement, and the ice melts. The temperature at which a solid begins to melt is its melting point. Energy is required for the particles to slip out of the ordered arrangement. The amount of energy required to change 1 kg of a substance from a solid to a liquid at its melting point is known as the **heat of fusion**.

Freezing The heat of fusion is also the energy released when a liquid freezes, or changes to a solid. If you lower a liquid's temperature, you decrease its particles' average kinetic energy, and they move slower. The attractive forces then are strong enough that the particles form an ordered arrangement.

Vaporization As the temperature of a liquid increases, the particles in the liquid move faster. As the particles move faster and become farther apart, the forces between them can become so weak that the particles no longer cling together. Then vaporization occurs as liquid changes into a gas. Vaporization can occur within the liquid or at the surface of the liquid. Vaporization that occurs at the surface of a liquid is called evaporation. Particles that enter the gas state have more energy than the particles left in the liquid. Evaporation causes the temperature of the liquid to decrease.

Boiling A second way that a liquid can vaporize is by boiling, shown in **Figure 7**. Unlike evaporation, boiling occurs throughout a liquid. It occurs only at a certain temperature depending on the pressure on the surface of the liquid. The boiling point of a liquid is the temperature at which the pressure of the vapor in the liquid is equal to the external pressure acting on its surface. This external pressure is a force pushing down upon a liquid, keeping particles from escaping. The **heat of vaporization** is the amount of energy required for 1 kg of the liquid at its boiling point to become a gas.

Figure 7 Boiling occurs throughout a liquid when the pressure of the pockets of gas forming in the liquid equals the pressure of the vapor at the surface of the liquid.

Explain the difference between boiling and evaporation.

Differentiated Instruction

English-Language Learners Have students make vocabulary study cards out of index cards. Have students write a vocabulary word in both languages on one side of the card. On the other side, write the definition of the word in both languages. Make a card for each vocabulary word in the chapter. Use the cards to study for quizzes and tests.

Caption Answer

Figure 7 Evaporation is vaporization that occurs at the surface of a liquid. It can occur at temperatures below the liquid's boiling point. Boiling is vaporization that occurs throughout the liquid at a specific temperature depending on the pressure at the surface of the liquid.

Condensation The heat of vaporization is also the amount of energy released during condensation, when a gas changes into a liquid. You've probably seen condensation form on the sides of a glass of ice water on a hot day. The cold glass reduced the temperature of nearby water vapor. The average kinetic energy of the water particles decreased, and the water vapor changed to a liquid. As shown in **Figure 8**, dew also is the result of condensation.

Reading Check

What change of state occurs during condensation?

Heating Curve of a Substance A graph representing water being heated from -20°C to 120°C is shown in **Figure 9**. This graph is called a heating curve because it shows the temperature change of water as thermal energy is added. There are two areas on the graph where the temperature does not change. One is at 0°C , where ice is melting. All of the energy absorbed by the ice at this temperature increases the potential energy of the water molecules. This causes water molecules to move farther apart and weakens the forces between molecules. However, the average kinetic energy of the water molecules doesn't change. As a result, the temperature remains constant during melting.

After the ice melts completely, adding additional energy causes the water molecules to move faster so that the temperature of the water increases. At 100°C , the water changes from a liquid to a gas. As the water absorbs energy, only the potential energy of the water molecules increases and the temperature of the water doesn't change. After the liquid water has changed completely into a gas, the temperature of the gas increases as energy is added.

The Heating Curve of Water

Figure 8 The formation of dew is an example of condensation.

Dew forms when the air around matter, such as spider webs, cools enough so that water vapor in the air changes to a liquid.

Identify the change in state that occurs when dew evaporates.

Figure 9 This graph shows the heating curve of one gram of water from -20°C to 120°C . At **a** and **c**, the energy absorbed causes water molecules to move faster and so the temperature increases. At **b** and **d**, the water changes from one state to another. The added energy increases the potential energy of the water molecules, but not the kinetic energy, so the temperature doesn't change.

Teacher FYI

Effects of Pressure At 1 atm, water freezes at 0°C and boils at 100°C . At different pressures, water goes through these changes at different temperatures. In fact, when the pressure is 0.61 kPa and the temperature is 0.01°C , water can exist as a solid, a liquid, and a gas. This is called the triple point for water.

Reading Check

Answer the gas state to the liquid state

Visual Learning

Figure 9 Ask a volunteer to read aloud the section of the SE text that describes the graph while the rest of the students follow the graph with their fingers. Discuss with students the effect of adding heat to water at different temperatures. **L1** **ELL**

AS Auditory-Musical

IDENTIFYING

Misconceptions

Steam Students may think that steam is water in the gaseous state. Actually, steam is made of liquid water droplets that have condensed from gaseous water vapor in the air.

Caption Answer

Figure 8 the liquid state to the gas state

Cultural Diversity

Sharing Languages In English-speaking countries, the three states of water are called *ice*, *water*, and *water vapor*. In Spanish-speaking countries the words are *hielo*, *agua*, and *vapor*. If you have students in your class that speak other languages, ask them to share the terms they know with the class.

Reading Strategy

Use Graphs Ask students to look at the graph in **Figure 9** as they are reading Heating Curve of a Substance. Have them read the labels on both axis and the range of numbers on the scales. Ask them to notice the temperatures at which there are two "jumps" or "spikes" in the curve. What occurs at 0° and 100° centigrade?

Discussion

States of Matter Around Us Ask students to think about shopping malls and how different states of matter are used to decorate the mall and make shopping more pleasant. Items may include fountains (liquid), helium-filled balloons (gas), marble floors (solid), and fluorescent and neon lighting (plasmas).

IDENTIFYING

Misconceptions

Sweating and Evaporation If you ask students whether sweating is a heating or cooling process, many may initially say it's a heating process, thinking of the fact that they sweat when they feel warm. Lead them to understand that being warm causes the body to sweat in an effort to cool down; therefore, evaporation must be a cooling process.

Figure 10 This expansion joint enables the road surface on this bridge to expand without causing the road surface to crack or buckle.

Thermal Expansion

When you have gone over a highway bridge in a car, you might have noticed the gaps between sections of the bridge, such as the gap shown in **Figure 10**. This gap is called an expansion joint. The materials that make up the bridge and the road surface expand when they get warmer. Expansion joints provide space for these materials to expand on hot days without causing the materials to become warped or cracked.

The Thermal Expansion of Matter The kinetic theory explains why an object expands when its temperature increases. According to the kinetic theory, the particles in an object are in constant motion. The speed of these particles increases as the temperature of the object increases. As the particles move faster, the attractive forces between them become weaker and the distance between particles increases. The increased separation between the particles results in the expansion of the object and the size of the object increases. When a material cools, the particles in the material move more slowly and become closer together. As a result, the material contracts and its dimensions decrease.

Thermal Expansion of Liquids The forces between the particles in liquids are usually weaker than the forces between the particles in a solid. As a result, the same temperature increase usually causes liquids to expand much more than solids. For example, the liquid in the thermometer shown in **Figure 11** expands as its temperature increases. However, the dimensions of the glass tube containing the liquid hardly change at all. This causes the height of the liquid column in the tube to increase as the temperature of the liquid increases. If the glass tube expanded as much as the liquid, the height of the liquid column wouldn't change as the temperature changed.

Figure 11 The liquid in the thermometer tube expands as its temperature increases. Because the tube expands much less than the liquid, the height of the liquid column increases as the temperature increases.

Differentiated Instruction

Challenge Find out what the concept of absolute zero means. How do real and ideal gases behave at absolute zero? Which two widely used temperature scales are absolute temperature scales? Prepare a report of your research findings about absolute zero and share it with your class. **Kelvin and Rankine are absolute temperature scales.** L3

Thermal Expansion of Gases In a gas, the forces between particles are much weaker than they are in liquids. As a result, gases expand even more than liquids for the same increase in temperature. When thermal expansion occurs, the volume of the material increases. Recall that the density of an object is the mass of the object divided by its volume. Because the material's volume has increased, but its mass hasn't changed, the material becomes less dense as it expands.

Reading Check How does the density of a material change when the material expands?

The decrease in density caused by thermal expansion enables the hot-air balloon in **Figure 12** to rise. The air inside the balloon is heated by a burner. The hot air in the balloon expands and becomes less dense than the cooler air outside the balloon. As a result, the hot-air balloon is pushed upward by the denser, cooler air around it.

Figure 12 The air inside the hot-air balloon expands as it is heated. Its density decreases and the balloon rises.

Reading Check

Answer it decreases

Post Reading

Essays Explain to students the concept of comparison and contrast. Then, have them write an essay comparing and contrasting the effects of thermal expansion in solids, liquids, and gases. Model the format by showing them how they can write about each in a separate paragraph. Encourage them to support their points with everyday examples of thermal expansion.

3 Assess

section 2 review

Summary

Four States of Matter

- In solids, particles are held in place by strong attractive forces. Solids have a definite volume and shape.
- In liquids, the attractive forces are weaker and particles can move past each other. Liquids have a definite volume, but no definite shape.
- In gases, the attractive forces between particles are weakest. Gases have neither a definite volume nor shape.
- A plasma is made of electrically charged particles.

Changing States

- The heat of fusion is the amount of energy needed to change 1 kg of a material at its melting point from a solid to a liquid.
- The heat of vaporization is the amount of energy needed to change 1 kg of material at its boiling point from a liquid to a gas.

Self Check

1. **Compare and contrast** solids, liquids, gases, and plasma.
2. **Explain** whether the temperature of a substance must increase when thermal energy is added to the substance.
3. **Explain** how the forces between water molecules in an ice cube change when the ice cube melts.
4. **Think Critically** The atmospheric pressure on a mountain peak is lower than the atmospheric pressure at sea level. Compare the boiling point of water at sea level to its boiling point on the mountain peak.

Applying Math

5. **Calculate** the amount of thermal energy required to change a 0.45-kg block of ice at 0°C to water at 0°C if the heat of fusion of water is 334,000 J/kg.
6. **Calculate** The heat of vaporization for water is 2.26×10^6 J/kg. What mass of liquid water at 100°C can be changed to water vapor at 100°C by adding 1.0×10^6 J of thermal energy to the liquid water?

More Section Review fl.gpscience.com

SECTION 2 States of Matter 265

section 2 review

1. As the temperature increases, particles move faster on average and become farther apart. The volume occupied by the particles increases but the mass of the particles doesn't change. As a result, the density decreases.
2. When a substance is undergoing a phase change, the temperature doesn't change as thermal energy is added to the substance.
3. When the ice cube melts, the forces between molecules become weaker.
4. The boiling point at sea level is higher.
5. $(0.45 \text{ kg})(334,000 \text{ J/kg}) = 150,000 \text{ J}$
6. $(1.0 \times 10^6 \text{ J}) / (2.26 \times 10^6 \text{ J/kg}) = 0.44 \text{ kg}$

M.A.B.2.4.1

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students make an illustration showing how solid, liquid, and gas particles behave and interact.

Reteach

Demonstrating the States of Matter

Have students make a snow globe to model the behavior of solids, liquids, and gases. Have students use a small jar with a lid as the container. Fill the jar with enough glitter to cover the bottom of the jar to a depth of 1 cm. Fill the jar with water, mineral oil, or baby oil. The particles will move slower in oil. Have students use their snow globe to model the behavior of solids, liquids, and gases.

Assessment

Process Ask students to draw diagrams illustrating what determines the boiling point of a liquid. At the boiling point, the pressure from molecules leaving the liquid to become gas is equal to the atmospheric pressure above them. Use PASC, p. 127.

Section Focus Transparency **Steam Power** **Chapter 9**

Steam engines convert heat energy into mechanical energy. The engines use heat energy to produce steam that powers the locomotive. During the 1800s, steam engines were used in factories and mills and to propel boats and trains.

1. What are some fuels that the engines might burn to create steam?
2. Describe how liquid water is different from steam (gaseous water).
3. What changes steam energy to mechanical energy in the locomotive?

L2

Reading Guide

What You'll Learn

- **Compare and contrast** the transfer of thermal energy by conduction, convection, and radiation.
- **Compare and contrast** thermal conductors and insulators.
- **Explain** how thermal insulators are used to control the transfer of thermal energy.

Why It's Important

You must be able to control the flow of thermal energy to keep from being too hot or too cold.

Review Vocabulary

density: the mass per unit volume of a substance

New Vocabulary

- conduction
- convection
- radiation
- thermal insulator

Ways to Transfer Thermal Energy

When water is heated on a stove or when a hot slice of pizza becomes cool enough to eat, thermal energy is transferred from one place to another. Thermal energy can be transferred from one place to another by conduction, convection, or radiation.

Conduction

According to the kinetic theory, particles in matter are always in random motion. Thermal energy can be transferred when particles collide. This transfer of thermal energy between colliding particles is **conduction**. **Figure 13** shows a metal pot being heated over a fire. The metal atoms nearest the fire absorb the most thermal energy, causing their kinetic energy to increase. Kinetic energy is transferred when these faster-moving atoms collide with slower-moving particles. As these collisions continue, thermal energy is transferred throughout the pot. When thermal energy is transferred by conduction, it is transferred by the collisions between particles, not by the movement of matter.

Figure 13 Conduction occurs within the metal of this pot as faster-moving particles transfer thermal energy when they collide with slower-moving particles.

Tie to Prior Knowledge

Conductors Ask students if they have ever been burned by touching a hot object. What type of material was the object made of? It probably was made of a good conductor that transferred its thermal energy to the student's hand by conduction.

Make Connections Tell students that thermal energy is common in our lives. On a stove, a pan gets hot by contacting a hot burner. This is conduction. In an oven, a red-hot coil cooks food by radiation. A convection oven cooks food by using a fan to move hot air around the oven.

Lab Worksheets, pp. 5–6

Life Science Critical Thinking/Problem Solving, p. 14

Thermal Conductors Thermal energy can be transferred by conduction in all materials. However, the rate at which thermal energy is transferred depends on the material. A material in which thermal energy is transferred easily is called a thermal conductor. The conduction of thermal energy in solids and liquids is faster than in gases. Particles in gases are farther apart than in solids or liquids and collide less frequently. Therefore, gases are poorer thermal conductors than solids or liquids. Solids usually are better thermal conductors than liquids or gases. The best thermal conductors are metals.

Convection

Unlike solids, liquids and gases can flow and are classified as fluids. In fluids, thermal energy can be transferred by convection. **Convection** is the transfer of thermal energy in a fluid by the movement of fluid from place to place. When convection occurs, particles with more energy transfer energy to other particles in the fluid as they move from place to place.

As the particles move faster, they tend to be farther apart. As a result, a fluid expands as its temperature increases. Recall that density is the mass of a material divided by its volume. When a fluid expands, its volume increases, but its mass doesn't change. The density of the fluid therefore decreases. The same is true for parts of a fluid that have been heated. The density of the warmer fluid is less than that of the surrounding cooler fluid.

Convection Currents The difference in densities between warmer and cooler fluids can cause convection currents to occur.

Figure 14 shows the formation of convection currents in a beaker of water that is being heated from the bottom. Warm water at the bottom of the beaker is less dense than the cooler water above it. Because the warmer water is less dense, it is forced upward by the sinking cooler water. As it rises, the warm water transfers thermal energy to the cooler water around it. When the warm water cools, it becomes denser than the surrounding warmer water and sinks to the bottom of the beaker. The rising and sinking water forms a convection current. In this way, convection currents transfer thermal energy by the movement of water from place to place.

Figure 14 Convection currents result when heated fluid rises and cooler fluid sinks.

SECTION 3 Transferring Thermal Energy 267

Comparing Thermal Conductors

Procedure

1. Obtain a **plastic spoon**, a **metal spoon**, and a **wooden spoon** with similar lengths.
2. Stick a small **plastic bead** to the handle of each spoon with a dab of **butter or wax**. Each bead should be the same distance from the tip of the spoon.
3. Stand the spoons in a **beaker**, with the beads hanging over the edge of the beaker.
4. Carefully pour about 5 cm of **boiling water** in the beaker holding the spoons.

Analysis

1. Describe how heat was transferred from the water to the beads.
2. Rank the spoons in their ability to conduct heat.

2 Teach

Use an Analogy

Kicking a Soccer Ball Explain that transferring energy to a soccer ball by kicking it is similar to transferring energy by conduction. A collision with a person's foot causes energy to be transferred to the soccer ball.

Purpose Students observe the thermal conductivity of a metallic alloy, plastic, and wood. **L2**

ELL **IS** **Kinesthetic**

Materials Each group will need: metallic, plastic, and wooden spoons (similar length), three small plastic beads, three small dabs of butter, beaker, and boiling water

Teaching Strategies Have students place their beakers on paper towels to catch butter drips.

Safety Precautions Students should be careful when handling boiling water.

Analysis

1. by conduction through the spoons and the butter
2. metal, plastic, then wood

Assessment

Process Have students draw cartoons explaining why items in the kitchen are made of insulators or conductors. Use PASC, p. 133. **P**

Visual Learning

Figure 13 Using the figure as a guide, have several students explain how heat travels from the bottom of the frying pan up to and through the handle.

Visualizing Convection Currents

Have students examine the pictures and read the captions. Then ask the following questions.

Why does the air lose its moisture as it rises and cools at the equator? **The water vapor in the air condenses as the air cools.**

Why does the dry air create a cone of deserts at the tropics? **The dry air causes moisture to evaporate out of the ground. Since there is a continuous stream of hot, dry air that blows across the land, any water on the ground is vaporized and carried away. In addition to this drying process, there is insufficient rainfall to replenish the moisture.**

Activity

World Map Have students obtain or draw a world map. Ask students to locate and mark the equator and both tropics. Have them find the major rain forests and deserts of the world and mark them on their maps. [L2]

ELL **Visual-Spatial**

Quick Demo

Heat and Convection

Materials three 250-mL beakers, one 600-mL beaker, food coloring, dropper, hot plate, ice

Estimated Time 10 minutes

Procedure Fill the 600-mL beaker two-thirds full of ice. Put water in the small beakers. Using the dropper, gently place a drop of food coloring in the bottom of each beaker. Place one beaker on a hot plate, one on the ice, and one in your hand. Since heat causes convection to occur more rapidly, the food coloring will disperse more rapidly in the warmer beakers.

Figure 15

When the Sun beats down on the equator, warm, moist air begins to rise. As it rises, the air cools and loses its moisture as rain that sustains rain forests near the equator. Convection currents carry the now dry air farther north and south. Some of this dry air descends at the tropics, where it creates a zone of deserts.

RAIN FOREST The rain forest zone forms a belt that encircles the globe on either side of the equator. The photograph below shows a rain forest near the Congo River in central Africa.

DESERT Like many of the great desert regions of the world, the Sahara, in northern Africa, is largely a result of atmospheric convection currents. Here, a group of nomads gather near a dried-up river in Mali.

268 CHAPTER 9 Heat and States of Matter

Differentiated Instruction

Challenge Have students research the living conditions of the people in the desert areas discussed in this feature. Students should find out how they obtain food, shelter, and how they cope with their harsh conditions. Ask students to give an oral report of their findings to their class. [L2] **IS**

Auditory-Musical

Reading Strategy

Reciprocal Teaching Have students read Visualizing Convection Currents. Ask them to study this global weather pattern until they can explain it in their own words to a partner.

Deserts and Rain Forests Earth's atmosphere is made of various gases and is a fluid. The atmosphere is warmer at the equator than it is at the north and south poles. Also, the atmosphere is warmer at Earth's surface than at higher altitudes. These temperature differences create convection currents that transfer thermal energy to cooler regions. **Figure 15** shows how these currents create rain forests and deserts in different regions.

Radiation

Earth is warmed by energy from the Sun, but how does that energy travel through space? Almost no matter exists in the space between Earth and the Sun, so thermal energy cannot be transferred by conduction or convection. Instead, the Sun's energy reaches Earth by radiation.

Radiation is the transfer of energy by electromagnetic waves. These waves travel through space even when no matter is present. Energy transferred by radiation often is called radiant energy. When you stand near a fire, much of the warmth you feel is caused by radiation transferring thermal energy to your skin. Radiation can pass through solids, liquids, and gases, but the transfer of energy by radiation is most important in gases.

Radiant Energy and Matter When radiation strikes a material, some energy is absorbed, some is reflected, and some may be transmitted through the material. The amount of energy that does each depends on the material. Light-colored materials reflect more radiant energy, while dark-colored materials are more absorbent. When a material absorbs radiant energy, its thermal energy increases. **Figure 16** shows what happens to radiant energy from the Sun as it reaches Earth.

For example, when a car sits out in the Sun, some of the Sun's radiation passes through the car windows. Materials inside the car absorb some of this radiation and become hot.

The Flow of Thermal Energy

You do a number of things every day to control the flow of thermal energy. When it's cold outside you wear a coat. You use an oven mitt when handling a hot dish. In each case, you use an insulating material to help reduce the flow of thermal energy. Your coat keeps you warm by reducing the flow of thermal energy from your body to the surrounding air. The oven mitt keeps your hand from being burned by reducing the flow of thermal energy from the hot dish to your hand.

Figure 16 Not all of the Sun's radiant energy reaches Earth's surface. Some of it is reflected or absorbed by the atmosphere. Even some of the radiation that reaches Earth's surface is reflected.

Use Science Words

Word Origins Have students look up the origins of the words *conduction*, *convection*, and *radiation* in a dictionary. Students should find that the words come from the Latin roots *conducere* (to lead), *con-vehere* (to bring together), and *radius* (ray), respectively. Ask volunteers to connect the meaning of each word with its root. **L2 ELL**

LS Linguistic

IDENTIFYING Misconceptions

Radiation Students may confuse radiation as a form of thermal energy transfer with nuclear radiation or radioactivity. Both types of radiation involve the sending of energy as waves or particles. In nuclear radiation, radioactive nuclei of atoms break down and emit particles and electromagnetic waves. In thermal radiation, matter emits electromagnetic waves of much lower frequency.

Virtual Labs

Insulation How do the insulation properties of various materials compare?

Differentiated Instruction

Learning Disabled Obtain samples of insulation materials for students to observe. Point out the air pockets in the insulation samples for students to see. Materials may include fiber fill, fleece, and building insulation. If fiberglass is used, put the sample in a plastic bag to protect the students. Do not allow students to remove the material from the bag. **L2 ELL LS** Visual-Spatial

✓ Reading Check

Answer Air is a good insulator. It reduces the rate at which thermal energy is transferred to the colder outside.

Post Reading

Chart Text Allow students to work in groups to create charts that compare the action of particles and states of matter in conduction, convection, and radiation. Instruct students that each chart should contain a variety of methods of presenting the information, such as direct quotes from the text, paraphrases, or illustrations.

3 Assess

DAILY INTERVENTION

Check for Understanding

Interpersonal Have students quiz one another on the three means by which thermal energy is transferred. **conduction, convection, radiation** **L2 IS**

Reteach

Heat Transfer Have students brainstorm about which method of thermal energy transfer would most concern an astronaut floating in space. **Thermal energy radiated between the suit and outer space would be of serious concern.** **L3 IS Logical-Mathematical**

✓ Assessment

Oral Have students describe the forms of thermal energy transfer they might experience when they go to a beach or pool on a hot day. How might they use insulation to increase their comfort? Answers might include conduction from hot sand or concrete, convection while in the water, and radiation from the Sun. Insulators could include sandals and a towel. Use PASC, p. 89.

Figure 17 The fibers of this insulating material contain air spaces that are good thermal insulators. They reduce the rate at which thermal energy flows in the material.

Thermal Insulators

A jacket and an oven mitt are examples of thermal insulators. A material in which thermal energy moves slowly is a **thermal insulator**. Examples of materials that are thermal insulators are wood, some plastics, fiberglass, and air. Materials that are good conductors of thermal energy, such as metals, are poor thermal insulators.

Gases, such as air, are usually much better thermal insulators than solids or liquids. Some types of insulating material contain many pockets of trapped air. These air pockets are poor conductors of thermal energy and also keep convection currents from forming. Winter jackets often are made of insulating materials consisting of fibers, like the ones shown in **Figure 17**, that trap air and hold it next to you. This trapped air slows the flow of your body heat to the colder air outside the jacket. Gradually, the air trapped by the material is warmed by your body heat. Underneath the jacket you are wrapped in a blanket of warm air.

✓ **Reading Check** Why is a material that traps air a good insulator?

section 3 review

Summary

Conduction

- Conduction is the transfer of thermal energy by collisions between particles.
- Conduction occurs in solids, liquids, and gases. Metals are the best conductors of heat.

Convection

- Convection is the transfer of thermal energy by the movement of warmer and cooler material.
- Convection occurs in fluids. Rising of warmer fluid and sinking of cooler fluid forms a convection current.

Radiation

- Radiation is the transfer of energy by electromagnetic waves.

Thermal Insulators

- Thermal energy moves slowly in thermal insulators. Thermal insulators are used to control the flow of thermal energy.

Self Check

1. **Explain** why convection can occur in fluids but not in solids.
2. **Explain** why the air temperature near the ceiling of a room tends to be warmer than near the floor.
3. **Predict** whether plastic foam, which contains pockets of air, would be a good conductor or a good insulator.
4. **Describe** how a convection current occurs.
5. **Think Critically** Several days after a snowfall, the roofs of some homes on a street have almost no snow on them, while the roofs of other houses are still snow covered. Describe what would cause this difference.

Applying Math

6. **Calculate Solar Radiation** Averaged over a year in the central United States, radiation from the Sun transfers about 200 W to each square meter of Earth's surface. If a house is 10 m long by 10 m wide, how much solar energy falls on the house each second?

section 3 review

1. In solids, particles are held in place by strong forces and vibrate about a fixed position. The particles in a fluid can move throughout the fluid.
2. In warm air particles are farther apart, making the warm air less dense than the cool air.
3. It would be a good insulator, because thermal energy would move slowly through the air pockets.
4. If the fluid is heated from below, the warmer fluid rises. Cooler fluid sinks to the bottom where it is heated, and then rises. The process continues until all the fluid is at the same temperature.
5. The snow-covered houses are better insulated. Not enough thermal energy escaped to melt the snow.
6. $(200 \text{ W}) / (1 \text{ m}^2) = x / (100 \text{ m}^2); x = 20,000 \text{ W}$

Convection in Gases and Liquids

A hawk gliding through the sky will rarely flap its wings. Hawks and some other birds conserve energy by gliding on columns of warm air rising up from the ground. These convection currents form when gases or liquids are heated unevenly and the warmer, less dense fluid is forced upward.

Real-World Problem

How can convection currents be modeled and observed?

Goals

- **Model** the formation of convection currents in water.
- **Observe** convection currents formed in water.
- **Observe** convection currents formed in air.

Materials

burner or hot plate	500-mL beaker
water	black pepper
candle	

Safety Precautions

WARNING: Use care when working with hot materials. Remember that hot and cold glass appear the same.

Procedure

1. Pour 450 mL of water into the beaker.
2. Use a balance to measure 1 g of black pepper.
3. Sprinkle the pepper into the beaker of water and let it settle to the bottom of the beaker.

4. Heat the bottom of the beaker using the burner or the hotplate.
5. **Observe** how the particles of pepper move as the water is heated and make a drawing showing their motion in your Science Journal.
6. Turn off the hot plate or burner. Light the candle and let it burn for a few minutes.
7. Blow out the candle and observe the motion of the smoke.
8. Make a drawing of the movement of the smoke in your Science Journal.

Conclude and Apply

1. **Describe** how the particles of pepper moved as the water became hotter.
2. **Explain** how the motion of the pepper particles is related to the motion of the water.
3. **Explain** how a convection current formed in the beaker.
4. **Explain** why the motion of the pepper changed when the heat was turned off.
5. **Predict** how the pepper would move if the water were heated from the top.
6. **Describe** how the smoke particles moved when the candle was blown out.
7. **Explain** why the smoke moved as it did.

Communicating Your Data

Compare your conclusions with other students in your class.

Assessment

Process Ask each student to make an events chain for each of the convection currents observed. Use **Performance Assessment in the Science Classroom**, p. 163. **L2 ELL AS Visual-Spatial**

Communicating Your Data

Have each group observe the convection current patterns created by the experiments of other groups. Ask students to explain any differences in results.

Real-World Problem

Purpose Students will model and observe convection currents.

L2 ELL AS Kinesthetic

Process Skills make models, observe, record data, predict

Time Required one class period

Alternate Materials Other fine-grained spices that are insoluble in water can replace the black pepper.

Safety Precautions Caution students never to taste foods during science class. Caution them not to touch the hot plate when it is on.

Procedure

Teaching Strategy Ask students to bring insoluble particles from home to be used during their experiments.

Conclude and Apply

1. The particles swirled upward.
2. As the water heated, the convection currents in the water carried the black pepper upward.
3. The water was hotter in the bottom of the beaker because it was nearer the heat source. The hot water rose in the beaker and the cold water sank.
4. There was no longer a temperature gradient in the beaker, so convection stopped.
5. The pepper would stay on the top because hot water is less dense than cold water.
6. The smoke rose as long as there was a heat source. The rise of the smoke became slower as the wick cooled.
7. Smoke particles were carried upward by the convection currents in air.

Using Thermal Energy

SC.B.1.4.6 The student knows that the first law of thermodynamics relates the transfer of energy to the work done and the heat transferred. **SC.B.1.4.7** The student knows that the total amount of usable energy always decreases, even though the total amount of energy is conserved in any transfer.

1 Motivate

An editable Microsoft® PowerPoint® presentation is available on **Interactive Chalkboard** CD-ROM.

★ FCAT Vocabulary

What You'll Learn

- **Describe** the first and second laws of thermodynamics.
- **Explain** how an internal combustion engine converts thermal energy to mechanical energy.
- **Describe** how the entropy of the universe changes when any event occurs.

Why It's Important

Imagine your life without heating systems, cooling systems, or cars.

Review Vocabulary

work: the product of the force exerted on an object and the distance the object moves in the direction of the force

New Vocabulary

- ★ **first law of thermodynamics**
- ★ **second law of thermodynamics**
- **entropy**

How is thermal energy used?

If you've ever lit a campfire to keep warm or turned on a stove to boil water, you've used thermal energy. Heating a house and using a gasoline engine to mow a lawn are other ways that thermal energy is used. Sometimes thermal energy is transferred to an object to heat it, as when water is boiled or a room is heated. Sometimes thermal energy is converted into work.

Heating Systems

Figure 18 In a forced-air system, heated air is blown through ducts that lead to rooms in the building.

Almost everywhere in the United States a heating system is needed to make indoor temperatures comfortable on cold days. Heating systems add thermal energy to the interiors of rooms. The

best heating system for a building depends on the local climate and how the building is constructed.

Forced-Air Systems The most common type of heating system in use today is the forced-air system, as shown in **Figure 18**. In this system, fuel is burned in a furnace and heats a volume of air. A fan blows the heated air through a series of large pipes called ducts. The ducts lead to openings called vents in each room. Cool air is returned through additional vents to the furnace, where it is reheated.

Home and Community Involvement, p. 25

Radiator Systems Before forced-air systems were widely used, many homes and buildings were heated by radiators. A radiator is a closed metal container that contains hot water or steam. The thermal energy contained in the hot water or steam is transferred to the air surrounding the radiator by conduction. This warm air then moves through the room by convection.

In radiator heating systems, fuel burned in a central furnace heats a tank of water. A system of pipes carries the hot water to radiators in the rooms of the building. After the water cools, it flows through the pipes back to the water tank, and is reheated.

Electric Heating Systems Unlike forced-air and radiator systems, electric heaters, like the one in **Figure 19**, convert electrical energy to thermal energy. In an electric heating system, electrically heated coils placed in floors and in walls heat the surrounding air by conduction and convection. Electric heating systems are not as widely used as forced-air systems. However, in warmer climates the walls and floors of some buildings may not be thick enough to contain pipes and ducts. Then an electric heating system might be the only practical way to provide heat.

Figure 19 Electric heaters convert electrical energy to thermal energy. Thermal energy is transferred to the room mainly by radiation and convection.

Discussion

Heating Water Why is water rather than other fluids used in home heating systems? *The specific heat of water is high compared with that of other fluids. Thus, it carries more thermal energy per unit of mass and loses it more slowly, keeping the room warm longer.* [L2] [AS]
Logical-Mathematical

Quick Demo

Observe Radiant Heating

Materials electric space heater

Estimated Time five minutes

Procedure Bring a small electric space heater to class. Plug the heater in and have students put their hands near the heater to feel the thermal energy. Explain to students that the wires become hot because of their electrical resistance. Thermal energy is transferred to the room by radiation. A small fan in some heaters helps transfer the thermal energy into the room.

Integrate History

Thermodynamics and the Steam Engine By the end of the eighteenth century, the steam engine was being used in manufacturing and transportation, leading to a wide-spread change in society called the industrial revolution. A young French engineer named Sadi Carnot (1796–1832) studied how the efficiency of steam engines could be improved. His work provided the basis for the development of thermodynamics by others in the nineteenth century. Research the life of Sadi Carnot and write a paragraph describing the results of his studies.

Thermodynamics and the Steam Engine Carnot's great contribution that gave birth to thermodynamics was the idea that the efficiency of any engine, such as a steam engine, that relies on the transfer of thermal energy to do work is limited by the temperature difference between the "hot" input and "cold" output. The greater the ratio of input to output temperatures (measured on the Kelvin scale), the greater the engine's ideal efficiency. However, no engine can convert 100% of its input thermal energy to useful work. To do so would require that the cold output temperature be 0K, or absolute zero.

Thermodynamics

There is another way to increase the thermal energy of an object besides heating it. Have you ever rubbed your hands together to warm them on a cold day? Your hands get warmer and their thermal energy and temperature increase. You did work on your hands by rubbing them together. The work you did caused the thermal energy of your hands to increase. Thermal energy, heat, and work are related. The study of the relationship among thermal energy, heat, and work is thermodynamics.

Heating and Work Increase Thermal Energy You can warm your hands by placing them near a fire. Thermal energy is added to your hands by radiation. You can make your hands even warmer by rubbing them together and holding them near a fire. Both the work you do and energy from the fire increase the thermal energy of your hands.

In the example above, your hands can be considered as a system. A system can be a group of objects, such as a galaxy or a car's engine, or something as simple as a ball. In fact, a system is anything you can draw a boundary around. The energy transferred to a system is the amount of energy flowing into the system across the boundary. Heating a system transfers energy to the system. The work done on a system is the work done by something outside the system's boundary.

Cultural Diversity

Home Heating Have students find out how the Inuit use convection currents to regulate temperature inside igloos. The Inuit make the entranceways to their igloos lower than the inside. Because cold air is denser than warm air, the coldest air in the igloo sinks into the entranceway, leaving the warmer air inside the igloo. [L3] [AS] **Logical-Mathematical**

Science Journal

Heating Systems Have students investigate the types of heating that are common in your area and why they are common. Find information about initial cost, efficiency, and maintenance requirements of different systems. Have students write their findings in their Science Journals. [L2]

Inquiry Lab

Passive Solar Heating

Purpose To research, explore, and observe passive solar heating, have students design and construct box models of buildings that include design elements for passive solar heating. **L2** **ELL**

IS Kinesthetic

Possible Materials small boxes such as shoe boxes, cardboard, assorted sheets of colored paper, clear sheeting such as overhead transparencies, insulating materials, resources to research passive solar heating

Estimated Time two weeks outside class time

Teaching Strategies

- Compass orientation of the building can maximize Sun exposure.
- Students should have windows exposed to the Sun to collect solar energy.
- Buildings should be insulated to retain thermal energy.
- Windows should have provisions for blocking the Sun during the summer to maintain comfort in the building.
- The color and type of flooring materials should be considered for thermal energy absorption.
- Students may provide a way to test their design. Have students take temperature measurements to show that a comfortable temperature is maintained.
- Students may find other design elements that should be included during their research.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Figure 20 A bicycle air pump can be a system. Work is done on the system by pushing down on the handle. This causes the pump to become warm and thermal energy is transferred from the system to the air around it.

Infer if the air pump is an open or a closed system.

Science Online

Topic: Solar Heating

Visit fl.gpscience.com for Web links to information about heating systems that use solar energy to heat buildings.

Activity Draw a diagram showing how an active solar heating system is used to heat a home.

The First Law of Thermodynamics According to the **first law of thermodynamics**, the increase in thermal energy of a system equals the work done on the system plus the thermal energy transferred to the system. Doing work on a system is a way of adding energy to a system, as shown in **Figure 20**. As a result, the temperature of a system can be increased by heating the system, doing work on the system, or both. The first law of thermodynamics is another way of stating the law of conservation of energy. The increase in energy of a system equals the energy added to the system.

Closed and Open Systems A system is an open system if thermal energy flows across the boundary or if work is done across the boundary. The energy of an open system can change. If no thermal energy flows across the boundary and no outside work is done, the system is a closed system. According to the first law of thermodynamics, the thermal energy of a closed system doesn't change. Energy might change form within the system, but the total energy of the system doesn't change.

The Second Law of Thermodynamics When thermal energy flows from a warm object to a cool object, the first law of thermodynamics is satisfied. The increase in thermal energy of the cool object equals the decrease in thermal energy of the warm object. Energy is neither created or destroyed.

Reading Check

How does the flow of thermal energy from a warm object to a cool object satisfy the first law of thermodynamics?

Can thermal energy flow spontaneously from a cool object to a warm object? This never happens, but it doesn't violate the first law of thermodynamics. The first law requires only that energy be conserved. The first law would be satisfied if the decrease in thermal energy of the cool object equaled the increase in thermal energy of the warm object.

However, the flow of thermal energy spontaneously from a cool object to a warm object never happens because it violates another law—the second law of thermodynamics. One way to state the **second law of thermodynamics** is that it is impossible for thermal energy to flow from a cool object to a warmer object unless work is done. For example, if you hold an ice cube in your hand, no work is done. As a result, thermal energy flows only from your warmer hand to the colder ice.

Reading Check

Answer According to the first law of thermodynamics, the increase in thermal energy of the cool object equals the decrease of thermal energy of the warm object.

Differentiated Instruction

Challenge The statement that thermal energy can be made to flow from the cool refrigerator to the warm room only if work is done is one way to state the second law of thermodynamics. Have students find out who first stated the second law of thermodynamics and how he stated it. Have students write a brief report. **The second law of thermodynamics**

was first stated by Rudolph Clausius and Lord Kelvin and was based on work done by Sadi Carnot. Clausius' version of the second law says it is impossible for any self-acting machine unaided by external agency to convey heat from a body at one temperature to another at a higher temperature. **L2** **IS**

Linguistic

Converting Thermal Energy to Work

If you give a book sitting on a table a push, the book slides for a while and then stops. Friction between the book and the table converts all of the work you did on the book into thermal energy. Is it possible to convert thermal energy completely into work? Even though this process wouldn't violate the first law of thermodynamics, it violates the second law of thermodynamics. No device or process can convert thermal energy completely into work.

Heat Engines A device that converts thermal energy into work is called a heat engine. A car's engine is a heat engine. It converts some of the thermal energy produced by burning fuel into work that causes the car to move. However, only about 25 percent of the thermal energy in the burning fuel is converted into work. The rest of the thermal energy is transferred to the air surrounding the engine. When thermal energy is converted into work, some thermal energy always is transferred to the surroundings.

Internal Combustion Engines The heat engine in a car is an internal combustion engine, in which fuel is burned inside the engine in chambers or cylinders. Each cylinder contains a piston that moves up and down. Each up or down movement of the piston is called a stroke. Automobile and diesel engines make four different strokes, as shown in **Figure 21**.

Figure 21 The up-and-down movement of a piston in an automobile engine consists of four separate strokes. The four strokes form a cycle that is repeated many times each second by each piston.

Fun Fact

In engines with several cylinders, the piston in each cylinder goes through a four-stroke cycle. However, at any given time, the pistons in the various cylinders are in different positions.

Discussion

Types of Engines Would you prefer to own a car with a four-cylinder, six-cylinder, or eight-cylinder engine? Why? *Answers will vary and may include concerns about fuel use, acceleration, and power going uphill.* **L2** **LS** Logical-Mathematical

Activity

Invention's Impact Have students write short paragraphs in their Science Journals about the impact of the internal combustion engine on everyday life. Afterward, have the class generate a list of all the applications of this technology they wrote about. The list could include cars, tractors, lawn mowers, cement trucks, moving vans, and airplanes. **L2** **LS** Linguistic

Visual Learning

Figure 21 Read aloud the descriptions of each of the cycles in a four-cycle engine. Ask students to trace on the diagram each process as you read it. **L2** **LS** Auditory-Musical

Fun Fact

The maximum efficiency possible for any heat engine is called the ideal efficiency and depends only on the highest and lowest temperatures in the engine cycle. The ideal efficiency of a four-cycle gasoline engine, such as those used in cars, is between 40 and 50%. This means that regardless of the engine's design, it can never be more efficient than this.

Teacher FYI

Blood Flow To regulate body temperature, blood flow to the skin is automatically adjusted. When the environment is too cold, blood is drawn away from the skin and sent to more vital organs. When the environment is hot, more blood is sent to the skin so that its thermal energy can be exchanged with the environment.

Make a Model

Heat Pumps Have students work in small groups to look up heat pumps and then draw two diagrams: one showing how a heat pump cools during warm weather, and the second showing how a heat pump warms during cool weather. [L2] [LS]

Visual-Spatial COOP LEARN

Reading Strategy

Sequence Have students read the passage Refrigerators and then write the sequence of coolant flowing through the parts of a refrigerator. Tell students that sequenced text sometimes has signal words, such as *first*, *second*, *third*, *next*, *then*, and *finally*. Have students write the steps of the cooling cycle using appropriate sequencing words.

Figure 22 A refrigerator does work on the coolant in order to transfer thermal energy from inside the refrigerator to the warmer air outside. Work is done when the compressor compresses the coolant, causing its temperature to increase.

Moving Thermal Energy

How do refrigerators stay cold? The second law of thermodynamics prevents thermal energy from spontaneously flowing from inside the refrigerator to the warmer room. However, the second law of thermodynamics allows thermal energy to be moved from a cold area to a warmer area if work is done in the process. A refrigerator does work as it moves thermal energy from inside the refrigerator to the warmer room. The energy to do the work comes from the electrical energy the refrigerator obtains from an electric outlet.

Refrigerators A refrigerator contains a coolant that is pumped through pipes in the refrigerator. The coolant is a special substance that evaporates at a low temperature. **Figure 22** shows how a refrigerator operates. Liquid coolant is

pumped through an expansion valve and changes into a gas. When the coolant changes to a gas, it cools. The cold gas is pumped through pipes inside the refrigerator. The coolant absorbs thermal energy and the inside of the refrigerator cools.

The gas then is pumped to a compressor that does work by compressing the gas. This makes the coolant gas warmer than the room. The warm gas then flows through condenser coils. There thermal energy flows from the gas to the air in the room. Some of this thermal energy is the thermal energy the coolant gas absorbed from inside the refrigerator. As the gas gives off thermal energy, it cools and changes into a liquid. Then liquid coolant is changed back into a gas, and the cycle is repeated.

Entropy

According to the laws of thermodynamics, work can be converted completely into thermal energy, but thermal energy can't be converted completely into work. What prevents thermal energy from being converted completely into work? The answer has to do with entropy. **Entropy** is a measure of how spread out, or dispersed, energy is. Entropy increases when energy becomes more spread out and less concentrated. Converting thermal energy completely into work causes energy to become less spread out and more concentrated. As a result, entropy decreases.

Differentiated Instruction

English-Language Learners To help students understand the refrigeration cycle, have them construct a simple diagram or schematic of the process. Students should identify where heat transfers occur. [L2] [ELL] [LS] **Visual-Spatial**

Post Reading

Cooperative Groups Have students form groups of four or five. Ask for volunteers who feel they understand the Internal Combustion Engines passage to lead their group in a discussion or explanation of the internal combustion engine. Ask them to talk about why some cars have four, six or eight cylinders.

Entropy Always Increases All events that occur, such as the production of work in an automobile engine, must obey the entropy principle. According to the entropy principle, all events that occur cause the entropy of the universe to increase. This means that all events cause energy to spread out and become less concentrated. **Figure 23** shows how the potential energy stored in a ball becomes less concentrated when the ball is dropped and hits the ground.

How does an automobile engine cause entropy to increase? The energy source in an automobile engine is the chemical potential energy concentrated in the gasoline in the fuel tank. When gasoline is burned in the cylinders, 75 percent of the thermal energy produced is not converted into work, but spreads out into the air surrounding the car. Because energy becomes more spread out, entropy increases. However, the energy that becomes spread out is no longer useable. Any event that occurs causes the amount of useable energy to decrease.

Figure 23 When the ball hits the ground, the potential energy it initially had is converted into thermal energy. This thermal energy spreads out and becomes less concentrated. This causes entropy to increase.

3 Assess

DAILY INTERVENTION

Check for Understanding

Logical-Mathematical Have students work in small groups to think of as many ways as they can to keep a house warmer in the winter and then categorize those ways according to energy source. **L2** **LS** **COOP LEARN**

Reteach

Four-Stroke Engine Have students make flash cards with the names of the strokes of the four-stroke cycle of an internal combustion engine. On the reverse side of the card, have them write descriptions of that stroke. Partners can then test each other by shuffling the cards and sequencing them by both name and description. **L2**

LS **Linguistic** **COOP LEARN**

Assessment

Portfolio Have students make posters or drawings showing thermal energy flow in any of the heating or cooling systems or engines studied. Some may be simpler than others, but all should show areas of high and low temperature and direction of thermal energy flow. Use **Performance Assessment in the Science Classroom**, p. 177.

L2 **LS** **Visual-Spatial**

section 4 review

Summary

Heating Systems

- A forced-air heating system uses a fan to force air heated by a furnace through a system of ducts.
- Heating systems transfer thermal energy to rooms by conduction and convection.

Thermodynamics

- The first law of thermodynamics states that the increase in thermal energy of a system equals the work done on the system plus the thermal energy added to the system.
- One way to state the second law of thermodynamics is that thermal energy will not flow from a hot to a cold object unless work is done.

Converting Thermal Energy to Work

- The second law of thermodynamics states that thermal energy cannot be converted completely into work.
- Entropy is a measure of how spread out or dispersed energy is. Entropy increases when thermal energy is produced in an energy transformation.
- According to the entropy principle, all events that occur cause the entropy of the universe to increase. As a result, the amount of usable energy decreases.

Self Check

1. **Explain** how the thermal energy of a closed system changes with time.
2. **Compare and contrast** a forced-air heating system with a radiator system.
3. **Explain** whether or not a heat engine could be made 100 percent efficient by eliminating friction.
4. **Explain** Use the entropy principle to explain why thermal energy can never be converted completely into work.
5. **Think Critically** Suppose you vigorously shake a bottle of fruit juice. Predict how the temperature of the juice will change. Explain your reasoning.

Applying Math

6. **Calculate Change in Thermal Energy** You push down on the handle of a bicycle pump with a force of 20 N. The handle moves 0.3 m, and the pump does not absorb or release any thermal energy. What is the change in thermal energy of the bicycle pump as a result of the work you did on it?
7. **Calculate Work** The thermal energy released when a gallon of gasoline is burned in a car's engine is 140 million J. If the engine is 25 percent efficient, how much work does it do when one gallon of gasoline is burned?

section 4 review

1. In a closed system, no thermal energy flows across the boundary and no work is done across the boundary. The thermal energy stays constant.
2. Both systems rely on fuel as the source of energy. In a forced air system, the burning fuel heats the air directly which is then blown to the

areas to be heated. In a radiator system, the fuel heats water that is pumped to the heated areas, which then heats the air in the room.

3. The second law of thermodynamics states that it is impossible to build a device that is 100% efficient. Increasing the temperature of the

burning gases can increase the efficiency, but the engine will never be 100% efficient.

4. Complete conversion of thermal energy to work would concentrate energy rather than spreading it out, a violation of the fact that entropy, or the diffuseness of

energy, always increases.

5. The temperature of the juice will increase because you do work on the juice as you shake it.
6. $W = Fd = (20 \text{ N})(0.3 \text{ m}) = 6 \text{ N m} = 6 \text{ J}$
7. $(0.25)(140,000,000 \text{ J}) = 35,000,000 \text{ J}$

 Video Lab available for this Lab.

Real-World Problem

Purpose Students will observe how thermal energy is transferred by conduction in liquids and gases   **Kinesthetic**

Process Skills collect data, measure, make and use tables, record data, make and use graphs, interpret data

Time Required 80 minutes

Alternate Materials The knife used for cutting the foam cup should have a thin blade. A kitchen paring knife works well, but scissors are an acceptable substitute.

Safety Precautions Students should be careful while handling hot liquids. Caution them to use care while cutting with the knife. Number the knives and collect them before the end of class.

Procedure

Teaching Strategies

- Have students work in small groups for this lab. Two students can call out the temperature readings as another student records them.
- Remind students that thermal energy transfer by conduction occurs by touch. The particles have to touch in order for conduction to occur.

LAB

Goals

- **Measure** temperature changes in air near a heat source.
- **Observe** conduction of heat in air.

Materials

thermometers (3)
foam cups (2)
400-mL beakers (2)
burner or hot plate
paring knife
thermal mitts (2)

Safety Precautions

WARNING: Use care when handling hot water. Pour hot water using both hands.

Conduction in Gases

Real-World Problem

Does smog occur where you live? If so, you may have experienced a temperature inversion. Usually the Sun warms the ground and the air above it. When the air near the ground is warmer than the air above, convection occurs. This convection also carries smoke and other gases emitted by cars, chimneys, and smokestacks upward into the atmosphere. If the air near the ground is colder than the air above, convection does not occur. Then smoke and other pollutants can be trapped near the ground, sometimes forming smog. How do the insulating properties of air cause a temperature inversion to occur?

Procedure

1. Using the paring knife, carefully cut the bottom from one foam cup.
2. Use a pencil or pen to poke holes about 2 cm from the top and bottom of each foam cup, as shown in the photo.
3. Turn both cups upside down, and poke the ends of the thermometers through the upper holes and lower holes, so both thermometers are supported horizontally. The bulb end of each thermometer should extend into the middle of the bottomless cup.

Alternative Inquiry Lab

Weather Research To extend this lab into an Inquiry Lab, have students research the effects of convection of energy on weather patterns. Topics to research may include explaining typical local weather patterns, tornados, hurricanes, Chinook winds, trade winds, ocean currents, weather in relation to geographic features (such as moun-

tains or plains), the ocean's effect on weather, hail storms, cloud formations, or any other suitable topic. Have students explain the phenomenon using an experiment, poster, model, or computer-generated presentation and written or oral descriptions.

Using Scientific Methods

- Heat about 350 mL of water to about 80°C in one of the beakers.
- Place an empty 400-mL beaker on top of the bottomless cup. Record the temperatures of the two thermometers in a data table like the one shown here.
- Add about 100 mL of hot water to the empty beaker. After one minute, record the temperatures of the thermometers in your data table.
- Continue to record the temperatures every minute for 10 min. Add hot water as needed to keep the temperature of the water at about 80°C.

Air Temperatures in Foam Cup

Time (min)	Upper Thermometer (°C)	Lower Thermometer (°C)
0		
1		
2	Measured temperatures will vary.	
3		
4		
5		

Analyze Your Data

- Graph** the temperatures measured by the upper and lower thermometers on the same graph. Make the vertical axis the temperature and the horizontal axis the time.
- Calculate** the total temperature change for each thermometer by subtracting the initial temperature from the final temperature.
- Calculate** the average rate of temperature change for each thermometer by dividing the total temperature change by 10 min.

Conclude and Apply

- Explain** whether convection can occur in the foam cup if it's being heated from the top.
- Describe** how heat was transferred through the air in the foam cup.
- Explain** why the average rates of temperature change were different for the two thermometers.

Communicating Your Data

Compare your results with other students in your class. **Identify** the factors that caused the average rate of temperature change to be different for different groups.

LAB 279

Assessment

Oral Ask students to use the kinetic theory to explain why thermal energy transfers in the following order: from fastest to slowest solids, liquids, and gases. Use **Performance Assessment in the Science Classroom**, p. 143.

Communicating Your Data

Have students compare results with other groups and discuss differences noted. Why might these differences have occurred?

Analyze Your Data

Expected Outcome The heat source is at the top of the container. Thermal energy transfer by convection cannot occur, therefore the thermal energy transfer must occur by conduction.

Answers to Questions

- Check students' graphs.
- Answers will vary. Check students' work.
- Answers will vary. Check students' work.

Error Analysis Have each group compare its results with those of another group. If the data disagree, have students list reasons for the discrepancy.

Conclude and Apply

- No; if the cup is heated from the top, the air at the top becomes warmer and less dense than the air below. As a result, this air does not sink and transfer thermal energy to the cooler air below.
- Because convection could not occur, thermal energy was transferred by conduction in the air.
- The thermometer at the top was closer to the hot water, so it took less time for thermal energy to be transferred to the air around it. Thermal energy had to be transferred by conduction to the lower thermometer. Because thermal energy moves slowly through air, it took more time for thermal energy to reach this thermometer and the temperature change of this thermometer occurred more slowly.

Content Background

The energy in the Sun is generated by the fusion of hydrogen atoms to form helium. Since the Sun is composed primarily of hydrogen atoms, the fuel for this reaction is readily available. The energy radiated from the Sun provides Earth with an environment that can support life as we know it. The Sun provides energy for photosynthesis to occur, which provides a food source for many organisms. It provides thermal energy, which combined with our atmosphere and water sources, provides a moderate temperature range that supports life. Despite all of these uses of solar energy, a large portion of the energy that arrives on Earth's surface is not used. Scientists are developing technology to enable people to use more of the Sun's energy.

Activity

Solar Energy Have students research the various ways people use solar energy. Students should make oral presentations to share their information with their class.

L2 AS Auditory-Musical

Differentiated Instruction

Challenge Solar energy from the Sun travels at a speed of 299,274 km/s. Express this number in scientific notation using three significant digits. 3.00×10^5 km/s Express this number in m/s using three significant digits and scientific notation. 3.00×10^8 m/s **L3**

Surprising Thermal Energy

Did you know...

... **The average amount of solar energy** that reaches the United States each year is about 600 times greater than the nation's annual energy demands.

... **When a space shuttle reenters** Earth's atmosphere at more than 28,000 km/h, its outer surface is heated by friction to nearly 1,650°C. This temperature is high enough to melt steel.

... **A lightning bolt heats the air** in its path to temperatures of about 25,000°C. That's about 4 times hotter than the average temperature on the surface of the Sun.

Applying Math

1. The highest recorded temperature on Earth is 58°C and the lowest is -89°C. What is the range between the highest and lowest recorded temperatures?
2. What is the average temperature of the surface of the Sun? Draw a bar graph comparing the temperature of a lightning bolt to the temperature of the surface of the Sun.
3. The Sun is almost 150 million km from Earth. How long does it take solar energy to reach Earth if the energy travels at 300,000 km/s?

280 CHAPTER 9 Heat and States of Matter

Applying Math

Teaching Strategies

- Review with students how to find range for question 1.
- Discuss which units should be used to mark the y-axis on the bar graph for question 2.
- Provide graph paper to assist the students with question 2.

Answers

1. 147°C **MA.E.1.4.2**
2. 6,250°C; Check students' graphs. **MA.E.1.4.1**
3. 500 s = 8 min, 20 s **MA.B.1.4.2**

Reviewing Main Ideas

Section 1 Temperature and Thermal Energy

1. According to the kinetic theory, all matter is made of constantly moving particles that collide without losing energy.
2. The temperature of a material is a measure of the average kinetic energy of the particles in the material.
3. The thermal energy of an object is the total kinetic and potential energies of the particles in the object.
4. Heat is thermal energy that flows from a higher to a lower temperature.
5. The specific heat is the amount of energy needed to raise the temperature of 1 kg of a substance by 1°C.

Section 2 States of Matter

1. The states of matter are solid, liquid, gas, and plasma.
2. Changes of state can be interpreted in terms of the kinetic theory of matter.
3. Most matter expands when heated and contracts when cooled. An expansion joint allows concrete to expand and contract without damage.

Section 3 Transferring Thermal Energy

1. Conduction occurs when thermal energy is transferred by collisions between particles. Matter is not transferred.

2. Convection occurs in a fluid as warmer and cooler fluid move from place to place.
3. Radiation is the transfer of energy by electromagnetic waves. Radiation can transfer energy through empty space.
4. Thermal energy flows more quickly in materials that are conductors than in insulators.
5. Some insulating materials contain pockets of air that reduce the flow of thermal energy.

Section 4 Using Thermal Energy

1. According to the first law of thermodynamics, the increase in the thermal energy of a system equals the work done and the amount of thermal energy added to the system.
2. The second law of thermodynamics states that thermal energy cannot flow from a colder to a hotter temperature unless work is done.
3. Any event that occurs decreases the amount of usable energy and increases the entropy of the universe.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review thermal energy.

Reviewing Main Ideas

Assessment

Assessment Transparency Thermal Energy Chapter 9

Directions: Carefully review the diagram and answer the following questions.

1. Which hypothesis is probably being tested by this experiment?
 A. Different metals conduct heat at different rates.
 B. Brass conducts heat better than any other metal.
 C. Metals are good insulators.
 D. Different kinds of wax melt at different rates.
2. According to the diagram, which metal conducts heat BEST?
 F. Aluminum
 G. Nickel
 H. Iron
 I. Copper
3. Most metals will have all of the following properties EXCEPT _____.
 A. shiny luster
 B. good conductor of heat
 C. solid at room temperature
 D. good insulators

L2

FOLDABLES Have students use their Foldables to review the content of the chapter. On the back of the paper, have students write a paragraph comparing and contrasting temperature and thermal energy.

Complete each statement using a word or phrase from the vocabulary list above.

1. Thermal energy that is transferred from warmer to cooler materials is _____.
2. _____ is a measure of the average kinetic energy of the particles in a material.
3. The energy required to raise the temperature of 1 kg of a material 1°C is a material's _____.
4. In _____, thermal energy is transferred by the collisions between particles, not by the transfer of matter.
5. _____ is the theory used to explain the behavior of particles in matter.
6. The transfer of energy by electromagnetic waves is _____.

Checking Concepts

Choose the word or phrase that best answers the question.

7. Which is NOT a method of heat transfer?
A) conduction C) radiation
B) convection D) specific heat
8. Which state of matter is made of electrically charged particles?
A) gas C) plasma
B) liquid D) solid

9. During which phase of a four-stroke engine are waste gases removed?
A) combustion stroke
B) exhaust stroke
C) intake stroke
D) power stroke

Use the table below to answer question 10.

Latent Heats

Substance	Heat of Fusion (J/g)	Heat of Vaporization (J/g)
Ethanol	109	838
Water	334	2,258
Aluminum	397	10,900
Propane	61	387

10. Which material would require the least amount of energy to change 1 kg from a solid to a liquid?
A) aluminum C) propane
B) ethanol D) water
11. Which of the following is a measure of the average kinetic energy of the particles in an object?
A) potential energy
B) specific heat
C) temperature
D) thermal energy
12. Which of these is NOT used to calculate change in thermal energy?
A) mass
B) specific heat
C) temperature change
D) volume
13. Which of the following processes does NOT require the presence of particles of matter?
A) combustion
B) conduction
C) convection
D) radiation

Thinking Critically

17. It would not cool the kitchen. The thermal energy from the kitchen that is transferred to the refrigerator coolant would be transferred back to the kitchen from the condenser coils.
18. Thermal energy is the sum of the kinetic and potential energy of the water molecules. Doubling the amount of water will double the amount of thermal energy.
19. It is not true. The increase in thermal energy may increase the potential energy so that the temperature remains unchanged.
20. If the water is heated from the top, conduction will occur instead of convection. The warm water on the top is less dense than the cooler water below and will not sink.
21. Thermal energy transferred from the warm object to the coolant in the refrigerator, coolant is compressed and the temperature rises, thermal energy transferred from the warm coolant to the outside air, the coolant expands as it passes through expansion valve and cools.

Applying Math

Math Standards

National: 2, 9

Florida: MA.B.1.4.2

22. $Q = m(T_{\text{final}} - T_{\text{initial}})C$
 $= (4.0 \text{ kg})(50^\circ\text{C})(4,184 \text{ J/kg}^\circ\text{C})$
 $= 836,800 \text{ J}$
23. increases by 14.9°C
24. $1,673 \text{ J} = m(2^\circ\text{C})(4,184 \text{ J/kg}^\circ\text{C})$
 $m = 0.20 \text{ kg}$

14. Which of the following is the name for thermal energy that is transferred only from a higher temperature to a lower temperature?
 A) heat C) potential energy
 B) kinetic energy D) solar energy
15. According to the entropy principle, any event that occurs in the universe must cause which of the following to happen?
 A) energy to become more concentrated
 B) energy to become less concentrated
 C) total amount of energy to increase
 D) total amount of energy to decrease
19. Explain whether or not the following statement is true: If the thermal energy of an object increases, the temperature of the object must also increase.
20. Predict Suppose a beaker of water is heated from the top. Explain which is more likely to occur in the water—thermal energy transfer by conduction or convection.
21. Classify Order the events that occur in the removal of thermal energy from an object by a refrigerator. Draw the complete cycle, from the placing of a warm object in the refrigerator to the changes in the coolant.

Interpreting Graphics

16. Copy and complete this concept map.

Thinking Critically

17. Explain On a hot day a friend suggests that you can make your kitchen cooler by leaving the refrigerator door open. Explain whether leaving the refrigerator door open would cause the air temperature in the kitchen to decrease.
18. Explain Which has the greater amount of thermal energy, one liter of water at 50°C or two liters of water at 50°C ?

Applying Math

Use the table below to answer questions 22 to 24.

Specific Heat of Materials

Material	Specific Heat (J/kg $^\circ\text{C}$)
Water	4,184
Copper	385
Silver	235
Graphite	710
Iron	450

22. Calculate Thermal Energy How much thermal energy is needed to raise the temperature of 4.0 kg of water from 25°C to 75°C ?
23. Calculate Temperature Change How does the temperature of 33.0 g of graphite change when it absorbs 350 J of thermal energy?
24. Calculate Mass A certain mass of water gains 1,673 J of thermal energy when its temperature increases by 2.0°C . What is the mass of the water?

6. A

Record your answers on the answer sheet provided by your teacher or on a sheet of paper.
The assessed Florida Benchmark appears above the question.

SCA.1.4.3

3. Which is the term for the amount of energy required for 1 kg of a liquid at its boiling point to become a gas?

- A. heat of vaporization
- B. diffusion
- C. heat of fusion
- D. thermal energy

Use the table below to answer questions 4 and 5.

Material	Specific Heat [J/(kg °C)]
Copper	385
Gold	449
Lead	129
Tin	228
Zinc	388

4. According to the table above, a 2-kg block of which of the following materials would require 898 J of heat to increase its temperature by 1°C?

- A. gold
- B. lead
- C. tin
- D. zinc

5. Which of the following materials would require the most heat to raise a 5-kg sample of the material from 10°C to 50°C?

- A. gold
- B. lead
- C. tin
- D. zinc

Multiple Choice

Use the graph below to answer questions 1 and 2.

SCA.1.4.3

1. At which points on the graph is the average kinetic energy of the water molecules increasing?

- A. F and G
- B. G and K
- C. F and H
- D. H and K

SC.B.1.4.3

2. At which points on the graph is the potential energy of the water molecules increasing, but the average kinetic energy is not?

- A. F and G
- B. G and K
- C. F and H
- D. H and K

Test-Taking Tip

Read Carefully Read all choices before answering the question.

Use the figure below to answer question 6.

6. The illustration above shows the particles in a material being heated at one end. Thermal energy is transferred from the warmer part of the material to the cooler part. What heat transfer process is occurring in the material?

- A. conduction
- B. convection
- C. radiation
- D. entropy

Gridded Response

7. The temperature of a 24.5-g block of aluminum decreases from 30.0°C to 21.5°C . If aluminum has a specific heat of $897 \text{ J}/(\text{kg } ^{\circ}\text{C})$, what is the change in thermal energy, measured in joules, of the block of aluminum?
8. The difference between the boiling point and the freezing point of potassium is 695.72 K . What is this difference in degrees on the Celsius temperature scale?

Short Response

SC.B.1.4.3

9. Explain how the temperature and thermal energy of an object are related.
10. What property of water makes it useful as a coolant?

Extended Response

Use the figure below to answer question 11.

11. The figure shows a calorimeter that is used to measure the specific heat of materials.

PART A Explain why it is necessary to measure the temperature change of the water when using a calorimeter to measure the specific heat of a material.

PART B Explain why the calorimeter must be insulated from its surroundings.

12. Explain how changes in a fluid's density enable convection currents to occur.

Gridded Response

7. $Q = (0.0245 \text{ kg}) (21.5^{\circ}\text{C} - 30.0^{\circ}\text{C}) (897 \text{ J}/(\text{kg } ^{\circ}\text{C})) = -187 \text{ J}$
8. 695.72

Short Response

9. Temperature is a measure of the average kinetic energy of particles in a substance. Thermal energy is the combined kinetic and potential energies due to the random motion of the particles in a substance.
10. It has a high specific heat, meaning it can absorb thermal energy without a large change in temperature.

Extended Response

11. **Part A:** Measuring the temperature change and mass of the water allows the calculation of the amount of thermal energy transferred between the sample and the water. The thermal energy transferred to the water equals the thermal energy transferred from the sample.

Part B: Insulating the calorimeter minimizes the thermal energy lost to the surrounding air. Lost thermal energy would lower the measured temperature change in the water and lead to a low value for the sample's specific heat.

12. Convection is the transfer of energy in a fluid by the movement of the heated particles. When a fluid is heated, the particles move faster. As the particles move faster, they tend to be farther apart. The fluid expands as its temperature increases. The volume of the fluid increases, but its mass remains unchanged. The result is that the density of the fluid decreases. Convection occurs when the warmer, less-dense fluid rises above the cooler, denser fluid. This fluid then cools and sinks when it becomes denser than the surrounding fluid.

Transparencies

Section Focus

Section Focus
Transparency

How many waves can you pick out in this scene? Is light described as a wave? If you were there when this photograph was taken, you might also mention sound waves.

1. Describe the different waves in this picture.
2. If you are swimming underwater, can you still hear the noises around you? What does this tell you about sound waves?
3. What does light travel through as it goes from the Sun to the eyes of a underwater swimmer?

12

Section Focus Big Fiddle, Little Fiddle

Have you ever heard the instruments below played? If you have, you probably noticed that the bass produces a much lower sound than the violin. The difference in the sounds is related to differences in the waves each instrument produces.

1. Name some musical instruments. How are the instruments you named played?
- * A cello is bigger than a violin but smaller than a bass. How do you think the sound made by a cello compares to the sounds made by a violin and a bass?

L2

Section Focus **Wave Art**

This artistic picture shows how waves can make fascinating patterns in water. When waves travelling toward the wall reach the openings, they pass through them. After passing through the openings, the waves create new patterns as they overlap on the other side of the wall.

- 1 What do the waves look like before they reach the wall? What do they look like after passing through the opening?
- 2 Where do the waves of light reach the wall?
- 3 What do you think this picture would look like if both holes were plugged?

1

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.
- COOP LEARN** Cooperative Learning activities are designed for small group work.
- LS** Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.
- P** These strategies represent student products that can be placed into a best-work portfolio.
- PBL** Problem-Based Learning activities apply real-world situations to learning.

Assessment

Assessment Waves

Type of wave	Shortest wavelength (cm)	Longest wavelength (cm)
Radio waves	1	10 000 000
Microwaves	1	100
Red light	0.00063	0.00076
Green light	0.00049	0.00056
Blue light	0.00045	0.00044
X-rays	0.000000001	0.0000001

- Electromagnetic waves of different wavelengths have been given different names. According to the table, which type of electromagnetic wave can have a wavelength greater than 1 m?
- | | |
|---------------|--------------|
| A Radio waves | C Red light |
| B Microwaves | D Blue light |
- According to the table, which type of electromagnetic wave can have a wavelength of 0.000001 m?
- | | |
|---------------|--------------|
| A Radio waves | B Red light |
| C Microwaves | D Blue light |
- If a source was emitting an electromagnetic wave of 0.00000001 m, what kind of device would it be?
- | | |
|------------------|-----------------|
| A Radio | C Flashlight |
| B Microwave oven | D X-ray machine |

Reading Essentials

Waves

Lesson 1 • The Nature of Waves

Duration: 45 min

What You'll Learn...

- Describe the difference between transverse and longitudinal waves.
- Explain how waves transfer energy.

What You'll Do...

- Observe the motion of a rope as a transverse wave travels along it.
- Observe the motion of a spring as a longitudinal wave travels along it.

What You'll Discover...

- The difference between transverse and longitudinal waves.
- How waves transfer energy.

Materials

Read and Say Something
Students will read and say something about the difference between transverse and longitudinal waves.

Activities

- **Transverse and Longitudinal Waves**
Students will observe the motion of a rope as a transverse wave travels along it and the motion of a spring as a longitudinal wave travels along it.

Assessment

- **Read and Say Something**
Students will read and say something about the difference between transverse and longitudinal waves.

Resources

- **Transverse and Longitudinal Waves**
Students will observe the motion of a rope as a transverse wave travels along it and the motion of a spring as a longitudinal wave travels along it.

Extensions

- **Transverse and Longitudinal Waves**
Students will observe the motion of a rope as a transverse wave travels along it and the motion of a spring as a longitudinal wave travels along it.

Reflection

- **Transverse and Longitudinal Waves**
Students will observe the motion of a rope as a transverse wave travels along it and the motion of a spring as a longitudinal wave travels along it.

• Before You Read

- Write about what you think a wave is and how many types of waves there are.
- Read and say something about the difference between transverse and longitudinal waves.

• Read to Learn

• What is a wave?

Imagine that you are watching a train chugging on a track. The train is moving to the right, and you are standing on the ground. As the train moves, the wheels on the tracks are moving up and down. This is a wave. The wave is moving to the right, and the wheels are moving up and down. The wave is a disturbance that travels through a medium. The medium is the material that the wave is traveling through. The wave is a disturbance that travels through a medium. The medium is the material that the wave is traveling through.

There are two types of waves: transverse waves and longitudinal waves. Transverse waves are waves in which the particles of the medium move perpendicular to the direction of the wave. Longitudinal waves are waves in which the particles of the medium move parallel to the direction of the wave. Transverse waves are waves in which the particles of the medium move perpendicular to the direction of the wave. Longitudinal waves are waves in which the particles of the medium move parallel to the direction of the wave.

Waves transfer energy. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another.

Waves and Energy

Waves transfer energy. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another. The energy is transferred from one place to another.

16-2 CHAPTER 16

Chapter Tests

Notes	Chapter	Waves	Date
	Test		
I. Testing Concepts			
Questions: Answer the above using the terms below. Some terms may be used.			
	transverse	reflected	compressional
refraction	transverse wave	amplitude	compressional wave
wavelength	interference	sonic wave	standing wave
crest	wave speed	node	resonance
1. In a transverse wave, the _____ is the _____.			
2. Aiding wave, a reflection of the wave is of an object or object.			
3. The number of waves that pass a point in _____			
the _____			
4. The _____ of a transverse wave is its highest point.			
5. In a longitudinal wave, the distance from one trough to _____			
the next is a _____			
6. When the wave is set in a pond with _____, the wavelength _____			
7. When waves reflect, an object is _____.			
8. _____ is the _____ of a wave as it passes a point.			
9. A compressional wave _____ the particles of the _____ it travels through.			
10. A transverse wave _____ the particles of the _____ it travels through.			
11. _____ is a transverse disturbance that carries energy if it _____			
12. _____ because of a change in _____			
13. When the _____ is a regular back and forth _____			
14. _____ is a repeating disturbance that carries energy.			
15. _____ is a disturbance that travels through a medium _____			
16. A wave of _____ is the repeating disturbance that carries energy.

L2

Science Content Background

section 1 The Nature of Waves

What's in a wave?

From radio waves to light waves to sound waves, we are immersed in a world of waves.

Waves transfer energy from one place to another. Mechanical waves such as sound and water need a medium to travel through. These waves create disturbances in the medium as they travel. The particles of the medium, however, do not move with the wave as it travels.

Waves can be transverse waves or compressional waves. In a transverse wave, the particles in the medium are displaced perpendicular to the direction of the wave motion. In a compressional wave, the particles move back and forth in the same direction as the wave moves. Transverse waves cannot travel through fluids. Earthquakes produce both transverse waves (S waves) and compressional waves (P waves).

section 2 Wave Properties

Wavelength

A great deal of variation exists in the wavelengths of electromagnetic waves. Electromagnetic waves with wavelengths greater than about 1 mm are radio waves. These waves have the longest wavelengths. Light wavelengths range from about 400 to 700 nanometers. One nanometer is 0.000000001 m or 10^{-9} m.

Frequency

Frequency and period are related. Frequency is how often something happens in a given time. Period is the time for something to happen. Thus for a wave, frequency is equal to the reciprocal of the period. Frequency is expressed as cycles per second, and period is seconds per cycle.

Amplitude and Energy

The amplitude of a wave is the maximum displacement of the particles in the medium from their resting position. Attractive forces between the particles in the medium act like springs that pull the particles back to their original position when the wave passes.

The energy transferred by a wave is proportional to the square of the amplitude. Thus, higher ocean waves produce more damage. Doubling the height of the wave makes the energy transferred four times greater.

section 3 The Behavior of Waves

Refraction and Diffraction

Waves do not always travel in a straight line. Refraction and diffraction cause waves to change direction. Refraction occurs when waves change speed as they pass from one material into another. Diffraction occurs when a wave strikes an obstacle or an opening.

Waves in the Ocean and Atmosphere: Introduction to Wave Dynamics, by Joseph Pedlosky, Springer Verlag, 2003

Wave Motion, by J. Billingham and A.C. King, Cambridge University Press, 2001

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that . . .

When a wave travels through a medium, particles of the medium travel along with the wave.

Students have probably seen water waves hit land and flow up the beach. They may even have felt the force of an ocean wave pushing them towards the beach. Because these waves encounter the shore, they move differently from normal waves. But they do form lasting impressions. Thus, it is understandable that students would think that the medium travels with the wave.

Demonstration

Draw the figure below on the board. Tell students to imagine a rock is dropped into the water at Point A. Ask students to predict where each of the floating bobs will end up after ten waves go by the bobs.

Promote Understanding

Activity

Students make two models of waves—one that is incorrect and one that is correct.

Model 1 (incorrect): Place on the floor alternating strips of green and red tape 2 m apart so they form the outline of a large circle. Have students walk slowly around the circle. Tell them to duck down when they get to a strip of green tape and to walk on their toes when they get to a strip of red tape. Students move up and down as they walk around the room.

Model 2 (correct): This resembles the “wave” done by fans at sporting events. Have students stand in a circle and not leave their positions. Start the wave by having a student reach up

high, pause, duck down low, pause, and return to normal standing. After the first person rises, the second person rises and does the same thing. Each person in turn passes the wave around the circle.

Ask students to analyze the two models of waves and write which one they think is the better model and why.

Assess

After completing the chapter, see *Identifying Misconceptions* in the Study Guide at the end of the chapter.

Chapter Vocabulary

wave, p. 288
 medium, p. 289
 transverse wave, p. 290
 compressional wave, p. 290
 crest, p. 294
 trough, p. 294
 rarefaction, p. 294
 wavelength, p. 295
 frequency, p. 295
 period, p. 295
 amplitude, p. 298
 refraction, p. 302
 diffraction, p. 304

-  *Virtual Lab What are some characteristics of waves?*

Waves, anyone?

This surfer in Hawaii is surrounded by an ocean wave that forms a huge wall of water. You are surrounded by waves, too. Everything you see or hear is brought to you by waves. Easy to see—like this ocean wave—or invisible, all waves transfer energy.

Science Journal Write down three things you already know about waves and one thing you would like to learn about waves.

Theme Connection

Energy Waves are rhythmic disturbances that transfer energy. As the amplitude of a wave increases, the energy it transfers also increases.

About the Photo

Ocean Waves The area in Hawaii where this photo was taken is known for huge ocean waves. Thousands of miles of open ocean separate this region from the place where the waves originate. Distant storms in the north Pacific supply the energy for gigantic waves that are legendary among surfers.

Start-Up Activities

How do waves transfer energy?

Light enters your eyes and sound strikes your ears, enabling you to sense the world around you. Light and sound are waves that transfer energy from one place to another. Do waves transfer anything else along with their energy? Does a wave transfer matter, too? In this activity, you'll observe one way that waves can transfer energy.

1. Place your textbook flat on your desk. Line up four marbles on the groove at the edge of the textbook so that the marbles are touching each other.
2. Hold the first three marbles in place using three fingers of one hand.
3. Use your other hand to tap the first marble with a pen or pencil.
4. Observe the behavior of the fourth marble.
5. **Think Critically** Write a paragraph explaining how the fourth marble reacted to the pen tap. Draw a diagram showing how energy was transferred through the marbles.

Preview this chapter's content and activities at [Science online](#)

FOLDABLES™ Study Organizer

Types of Waves Make the following Foldable to compare and contrast two types of waves.

- STEP 1** Fold one sheet of paper lengthwise.

- STEP 2** Fold into thirds.

- STEP 3** Unfold and draw overlapping ovals. Cut the top sheet along the folds.

- STEP 4** Label the ovals as shown.

Construct a Venn Diagram As you read this chapter, list properties and characteristics unique to transverse waves under the left tab, those unique to compressional waves under the right tab, and those common to both under the middle tab.

Purpose Use the Launch Lab to illustrate for students energy moving through matter. [L2]

IS Kinesthetic

Preparation Obtain enough marbles of the same size so that each student can have four.

Materials marbles, textbook, pen

Teaching Strategy Instruct students to make sure books are on a flat surface. Make sure students hold the marbles so they are touching one another.

Think Critically

Students should notice that the fourth marble moved even though the first three marbles stayed in place. This shows that energy transferred through the first three marbles, which caused the fourth marble to move without matter being transferred.

Assessment

Performance Have students write short paragraphs explaining what happens if the marbles are held in place without touching each other. After the first marble hits the second marble nothing happens. This is because the energy of the first marble is transferred to the air, which transfers very little energy to the next marble. Use **Performance Assessment in the Science Classroom**, p. 157.

FOLDABLES™ Study Organizer

**Dinah Zike
Study Fold**

L2 ELL

Section Focus Transparency Wave to the Camera

How many waves can you pick out in this scene? Is light described as a wave? If you were there when this photograph was taken, you might also mention sound waves.

- Describe the different waves in this picture.
- If you are swimming underwater, can you still hear the noises around you? What does this tell you about sound waves?
- What does light travel through as it goes from the Sun to the eyes of an underwater swimmer?

L2

Reading Guide

What You'll Learn

- **Recognize** that waves transfer energy but not matter.
- **Define** mechanical waves.
- **Compare and contrast** transverse waves and compressional waves.

Why It's Important

You can see and hear the world around you because of the energy transferred by waves.

Review Vocabulary
energy: the ability to do work

New Vocabulary

- wave
- medium
- transverse wave
- compressional wave

What's in a wave?

A surfer bobs in the ocean waiting for the perfect wave, microwaves warm up your leftover pizza, and sound waves from your CD player bring music to your ears. Do these and other types of waves have anything in common with one another?

A **wave** is a repeating disturbance or movement that transfers energy through matter or space. For example, ocean waves disturb the water and transfer energy through it. During earthquakes, energy is transferred in powerful waves that travel through Earth. Light is a type of wave that can travel through empty space to transfer energy from one place to another, such as from the Sun to Earth.

Figure 1 Falling pebbles transfer their kinetic energy to the particles of water in a pond, forming waves.

Waves and Energy

Kerplow! A pebble falls into a pool of water and ripples form. As **Figure 1** shows, the pebble causes a disturbance that moves outward in the form of a wave. Because it is moving, the falling pebble has energy. As it splashes into the pool, the pebble transfers some of its energy to nearby water molecules, causing them to move. These molecules then pass the energy along to neighboring water molecules, which, in turn, transfer it to their neighbors. The energy moves farther and farther from the source of the disturbance. What you see is energy traveling in the form of a wave on the surface of the water.

Reading Preview

Tie to Prior Knowledge

Energy Review the idea of energy and have students give examples of waves. Emphasize to students that waves transfer energy but not matter.

Structural Analysis Have students look for smaller words within the new vocabulary words. Point out *compress* in the word *compressional* and ask them to brainstorm meanings. Help students make connections by asking how *compress* relates to a household sponge. They may say squeezing a sponge is like compression.

Waves and Matter Imagine that you're in a boat on a lake. Approaching waves bump against your boat, but they don't carry it along with them as they pass. The boat does move up and down and maybe even a short distance back and forth because the waves transfer some of their energy to it. However, after the waves have moved on, the boat is still in nearly the same place. The waves don't even carry the water along with them. Only the energy transferred by the waves moves forward. All waves have this property—they transfer energy without transporting matter from place to place.

✓ Reading Check What do waves transfer?

Making Waves A wave will travel only as long as it has energy to transfer. For example, when you drop a pebble into a puddle, the ripples soon die out and the surface of the water becomes still again.

Suppose you are holding a rope at one end, and you give it a shake. You would create a pulse that would travel along the rope to the other end, and then the rope would be still again, as **Figure 2** shows. Now suppose you shake your end of the rope up and down for a while. You would make a wave that would travel along the rope. When you stop shaking your hand up and down, the rope will be still again. It is the up-and-down motion of your hand that creates the wave.

Anything that moves up and down or back and forth in a rhythmic way is vibrating. The vibrating movement of your hand at the end of the rope created the wave. In fact, all waves are produced by something that vibrates.

Mechanical Waves

Sound waves travel through the air to reach your ears. Ocean waves move through water to reach the shore. In both cases, the matter the waves travel through is called a **medium**. A medium can be a solid, a liquid, a gas, or a combination of these. For sound waves, the medium is air, and for ocean waves, the medium is water. Not all waves need a medium. Some waves, such as light and radio waves, can travel through space. Waves that can travel only through matter are called mechanical waves. The two types of mechanical waves are transverse waves and compressional waves.

Figure 2 A wave will exist only as long as it has energy to transfer. **Explain** what happened to the energy that was transferred by the wave in this rope.

2 Teach

Caption Answer
Figure 2 It was transferred to the end of the rope and then to the surrounding air.

Quick Demo
Wave Motion

Materials table-tennis ball, wide pan of water, small rock

Estimated Time five minutes

Procedure Place the table-tennis ball in the pan about halfway between the center and the edge of the pan. When the water is still, drop the rock into the pan. The ball moves up and down, but not horizontally in the direction in which the wave moves.

L2 **Visual-Spatial**

✓ Reading Check

Answer energy

IDENTIFYING

Misconceptions

Wave Motion Students may think that when a wave travels through a medium, particles of the medium travel along with the wave. See the beginning of this chapter for teaching strategies that address this misconception.

LAB DEMONSTRATION

Purpose to demonstrate the movement of a wave through matter

Materials rope, broom

Preparation Tie the end of a rope to the handle of a broom.

Procedure Rest the broom upright in the corner of the room. Send a wave through the rope.

Expected Outcome Students will see the wave travel through the rope and cause the broom to shake or fall down.

Assessment

Where did the energy that caused the broom to shake or fall come from? **from the hand moving the rope** How did the energy get to the broom? **It traveled along the rope in a wave.** **L2**

Use Science Words

Word Meaning Tell students that the word *transverse* means “acting, lying, or being across; set crosswise.” What makes a transverse wave transverse? **When a transverse wave travels through a medium, the particles of the medium move crosswise to the direction in which the wave moves.** [L2] [IS] **Linguistic**

Activity

Wave Types Have students use a coiled spring toy to make both transverse and compressional waves. Have them compare and contrast how the waves look and the different things they did to make the two different types of waves. [L1] [ELL] [IS] **Kinesthetic**

Teacher FYI

Wave Names Another name for a compressional wave is longitudinal wave. Sound waves are examples of this type of wave.

Caption Answer

Figure 4 Possible answer: sound wave

Figure 3 A water wave travels horizontally as the water moves vertically up and down.

Transverse Waves In a **transverse wave**, matter in the medium moves back and forth at right angles to the direction that the wave travels. For example, **Figure 3** shows how a wave in the ocean moves horizontally, but the water that the wave passes through moves up and down. When you shake one end of a rope while your friend holds the other end, you are making transverse waves. The wave and its energy travel from you to your friend as the rope moves up and down.

Compressional Waves In a **compressional wave**, matter in the medium moves back and forth along the same direction that the wave travels. You can model compressional waves with a coiled-spring toy, as shown in **Figure 4**. Squeeze several coils together at one end of the spring. Then let go of the coils, still holding onto coils at both ends of the spring. A wave will travel along the spring. As the wave moves, it looks as if the whole spring is moving toward one end. Suppose you watched the coil with yarn tied to it, as in **Figure 4**. You would see that the yarn moves back and forth as the wave passes, and then it stops moving after the wave has passed. The wave transfers energy, but not matter, forward along the spring. Compressional waves also are called longitudinal waves.

Sound Waves Sound waves are compressional waves. When a noise is made, such as when a locker door slams shut and vibrates, nearby air molecules are pushed together by the vibrations. The air molecules are squeezed together like the coils in a coiled-spring toy are when you make a compressional wave with it. The compressions travel through the air to make a wave.

Figure 4 In a compressional wave in a coiled-spring toy, the wave travels horizontally along the spring, and the coils in the spring move back and forth horizontally.
Describe another example of a compressional wave.

290 CHAPTER 10 Waves

Differentiated Instruction

Visually Impaired Have each visually impaired student place a hand on a section of a rope or spring toy. Make waves in the rope or spring toy. Ask each student to describe how the section he or she is touching moves. Does it move up or down, backwards or forwards? Does it travel from one place to another? [L1] [ELL] **COOP LEARN** [IS] **Kinesthetic**

Challenge Have students hypothesize how transverse waves will travel in different kinds of ropes. Then, have students test their hypotheses using different ropes. Ask them to write a single summary sentence that describes the relationship between the wave and type of rope used. **Students will find that thick ropes will carry waves, but might require more energy to start wave action than do thin ropes.** [L3]

Sound in Other Materials Sound waves also can travel through other mediums, such as water and wood. Particles in these mediums also are pushed together and move apart as the sound waves travel through them. When a sound wave reaches your ear, it causes your eardrum to vibrate. Your inner ear then sends signals to your brain, and your brain interprets the signals as sound.

✓ Reading Check *How do sound waves travel in solids?*

Water Waves Water waves are not purely transverse waves. The water moves up and down as the waves go by. However, the water also moves a short distance back and forth along the direction the wave is moving. This movement happens because the low part of the wave can be formed only by pushing water forward or backward toward the high part of the wave, as in **Figure 5A**. Then, as the wave passes, the water that was pushed aside moves back to its initial position, as in **Figure 5B**. In fact, if you looked closely, you would see that the combination of this up-and-down and back-and-forth motion causes water to move in circles. Anything floating on the surface of the water absorbs some of the waves' energy and bobs in a circular motion.

Ocean waves are formed most often by wind blowing across the ocean surface. As the wind blows faster and slower, the changing wind speed is like a vibration. The size of the waves that are formed depends on the wind speed, the distance over which the wind blows, and how long the wind blows. **Figure 6** on the next page shows how ocean waves are formed.

Figure 5 A water wave causes water to move back and forth, as well as up and down. Water is pushed back and forth to form the crests and troughs.

A The low point of a water wave is formed when water is pushed aside and up to the high point of the wave.

B The water that is pushed aside returns to its initial position.

✓ Reading Check

Answer Particles in the solid are pushed together and move apart as sound waves travel through them.

Discussion

Beach Breakers Why do waves break where they meet beaches? As waves of water move into the increasingly shallow area near the shore, the particles of water are forced to move in shallower and shallower ellipses. The wave breaks when it hits the ground as it tries to complete its elliptical path. The energy of the wave dissipates as the water moves up the beach and then falls back into the ocean. **L2**

Science Journal

Wave Diary Have students list in their Science Journals the kinds of waves they see in a typical day, classifying each wave as transverse or compressional. Have them identify the effects each wave's energy produces. **L2** **IS** **Linguistic**

Visual Learning

Figure 5 When you throw a stone into the water, how does it start the motion of the wave? **When the stone hits the water, it pushes down on the water.** Why does the wave spread out as it moves? **It spreads because the energy moves in all directions from the point of origin.** **L2** **IS** **Visual-Spatial**

Visualizing Formation of Ocean Waves

Have students examine the pictures and read the captions. Then ask the following questions.

What happens to the surface area of water exposed to the wind as waves build up? **The surface area increases.** How does this affect the waves? **The greater surface area means that there is more contact area between the air and water, providing an increased area to which energy may be transferred.**

Activity

Observe Waves Use a wave tank or large flat pan such as a cake pan partially filled with water to observe waves. Students can blow across the surface or a fan can be provided to simulate the wind. Students should try to duplicate the four types of seas presented. **L2 KS Kinesthetic**

Content Background

Earthquakes produce three types of waves, all of which move out in concentric circles from the focus of the earthquake. Primary waves, known as P waves, are compressional waves that travel deep inside Earth. These waves travel the fastest. Secondary waves, called S waves, are transverse waves that can travel only through solids. They also travel deep inside Earth. Most of the damage from earthquakes is caused by surface waves that spread out from the epicenter, the point on Earth's surface above the focus. Surface waves cause both transverse and compressional movement of the ground.

Figure 6

When wind blows across an ocean, friction between the moving air and the water causes the water to move. As a result, energy is transferred from the wind to the surface of the water. The waves that are produced depend on the length of time and the distance over which the wind blows, as well as the wind speed.

▲ Wind causes ripples to form on the surface of the water. As ripples form, they provide an even larger surface area for the wind to strike, and the ripples increase in size.

▲ Waves that are higher and have longer wavelengths grow faster as the wind continues to blow, but the steepest waves break up, forming whitecaps. The surface is said to be choppy.

▲ The shortest-wavelength waves break up, while the longest-wavelength waves continue to grow. When these waves have reached their maximum height, they form fully developed seas.

▲ After the wind dies down, the waves lose energy and become lower and smoother. These smooth, long-wavelength ocean waves are called swells.

Differentiated Instruction

Challenge Ask students to research the impact to the shoreline when ocean waves repeatedly strike the shore. Have them find what measures are being taken to keep the shoreline unchanged. **L3**

Reading Strategy

Cooperative Learning Scaffold students' understanding of **Figure 6**, Visualizing Formation of Ocean Waves, by allowing students to engage in a discussion. Have one student read the text on ripples and another explain the drawings, adding any prior knowledge about the term. Continue for the text on choppy seas, fully developed seas, and swells.

Figure 7 When Earth's crust shifts or breaks, the energy that is released is transmitted outward, causing an earthquake.

Explain why earthquakes are mechanical waves.

Seismic Waves A guitar string makes a sound when it breaks. The string vibrates for a short time after it breaks and produces sound waves. In a similar way, forces in Earth's crust can cause regions of the crust to shift, bend, or even break. The breaking crust vibrates, creating seismic waves that transfer energy outward, as shown in **Figure 7**. Seismic waves are a combination of compressional and transverse waves. They can travel through Earth and along Earth's surface. When objects on Earth's surface absorb some of the energy transferred by seismic waves, they move and shake. The more the crust moves during an earthquake, the more energy is released.

Scienceonline

Topic: Seismic Waves

Visit fl.gpscience.com for Web links to information about seismic waves.

Activity Write a summary of how seismic waves are used to map Earth's interior.

section 1 review

Summary

Waves and Energy

- A wave is a repeating disturbance or movement that transfers energy through matter or space.
- Waves transfer energy without transporting matter.
- Waves are produced by something that is vibrating.

Mechanical Waves

- Mechanical waves must travel in matter.
- Mechanical waves can be transverse waves or compressional waves.
- In a transverse wave, matter in the medium moves at right angles to the wave motion.
- In a compressional wave, matter in the medium moves back and forth along the direction of the wave motion.

Self Check

1. **Compare and contrast** a transverse wave and a compressional wave. Give an example of each type.
2. **Describe** the motion of a buoy when a water wave passes. Does it move the buoy forward?
3. **Explain** how you could model a compressional wave using a coiled-spring toy.
4. **List** the characteristics of a mechanical wave.
5. **Think Critically** Why do boats need anchors if ocean waves do not carry matter forward?

Applying Math

6. **Calculate Time** The average speed of sound in water is 1,500 m/s. How long would it take a sound wave to travel 9,000 m?

More Section Review fl.gpscience.com

SECTION 1 The Nature of Waves 293

section 1 review

1. Possible answers include that transverse waves move at right angles to the direction the waves travel, while compressional waves move back and forth in the same direction as the waves travel. Water waves are partly transverse waves. Sound waves are compressional waves.
2. A buoy moves up and down when a wave passes. The wave does not move the buoy forward.
3. Pull the ends of the toy apart and anchor them firmly at both ends. Then, squeeze several coils together at one end and release them.
4. Mechanical waves are either transverse or compressional, but always require a medium to travel through.
5. The tide and its related currents will move unanchored boats.
6. 6 s

Caption Answer

Figure 7 Because they require a medium through which to travel.

Post Reading

Extended Research Project

Students may be aware of the tsunami that occurred in the Indian Ocean in December 2004. Have them research news and magazine articles that describe how energy from the underwater earthquake caused the tsunami.

3

Assess

DAILY INTERVENTION

Check for Understanding

Logical-Mathematical With a partner, have each student draw a diagram of both a transverse wave and a compressional wave. Ask them to label peaks and troughs; compressions and rarefactions, as well as the direction of energy transfer for each wave. [L2]

Reteach

Comparing Waves Pair students and give each pair a coiled spring toy. Tie a piece of colored string or yarn around one of the coils. Have students make transverse and then compressional waves in the toy. Ask them to identify what is the same and what is different about the motion of the string with each wave. [L2]

Assessment

Process Have students do research on earthquakes. Have them find out how the waves form and why they form in the places they do. Have students make events chains of their findings. Use PASC, p. 163. [P] [L2]

Tie to Prior Knowledge

Comparing Waves Have students compare common examples of waves and ask them whether they can identify any similarities among all waves. Tell students that they will learn about the different parts of waves and how these parts determine the amount of energy a wave transfers. L2

Preview and Predict Ask students to explain the saying, “A picture is worth a thousand words.” After discussing the meaning of the saying, have volunteers make up definitions for each vocabulary term based on Figures 8 and 9. Remind them to use the illustrations to make sense of text concepts and terms.

Reading Guide

What You'll Learn

- **Define** wavelength, frequency, period, and amplitude.
- **Describe** the relationship between frequency and wavelength.
- **Explain** how a wave's energy and amplitude are related.
- **Calculate** wave speed.

Why It's Important

Waves with different properties can be used in different ways.

Review Vocabulary

vibration: a back and forth movement

New Vocabulary

- crest
- trough
- rarefaction
- wavelength
- frequency
- period
- amplitude

The Parts of a Wave

What makes sound waves, water waves, and seismic waves different from each other? Waves can differ in how much energy they transfer and in how fast they travel. Waves also have other characteristics that make them different from each other.

Suppose you shake the end of a rope and make a transverse wave. The transverse wave in **Figure 8** has alternating high points, called **crests**, and low points, called **troughs**.

On the other hand, a compressional wave has no crests and troughs. When a compressional wave passes through a medium, it creates regions where the medium becomes crowded together and more dense, as in **Figure 8**. These regions are compressions. When you make compressional waves in a coiled spring, the compressions are regions where the coils are close together.

Figure 8 also shows that the coils in the regions next to a compression are spread apart, or less dense. These less-dense regions of a compressional wave are called **rarefactions**.

Figure 8 Transverse and compressional waves have different features that travel through a medium and form the wave.

A transverse wave is made of crests and troughs that travel through the medium.

A compressional wave is made of compressions and rarefactions that travel through the medium.

- Mathematics Skill Activities, p. 9

Figure 9 One wavelength starts at any point on a wave and ends at the nearest point just like it.

For transverse waves, a wavelength can be measured from crest to crest or trough to trough.

The wavelength of a compressional wave can be measured from compression to compression or from rarefaction to rarefaction.

Wavelength

Waves also have a property called wavelength. A **wavelength** is the distance between one point on a wave and the nearest point just like it. **Figure 9** shows that for transverse waves, the wavelength is the distance from crest to crest or trough to trough.

A wavelength in a compressional wave is the distance between two neighboring compressions or two neighboring rarefactions, as shown in **Figure 9**. You can measure from the start of one compression to the start of the next compression or from the start of one rarefaction to the start of the next rarefaction. The wavelengths of sound waves that you can hear range from a few centimeters for the highest-pitched sounds to about 15 m for the deepest sounds.

Reading Check How is wavelength measured in transverse and compressional waves?

Frequency and Period

When you tune your radio to a station, you are choosing radio waves of a certain frequency. The **frequency** of a wave is the number of wavelengths that pass a fixed point each second. You can find the frequency of a transverse wave by counting the number of crests or troughs that pass by a point each second. The frequency of a compressional wave is the number of compressions or rarefactions that pass a point every second. Frequency is expressed in hertz (Hz). A frequency of 1 Hz means that one wavelength passes by in 1 s. In SI units, 1 Hz is the same as 1/s. The **period** of a wave is the amount of time it takes one wavelength to pass a point. As the frequency of a wave increases, the period decreases. Periods are measured in units of seconds.

Observing Wavelength

Procedure

1. Fill a pie plate or other wide pan with water about 2 cm deep.
2. Lightly tap your finger once per second on the surface of the water and observe the spacing of the water waves.
3. Increase the rate of your tapping, and observe the spacing of the water waves.

Analysis

1. How is the spacing of the water waves related to their wavelength?
2. How does the spacing of the water waves change when the rate of tapping increases?

Reading Check

Answer transverse wave—crest to crest or trough to trough; compressional wave—compression to compression or rarefaction to rarefaction

Purpose to observe the relationship between the wavelength and frequency of a wave **L2**

ELL **KS** Kinesthetic

Materials pie plate, water

Teaching Strategy Suggest students use a watch to measure the rate of tapping.

Analysis

1. The closer the waves, the shorter their wavelength.
2. As the rate of tapping increases, the spacing of the waves decreases.

Assessment

Process Have students draw diagrams of the water waves they formed by tapping at two different rates. Ask students to label the wavelength on their diagrams. Use **Performance Assessment in the Science Classroom**, p. 127.

Activity

Compressional Waves Use a metal spring toy to create waves of differing wavelengths, then of differing frequency. Have your students describe how they accomplished each. **L2**

Teacher FYI

Heinrich Hertz The hertz is named for the German physicist Heinrich Hertz. Hertz showed that radio waves are electromagnetic waves, as is light. He produced electromagnetic waves in his laboratory, and he pioneered broadcasting and receiving radio waves.

Differentiated Instruction

English-Language Learners Have students create an illustrated glossary of new terms. Have students write the term on one side of an index card and the definition and an illustration showing what the term means on the other side of the card.

Quick Demo

Measuring Wavelength

Materials meterstick; overhead transparency, projector and pen

Estimated Time five minutes

Procedure Draw transverse waves on the board or on the overhead transparency. Be sure the wavelengths are of equal size. With a meterstick, measure the wavelength of the waves at several heights. Show students that, no matter which two points are chosen to measure wavelength, if the points correspond, the answer is always the same. [L2]

Visual-Spatial

Use Science Words

Word Usage Have students use the word *frequency* to refer to something other than waves.

Possible answer: He looked at his watch with great frequency, glancing at it three times in one minute. Have students explain how the everyday use of the word frequency relates to its use in describing waves. When something has a greater frequency, it occurs more often within a given time period. When waves have a greater frequency, more of them pass a particular point within a given time period. [L2]

Linguistic

Discussion

Traveling Sound Why does sound travel faster in solids than in gases? The particles in solids are close together, and they bump into each other more often than do the particles in a gas.

Why does sound travel faster in warm air than it does in cold air? Gas particles travel faster in warm air than they do in cold air, and they bump into each other more often. [L3]

Logical-Mathematical

Reading Check

Answer As frequency increases, wavelength decreases.

Wavelength Is Related to Frequency If you make transverse waves with a rope, you increase the frequency by moving the rope up and down faster. Moving the rope faster also makes the wavelength shorter. This relationship is always true: as frequency increases, wavelength decreases. **Figure 10** compares the wavelengths and frequencies of two different waves.

The frequency of a wave is always equal to the rate of vibration of the source that creates it. If you move the rope up, down, and back up in 1 s, the frequency of the wave you generate is 1 Hz. If you move the rope up, down, and back up five times in 1 s, the resulting wave has a frequency of 5 Hz.

Reading Check How are the wavelength and frequency of a wave related?

Wave Speed

You're at a large stadium watching a baseball game, but you're high up in the bleachers, far from the action. The batter swings and you see the ball rise. An instant later, you hear the crack of the bat hitting the ball. You see the impact before you hear it because light waves travel much faster than sound waves. Therefore, the light waves reflected from the flying ball reach your eyes before the sound waves created by the crack of the bat reach your ears.

The speed of a wave depends on the medium it is traveling through. Sound waves usually travel faster in liquids and solids than they do in gases. However, light waves travel more slowly in liquids and solids than they do in gases or in empty space. Also, sound waves usually travel faster in a material when the temperature of the material is increased. For example, sound waves travel faster in air at 20°C than in air at 0°C.

Figure 10 The wavelength of a wave decreases as the frequency increases.

Visual Learning

Figure 10 Why might it be more difficult to measure the exact wavelength of a compressional wave than that of a transverse wave? It's difficult to determine where compressions begin and where they end.

[L2] **Logical-Mathematical**

Teacher FYI

Speed of Light The first widely accepted value for the speed of light was calculated by Ole Romer in 1676. He realized that the periods of the orbits of Jupiter's moons appeared shorter when Earth approached Jupiter and longer when Earth receded from Jupiter. His value for the speed of light was about two-thirds the modern value.

Calculating Wave Speed You can calculate the speed of a wave, represented by v , by multiplying its frequency times its wavelength. Wavelength is represented by the Greek letter λ , and frequency is represented by f .

Wave Speed Equation
$$\text{speed (in m/s)} = \text{frequency (in Hz)} \times \text{wavelength (in m)}$$
$$v = f \lambda$$

Why does multiplying the frequency unit Hz by the distance unit m give the unit for speed, m/s? Recall that the SI unit Hz is the same as 1/s. Multiplying $\text{m} \times \text{Hz}$ equals $\text{m} \times 1/\text{s}$, which equals m/s.

Applying Math**Solve a Simple Equation**

THE SPEED OF SOUND What is the speed of a sound wave that has a wavelength of 2.00 m and a frequency of 170.5 Hz?

IDENTIFY known values and the unknown value

Identify the known values:

wavelength of 2.0 m $\Rightarrow \lambda = 2.00 \text{ m}$

frequency of 170.5 Hz $\Rightarrow f = 170.5 \text{ Hz}$

Identify the unknown value:

the speed of a sound wave $\Rightarrow v = ? \text{ m/s}$

SOLVE the problem

Substitute the known values $\lambda = 2.00 \text{ m}$ and $f = 170.5 \text{ Hz}$ into the wave speed equation:

$$v = f \lambda = (170.5 \text{ Hz}) (2.00 \text{ m}) = 341 \text{ m/s}$$

CHECK the answer

Does your answer seem reasonable? Check your answer by dividing the wave speed you calculated by the wavelength given in the problem. The result should be the frequency given in the problem.

Practice Problems

1. A wave traveling in water has a frequency of 500.0 Hz and a wavelength of 3.0 m. What is the speed of the wave?
2. The lowest-pitched sounds humans can hear have a frequency of 20.0 Hz. What is the wavelength of these sound waves if their wave speed is 340.0 m/s?
3. The highest-pitched sound humans can hear have a wavelength of 0.017 m in air. What is the frequency of these sound waves if their wave speed is 340.0 m/s?

For more practice problems go to page 879, and visit Math Practice at fl.gpescience.com.

Deadly Ocean Waves

Tsunamis can cause serious damage when they hit land. These waves can measure up to 30 m tall and can travel faster than 700 km/h. Research which areas of the world are most vulnerable to tsunamis. Describe the effects of a tsunami that has occurred in these areas.

Deadly Ocean Waves all coastal areas of the Pacific Ocean; loss of life, property and land

IDENTIFYING
Misconceptions

Tsunamis Tsunamis are sometimes mistakenly called *tidal waves*, which may cause students to think they are related to tides. A tsunami is set off by an underwater geological disturbance; tides are the result of gravitational interactions between Earth, the Moon, and the Sun. Ordinary waves are stirred up by wind. Point out to students that this is a good example of the wide range of disturbances that can transfer energy by waves.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

Answers to Practice Problems

1. $v = 3.0 \text{ m} \times 500 \text{ Hz} = 1,500 \text{ m/s}$.
2. $\lambda = \frac{340 \text{ m/s}}{20 \text{ Hz}} = 17 \text{ m}$
3. $f = \frac{340 \text{ m/s}}{0.017 \text{ m}} = 20,000 \text{ Hz}$

Reading Strategy

Illustrations Working in pairs, have students make their own illustrations that show the concepts of wavelength, frequency and period, wave speed, and amplitude of transverse and compressional waves. Have students read, illustrate, and reread to check their comprehension as captured by their illustrations.

Curriculum Connection

Math Tell students that as frequency decreases, the wavelength increases if the speed of the wave is constant. Ask students what the relationship between wavelength and frequency is called when the wave speed is constant. They are **inversely proportional**. **L3** **IS** **Linguistic**

Visual Learning

Figure 11 Point out to students the areas of compression and rarefaction in each of the waves in **Figure 11**. Which wave has denser compressions? **the top wave** Which has the less dense rarefactions? **also the top wave** [L2]

Visual-Spatial

Make a Model

Penny Compressions Have students use pennies and 11×17 paper to make models of compression waves. Have students divide the paper into twelve equal sections from left to right. Label the sections *R* (for rarefaction), *T* (for transition), and *C* (for compression). The twelve sections in order should be labeled *R, T, C, T, R, T, C, T, R, T, C, T*. Tell students to fill the areas with pennies to model a compressional wave. The areas of compression should have the most pennies and the areas of rarefaction should have the fewest pennies. Ask students how they would need to move the pennies to increase the amplitude of the wave. **Move pennies out of the rarefaction section and put them in the compression section.** [L2]

Visual-Spatial

Caption Answer

Figure 12 Move the rope only a small distance up and down for smaller amplitude, and a larger distance up and down for greater amplitude.

Post Reading

Reciprocal Teaching Have the class count off as ones and twos. Assign ones to become experts in transverse waves and twos to become experts in compressional waves. Have students work in small groups as they study their own assignments. Then, have ones and twos pair off for reciprocal teaching.

Amplitude and Energy

Why do some earthquakes cause terrible damage, while others are hardly felt? This is because the amount of energy a wave transfers can vary. **Amplitude** is related to the energy transferred by a wave. The greater the wave's amplitude, the more energy the wave transfers. Amplitude is measured differently for compressional and transverse waves.

Amplitude of Compressional Waves The amplitude of a compressional wave is related to how tightly the medium is pushed together at the compressions. The denser the medium is at the compressions, the larger its amplitude is and the more energy the wave transfers. For example, it takes more energy to push the coils in a coiled-spring toy tightly together than to barely move them. The closer the coils are in a compression, the farther apart they are in a rarefaction. So, the less dense the medium is at the rarefactions, the more energy the wave transfers. **Figure 11** shows compressional waves with different amplitudes.

Figure 11 The amplitude of a compressional wave depends on the density of the medium in the compressions and rarefactions.

298 CHAPTER 10 Waves

Differentiated Instruction

Challenge Tell students that AM stands for “amplitude modulation” and that FM stands for “frequency modulation.” Explain that to modulate means to vary the frequency or amplitude. Have students research and report on AM and FM radio technology. **In AM signals, the amplitude is varied to convey the message; in FM signals, the frequency is varied.** [L3] **Linguistic**

Curriculum Connection

Music Play a recording of a piece of music for students. Make sure the music includes soft sections and loud sections. Ask students to identify the portions of the music in which the sound waves have a large amplitude and those where the sound waves have a lower amplitude. **The loud sections have high amplitude waves and the soft sections have low amplitude waves.** [L2] **Auditory-Musical**

Figure 12 The amplitude of a transverse wave is the distance between a crest or a trough and the position of the medium at rest. **Describe** how you could create waves with different amplitudes in a piece of rope.

Amplitude of Transverse Waves If you've ever been knocked over by an ocean wave, you know that the higher the wave, the more energy it transfers. Remember that the amplitude of a wave increases as the energy transferred by the wave increases. So a tall ocean wave has a greater amplitude than a short ocean wave does. The amplitude of any transverse wave is the distance from the crest or trough of the wave to the rest position of the medium, as shown in **Figure 12**.

section 2 review

Summary

The Parts of a Wave

- Transverse waves have repeating high points called crests and low points called troughs.
- Compressional waves have repeating high-density regions called compressions, and low-density regions called rarefactions.

Wavelength, Frequency, and Period

- Wavelength is the distance between a point on a wave and the nearest point just like it.
- A wave's frequency is the number of wavelengths passing a fixed point each second.
- A wave's period is the amount of time it takes one wavelength to pass a fixed point.

Wave Speed and Amplitude

- The speed of a wave depends on the material it is traveling in, and on the temperature.
- The speed of a wave is the product of its frequency and its wavelength:

$$v = f\lambda$$

- As the amplitude of a wave increases, the energy transferred by the wave increases.

Self Check

- Describe** the difference between a compressional wave with a large amplitude and one with a small amplitude.
- Describe** how the wavelength of a wave changes when the wave slows down but its frequency doesn't change.
- Explain** how the frequency of a wave changes when the period of the wave increases.
- Form a hypothesis** to explain why a sound wave travels faster in a solid than in a gas.
- Think Critically** You make a transverse wave by shaking the end of a long rope up and down. Explain how you would shake the end of the rope to make the wavelength shorter. How would you shake the end of the rope to increase the energy transferred by the wave?

Applying Math

- Calculate** the frequency of a water wave that has a wavelength of 0.5 m and a speed of 4.0 m/s.
- Calculate Wavelength** An FM radio station broadcasts radio waves with a frequency of 100,000,000 Hz. What is the wavelength of these radio waves if they travel at a speed of 300,000 km/s?

section 2 review

- A compressional wave with a larger amplitude has particles of the medium closer together in the compressions and farther apart in the rarefactions.
- The wavelength decreases.
- As the period increases, the frequency decreases.
- The particles in a solid are more closely spaced, so that collisions between particles occur more frequently than in a gas, where particles are farther apart.
- To make the wavelength shorter, increase the frequency of the wave by shaking the end of the rope up and down more rapidly. To increase the amplitude, increase the distance

that the end of the rope is moved up and down.

$$6. f = \frac{v}{\lambda} = \frac{(4.0 \text{ m/s})}{(0.5 \text{ m})} = 8.0 \text{ Hz}$$

$$7. \lambda = \frac{v}{f} = \frac{(300,000,000 \text{ m/s})}{(100,000,000 \text{ Hz})} = 3.0 \text{ m}$$

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students draw a diagram of a transverse wave and compressional wave. Have students label the following parts of the waves: trough, crest, rest position, rarefaction, compression, and wavelength.

Reteach

Transverse Waves Give students a piece of string about 60 cm long. Instruct them to work in pairs to shake the string to form a transverse wave. Have students count the number of waves and measure the average wavelength. Suggest that they change the wave so it has a greater amplitude, then change it again so it has shorter wavelengths. What happens to the frequency? **It increases with shorter wavelengths, but it should not change with change in amplitude.** L2 ELL COOP LEARN

Kinesthetic

Assessment

Performance Have students shake a coiled spring toy to form a transverse wave, and then determine which variable (amplitude, wavelength, or frequency) cannot be controlled. **Wavelength can be controlled only indirectly by changing frequency.** Use **PASC**, p. 89. L2

Virtual Labs

Waves What are some characteristics of waves?

 Real-World Problem

Purpose Students will investigate the relationship between wave speed and tension. [L2]

ELL COOP LEARN

Process Skills observe, compare and contrast, interpret data, infer

Time Required 30 minutes

Alternate Materials Telephone cord can be used to demonstrate the behavior of coiled material.

Safety Precautions eye protection, laboratory aprons

 Procedure

Teaching Strategy Caution students before they collect their materials to be careful with the spring toys. They should not be overstretched. If the lengths suggested in the text of the lab will overstretch the toys available, designate new lengths to the students.

Troubleshooting If students have difficulty timing the pulses, have them count the wavelengths instead.

 Analyze Your Data

Expected Outcome Wave speed should be greater in waves 4 through 6.

Answers to Questions

1. Answers will vary.
2. Answers will vary.
3. Answers will vary.

 Conclude and Apply

1. As the length increased, the tension increased.
2. As the tension increased, the wave speed increased; by stretching the toy more.

LAB

Wave Speed and Tension

Before playing her violin, a violinist must adjust the tension, or the amount of force pulling on each end of the string, to make the violin produce the correct notes.

 Real-World Problem

How does the tension in a material affect the waves traveling in the material?

Goal

- **Determine** the relationship between tension and wave speed.

Materials

coiled-spring toy
stopwatch
meterstick

Safety Precautions **Procedure**

1. Attach one end of the spring to a chair leg so that the spring rests on a smooth floor.
2. Stretch the spring along the floor to a length of 1 m.
3. Make a compressional wave by squeezing together several coils and then releasing them.
4. Have your partner time how long a pulse takes to travel two or three lengths of the spring. Record this measurement in the *Wave Time* column of your data table. Record the distance the wave traveled in your data table.
5. Repeat steps 3 and 4 two more times for waves 2 and 3.
6. Stretch the spring to a length of 1.5 m.
7. Repeat steps 3 and 4 for waves 4, 5, and 6.

Data Table

	Distance (m)	Wave Time (s)	Wave Speed (m/s)
Wave 1			
Wave 2			
Wave 3			
Wave 4			
Wave 5			
Wave 6			

 Analyze Your Data

1. **Calculate** the wave speed for each wave using the formula:
$$\text{speed} = \text{distance} / \text{time}$$
2. Calculate the average speed of the waves on the spring with a length of 1.0 m by adding the measured wave speeds and dividing by 3.
3. Calculate the average speed of the waves on the spring with a length of 1.5 m.

 Conclude and Apply

1. How did the tension in the spring change as the length of the spring increased?
2. How did the wave speed depend on the tension? How could you make the waves travel even faster? Test your prediction.

 Communicating Your Data

Compare your results with those of other students in your class. Discuss why results might be different.

 Communicating Your Data

After allowing the students to discuss their results in small groups, list on the board all groups' average wave speeds. If there are significant differences, lead the discussion to an investigation of the toys to see if the medium could be the cause of the differing results. [L2]

 Assessment

Process Provide students with a coiled-spring toy whose stiffness differs considerably from the ones used in lab. Ask them to predict the wave speed in this toy compared to the spring used in the lab. Give students an opportunity to test their predictions. Use **Performance Assessment in the Science Classroom**, p. 93. [L2]

The Behavior of Waves

Reading Guide

FCAT Vocabulary

What You'll Learn

- State the law of reflection.
- Explain why waves change direction when they travel from one material to another.
- Compare and contrast refraction and diffraction.
- Describe how waves interfere with each other.

Why It's Important

You can hear an echo, see shadows, and check your reflection in a mirror because of how waves behave.

Review Vocabulary

perpendicular: a line that forms a 90-degree angle with another line

New Vocabulary

- refraction
- diffraction
- interference
- standing wave
- resonance

Reflection

If you are one of the last people to leave your school building at the end of the day, you'll probably find the hallways quiet and empty. When you close your locker door, the sound echoes down the empty hall. Your footsteps also make a hollow sound. Thinking you're alone, you may be startled by your own reflection in a classroom window. The echoes and your image looking back at you from the window are caused by wave reflection.

Reflection occurs when a wave strikes an object and bounces off it. All types of waves—including sound, water, and light waves—can be reflected. How does the reflection of light allow the boy in **Figure 13** to see himself in the mirror? It happens in two steps. First, light strikes his face and bounces off. Then, the light reflected off his face strikes the mirror and is reflected into his eyes.

Echoes A similar thing happens to sound waves when your footsteps echo. Sound waves form when your foot hits the floor and the waves travel through the air to both your ears and other objects. Sometimes, when the sound waves hit another object, they reflect off it and come back to you. Your ears hear the sound again, a few seconds after you first heard your footstep.

Bats and dolphins use echoes to learn about their surroundings. A dolphin makes a clicking sound and listens to the echoes. These echoes enable the dolphin to locate nearby objects.

Figure 13 The light that strikes the boy's face is reflected into the mirror. The light then reflects off the mirror into his eyes.

List examples of waves that can be reflected.

Activity

Tennis Ball Angles Have students sit on the floor and roll a tennis ball against a wall. Have them first roll the ball directly toward the wall and then at increasing angles to the normal. Ask them what they notice about how the ball bounces off the wall as the angle to the normal is increased. The greater the angle between the normal and the ball's path to the wall, the greater the angle to the normal the ball's path away from the wall. [L1]

ELL LS Kinesthetic

Use an Analogy

Turning Sleds Ask students whether they've ever ridden on a sled that's moved from snow to ice or mud. If the sled hit the ice or mud at an angle, one of its runners hit the ice or mud before the other. That runner then started moving more quickly or more slowly while the other runner stayed at the original speed, causing the sled to turn. Tell students that this is similar to what happens to a sound, seismic, or light wave when it moves from one medium to another. [L2]

✓ Reading Check

Answer when a wave changes speed as it moves from one medium to another at an angle

Use Science Words

Word Origins Have students look up the word *refraction* or *refract* in a dictionary and find the Latin word from which it is derived. Ask students why this word is appropriate to use to describe refraction. The word *refract* comes from the Latin word *refringere*, which means "to break up or break open." When you look at the pencil through water, it looks as if it's broken. [L2]

LS Linguistic

Figure 14 A flashlight beam is made of light waves. When any wave is reflected, the angle of incidence, i , equals the angle of reflection, r .

Refraction

Do you notice anything unusual in **Figure 15**? The pencil looks as if it is broken into two pieces. But if you pulled the pencil out of the water, you would see that it is unbroken. This illusion is caused by refraction. How does it work?

Remember that a wave's speed depends on the medium it is moving through. When a wave passes from one medium to another—such as when a light wave passes from air to water—it changes speed. If the wave is traveling at an angle when it passes from one medium to another, it changes direction, or bends, as it changes speed. **Refraction** is the bending of a wave caused by a change in its speed as it moves from one medium to another. The greater the change in speed is, the more the wave bends.

✓ **Reading Check** When does refraction occur?

Figure 16A on the next page shows what happens when a wave passes into a material in which it slows down. The wave is refracted (bent) toward the normal. **Figure 16B** shows what happens when a wave passes into a medium in which it speeds up. Then the wave is refracted away from the normal.

Figure 15 The pencil looks like it is broken at the surface of the water because of refraction.

Science Journal

Ray Diagrams Have students trace into their Science Journals **Figure 14** and **Figure 16**. Then ask them to use the tracings to construct ray diagrams of the reflection and refraction shown in each one. Tell them to be sure to include the line normal to the surface in each diagram and to measure and label the angles. [L2] LS Visual-Spatial

Figure 16 Light waves travel more slowly in water than in air. This causes light waves to change direction when they move from water to air or air to water.

Predict how the beam would bend if the speed were the same in both air and water.

A When light waves travel from air to water, they slow down and bend toward the normal.

B When light waves travel from water to air, they speed up and bend away from the normal.

Refraction of Light in Water You may have noticed that objects that are under water seem closer to the surface than they really are. **Figure 17** shows how refraction causes this illusion. In the figure, the light waves reflected from the boy's foot are refracted away from the normal and enter your eyes. However, your brain assumes that all light waves have traveled in a straight line. The light waves that enter your eyes seem to have come from a foot that was higher in the water. This is also why the pencil in **Figure 15** seems broken. The light waves coming from the part of the pencil that is under water are refracted, but your brain interprets them as if they have traveled in a straight line. However, the light waves coming from the part of the pencil above the water are not refracted. So, the part of the pencil that is under water looks as if it has shifted.

Figure 17 Light waves from the boy's foot bend away from the normal as they pass from water to air. This makes his foot look closer to the surface than it really is. **Infer** whether the boy's knee would seem closer to the surface than it is.

Caption Answers

Figure 16 The beam wouldn't bend at all. It's the difference in speed that makes the light bend.

Figure 17 Yes, for the same reasons.

Differentiated Instruction

Challenge Light travels at a different speed through glass than it does through air. Ask students to find out whether light travels faster or slower in glass than it does in air. **slower** Have students research to discover how refraction of light waves through glass is made useful in optometry. Ask them to depict their findings on an informational poster. **L3** **IS** **Logical-Mathematical** **P**

Teacher FYI

Medium Refraction How much a wave will be refracted when passing from one medium to another depends on the media involved, the angle of the wave, and sometimes its frequency. Some waves with higher frequencies are refracted more than those with lower frequencies in some media.

Quick Demo

Observing Diffraction

Materials petri dish, water, pen or pencil, overhead projector, scissors, small pieces of cardboard

Estimated Time 10 minutes

Procedure Place the water-filled petri dish on the overhead projector. Use the pen or pencil to make waves in the water. Cut the cardboard pieces into several different shapes, and place them into the dish, one at a time and in different combinations. Have students observe how each piece or combination of pieces causes a different diffraction pattern.

L2 ELL Visual-Spatial

Reading Check

Answer Refraction occurs when waves change direction as they change speed; diffraction occurs when waves bend around an object.

Make a Model

Slit Diffraction Have students use rectangular glass baking dishes and flat pieces of metal or plastic to make a model of the diffraction of water waves through a slit. Have students tape two flat pieces of metal or plastic so they stand vertically across the width of the baking dish. Be sure they leave an open slit between the two pieces. Then have students fill the baking dish with water, use pencils to generate waves, and observe the diffraction. Suggest that students experiment with slit widths until they find the one that diffracts the water waves the most. L2 Visual-Spatial

Kinesthetic

Figure 18 Diffraction causes ocean waves to change direction as they pass a group of islands.

Diffraction

When waves strike an object, several things can happen. Some of the wave's energy can be absorbed by the object. The waves can also be reflected. If the object is transparent, light waves can be refracted as they pass through it. Sometimes, the waves may be both reflected and refracted. If you look into a glass window, sometimes you can see your reflection in the window, as well as objects behind it.

Waves also can behave another way when they strike an object. The waves can bend around the object. **Figure 18** shows how ocean waves change direction and bend after they strike an island. **Diffraction** occurs when an object causes a wave to change direction and bend around it. Diffraction and refraction both cause waves to bend. The difference is that refraction occurs when waves pass through an object, while diffraction occurs when waves pass around an object.

Reading Check

How do diffraction and refraction differ?

Waves also can be diffracted when they pass through a narrow opening, as shown in **Figure 19**. After they pass through the opening, the waves spread out. In this case, the waves are bending around the corners of the opening.

Figure 19 When water waves pass through a small opening in a barrier, they diffract and spread out after they pass through the hole.

Reading Strategy

Paired Reading Have students read this section in pairs. Ask them to stop after each topic and talk about what they learned. Then, they should formulate a sentence or two that explains the main idea and supporting details to add to their K-W-L charts.

Diffraction and Wavelength How much does a wave bend when it strikes an object or an opening? The amount of diffraction that occurs depends on how big the obstacle or opening is compared to the wavelength, as shown in **Figure 20**. When an obstacle is smaller than the wavelength, the waves bend around it. But if the obstacle is larger than the wavelength, the waves do not diffract as much. In fact, if the obstacle is much larger than the wavelength, almost no diffraction occurs. The obstacle casts a shadow because almost no waves bend around it.

Hearing Around Corners For example, suppose that you're walking down a hallway and hear sounds coming from the lunchroom before you reach the open lunchroom door. However, you can't see into the room until you reach the doorway. Why can you hear the sound waves but not see the light waves while you're still in the hallway? The wavelengths of sound waves are similar in size to a door opening. Sound waves diffract around the door and spread out down the hallway. Light waves have a much shorter wavelength. They are hardly diffracted at all by the door. This is why you can't see into the room until you get close to the door.

Diffraction of Radio Waves Diffraction also affects your radio's reception. AM radio waves have longer wavelengths than FM radio waves do. Because of their longer wavelengths, AM radio waves diffract around obstacles such as buildings and mountains. The FM waves with their short wavelengths do not diffract as much. As a result, AM radio reception is often better than FM reception around tall buildings and natural barriers such as hills.

Figure 20 The diffraction of waves around an obstacle depends on the wavelength and the size of the obstacle.

More diffraction occurs when the wavelength is the same size as the obstacle.

Less diffraction occurs when the wavelength is smaller than the obstacle.

Science  online

Topic: Diffraction

Visit fl.gpscience.com for Web links to information about diffraction.

Activity Research the wave lengths of several types of waves. For each wave type, give an example of an object that could cause diffraction to occur.

Teacher FYI

X Rays Because the wavelengths of X rays are about the same size as the distances between atoms in crystals, X rays are diffracted by crystals. This phenomenon is exploited in X-ray crystallography, in which crystals are bombarded from different angles by X rays, and the crystal structure is determined by the diffraction of the X rays. This method has been used to determine the structure of thousands of organic, inorganic, organometallic, and biological compounds.

Discussion

Television Reception TV reception from antennas tends to be poor in mountainous regions. Based on what you read here, what type of radio waves would you guess delivers television signals? Why?

FM waves. Due to their short wavelengths, they do not bend around natural obstacles like mountains. [L2]

Curriculum Connection

Art Have students use reflection, refraction, and diffraction to create artwork. The art could be as simple as sketching how refraction distorts objects viewed through water or as involved as photographing the diffraction patterns of light

waves. Students may wish to research and experiment with how the surface of a CD diffracts light. Have students explain the phenomenon at work in their art. [L2] **ELL** **P** **LS** **Visual-Spatial**

Caption Answer

Figure 21 The sum of the amplitudes of the original waves.

Inquiry Lab

Addition of Waves

Purpose to model interfering waves

Possible Materials translucent straws, sheet of cardboard or poster paper, marker, tape

Estimated Time one class session

Teaching Strategies

- Make a 2×4 grid on a vertical piece of paper with each cell the same size. Use the top half as one set of x and y axes to draw a sine wave. Draw a sine wave of three times the frequency on the x and y axes formed in the bottom half.
- Cover the top with straws (resting on the halfway line) and tape the straws down. Use the marker to trace the sine wave onto the straws. Number the straws on their bottom ends from left to right. Now remove the tape and cut out the sine wave from the tops of the straws.
- Place the bottoms of the straws along the bottom wave. The tops of the straws now show the wave formed by the addition of these two waves.
- You can also try this on a graphing calculator. Graph $y = \sin(x)$, $y = \sin(3x)$, then $y = \sin(x) + \sin(3x)$.
- Extend this lab to other wave additions. Allow students to explore other questions about waves.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Figure 21 Interference occurs while two waves are overlapping. Then the waves combine to form a new wave. Two waves traveling on a rope can interfere with each other.

A Two waves move toward each other on a rope.

B As the waves overlap, they interfere to form a new wave.
Identify What is the amplitude of the new wave?

C While the two waves overlap, they continue to move right through each other. Afterward, they continue moving unchanged, as if they had never met.

Interference

Suppose two waves are traveling toward each other on a long rope, as in **Figure 21A**. What will happen when the two waves meet? If you did this experiment, you would find that the two waves pass right through each other, and each one continues to travel in its original direction, as shown in **Figure 21B** and **Figure 21C**. If you look closely at the waves when they meet each other in **Figure 21B**, you will see a wave that looks different from either of the two original waves. When the two waves arrive at the same place at the same time, they combine to form a new wave. When two or more waves overlap and combine to form a new wave, the process is called **interference**. This new wave exists only while the two original waves continue to overlap. The two ways that the waves can combine are called constructive interference and destructive interference.

306 CHAPTER 10 Waves

Cultural Diversity

Mayan Echoes If you clap your hands in the Mayan temple of Kukulcan at Chichén Itzá in Mexico, you're greeted with a piercing echo. Many believe this echo sounds like the call of a quetzal bird. The bird is native to the region and prized for its bright colors and long tail. Archaeologists are studying the architecture of

the temple to determine whether the Maya built it with this effect in mind. The shrieking, birdlike echo is produced by sound waves being diffracted by the gaps in the steps of one of the large staircases. The sound's amplification comes from waves interfering at just the right places.

A If Wave 1 and Wave 2 overlap, they constructively interfere and form the green wave. Wave 1 and Wave 2 are in phase.

B If Wave 1 and Wave 2 overlap, they destructively interfere and form the green wave. Wave 1 and Wave 2 are out of phase.

Figure 22 When waves interfere with each other, constructive and destructive interference can occur.

Infer how the energy transferred by each wave changes when interference occurs.

Constructive Interference In constructive interference, shown in **Figure 22A**, the waves add together. This happens when the crests of two or more transverse waves arrive at the same place at the same time and overlap. The amplitude of the new wave that forms is equal to the sum of the amplitudes of the original waves. Constructive interference also occurs when the compressions of different compressional waves overlap. If the waves are sound waves, for example, constructive interference produces a louder sound. Waves undergoing constructive interference are said to be in phase.

Destructive Interference In destructive interference, the waves subtract from each other as they overlap. This happens when the crests of one transverse wave meet the troughs of another transverse wave, as shown in **Figure 22B**. The amplitude of the new wave is the difference between the amplitudes of the waves that overlapped. With compressional waves, destructive interference occurs when the compression of one wave overlaps with the rarefaction of another wave. The compressions and rarefactions combine and form a wave with reduced amplitude. When destructive interference happens with sound waves, it causes a decrease in loudness. Waves undergoing destructive interference are said to be out of phase.

Noise Damage People who are exposed to constant loud noises, such as those made by airplane engines, can suffer hearing damage. Special ear protectors have been developed that use destructive interference to cancel damaging noise. With a classmate, list all the jobs you can think of that require ear protectors.

Activity

Creating Interference Position a student at each end of a jump rope, and have them make different interference patterns in the rope. Challenge the students to create both constructive and destructive interference. **L2 ELL**

COOP LEARN **IS** Kinesthetic

Quick Demo

Interference Effects

Materials two or more musical instruments

Estimated Time 10 minutes

Procedure Ask students who play instruments to bring them in and demonstrate what happens when two notes that have almost the same pitch are played at the same time. Students should be able to hear the beats produced by the interference between the two notes. These pulses of sound disappear when the pitches become equal, so they are used by musicians as they tune their instruments. **L2 IS Auditory-Musical**

Noise Damage The use of destructive interference to cancel out noise is called active noise control. In active noise control, sounds are generated that exactly cancel out the unwanted sounds. Jobs requiring ear protection include rock concert sound mixer, airport runway worker, and factory worker.

Research Have students research the various types of hearing-protection devices that are available. Have students give a brief oral report to the class describing the various types.

Caption Answer

Figure 22 Destructive interference results in less energy transferred; constructive interference results in more energy transferred than each wave transferred independently.

Fun Fact

When we listen to an orchestra, the sound waves that reach our ears have the amplitude and frequency that result from adding together all of the waves produced by the individual instruments.

Curriculum Connection

History Scientists first knew that light had wave properties when it could be shown that it produced interference patterns when passed through a slit. Have students find out whose experiments first showed this, and when. **Thomas Young in 1801**

L3 IS Linguistic

Caption Answer

Figure 23 The nodes of a standing wave form where the waves traveling in opposite directions cancel out.

Purpose Students observe resonance and the conditions under which it can occur. **L2** **ELL**

AS Auditory-Musical

Materials three tuning forks, two of which are at the same frequency, mallet

Teaching Strategy Demonstrate for students the best way to set a tuning fork vibrating. You don't have to hit it hard, but you do have to hit it sharply.

Analysis

The second tuning fork started vibrating, but the third one did not. The natural frequency of the second tuning fork is the same as the frequency of the waves that were hitting it from the first tuning fork, so it resonated. The natural frequency of the third tuning fork is different, so it did not resonate.

Assessment

Process Have students take the tuning forks to different areas of the classroom and see if they can find anything else that resonates with them. Use

Performance Assessment in the Science Classroom, p. 97.

Figure 23 Standing waves form a wave pattern that seems to stay in the same place.

Explain how nodes form in a standing wave.

Standing Waves

When you make transverse waves with a rope, you might shake one end while your friend holds the other end still. What would happen if you both shook the rope continuously to create identical waves moving toward each other? As the two waves travel in opposite directions down the rope, they continually pass through each other. Interference takes place as the waves from each end overlap along the rope. At any point where a crest meets a crest, a new wave with a larger amplitude forms. However, at points where crests meet troughs, the waves cancel each other and no motion occurs.

The interference of the two identical waves makes the rope vibrate in a special way, as shown in **Figure 23**. The waves create a pattern of crests and troughs that do not seem to be moving. Because the wave pattern stays in one place, it is called a standing wave. A **standing wave** is a special type of wave pattern that forms when waves equal in wavelength and amplitude, but traveling in opposite directions, continuously interfere with each other. The places where the two waves always cancel are called nodes. The nodes always stay in the same place on the rope. Meanwhile, the wave pattern vibrates between the nodes.

Standing Waves in Music When the string of a violin is played with a bow, it vibrates and creates standing waves. The standing waves in the string help produce a rich, musical tone. Other instruments also rely on standing waves to produce music. Some instruments, such as flutes, create standing waves in a column of air. In other instruments, such as drums, a tightly stretched piece of material vibrates in a special way to create standing waves. As the material in a drum vibrates, nodes are created on the surface of the drum.

Visual Learning

Figure 23 Provide pairs of students with jump ropes, and ask them to create standing waves similar to those shown in **Figure 23**. **L2**

AS Kinesthetic

Resonance

You might have noticed that bells of different sizes and shapes create different notes. When you strike a bell, the bell vibrates at certain frequencies called the natural frequencies. All objects have their own natural frequencies of vibration, which depend on the object's size, shape, and the material it is made from.

There is another way to make something vibrate at its natural frequencies. Suppose you have a tuning fork that has a single natural frequency of 440 Hz. Imagine that a sound wave of the same frequency strikes the tuning fork. Because the sound wave has the same frequency as the natural frequency of the tuning fork, the tuning fork will vibrate. The process by which an object is made to vibrate by absorbing energy at its natural frequencies is called **resonance**.

Sometimes, resonance can cause an object to absorb a large amount of energy. Recall that the amplitude of a wave increases as the energy it transfers increases. In the same way, an object vibrates more strongly as it continues to absorb energy at its natural frequencies. If enough energy is absorbed, the object can vibrate so strongly that it breaks apart.

Mini LAB

Experimenting with Resonance

Procedure

1. Strike a **tuning fork** with a **mallet**.
2. Hold the vibrating tuning fork 1 cm from a **second tuning fork** that has the same frequency.
3. Strike the tuning fork again. Hold it 1 cm from a **third tuning fork** that has a different frequency.

Analysis

What happened when you held the vibrating tuning fork near each of the other two? Explain.

1 Post Reading

Discussion Have students report the answers to questions generated in their K-W-L charts about light and sound waves. Students may find it interesting to make connections between their lives and science by exploring electronically synthesized music and laser light shows.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students create illustrated diagrams of the following wave behaviors: reflection, refraction, diffraction, interference, and standing wave. Have students label each drawing using the correct term.

Reteach

Wave Patterns Give pairs of students pieces of yarn and construction paper. Ask them to glue the yarn to the paper to show wave patterns. Students should identify the amplitude, wavelength, and frequency of the waves and point out any nodes.

L2 COOP LEARN **AS** Kinesthetic

✓ Assessment

Performance Have students make up songs describing the reflection, refraction, diffraction, and interference of waves. Use **Performance Assessment in the Science Classroom**, p. 151. **L1**

section 3 review

Summary

Reflection and Refraction

- When reflection of a wave occurs, the angle of incidence equals the angle of reflection.
- Refraction occurs when a wave changes direction as it moves from one medium to another.

Diffraction

- Diffraction occurs when a wave changes direction by bending around an obstacle.
- The effects of diffraction are greatest when the wavelength is nearly the obstacle's size.

Interference and Resonance

- Interference occurs when two or more waves overlap and form a new wave.
- Interference between two waves with the same wavelength and amplitude, but moving in opposite directions, produces a standing wave.
- Resonance occurs when an object is made to vibrate by absorbing energy from vibrations at its natural frequencies.

Self Check

1. **Compare** the loudness of sound waves that are in phase when they interfere with the loudness of sound waves that are out of phase when they interfere.
2. **Describe** how the reflection of light waves enables you to see your image in a mirror.
3. **Describe** the energy transformations that occur when one tuning fork makes another tuning fork resonate.
4. **Think Critically** Suppose the speed of light were greater in water than in air. Draw a diagram to show whether an object under water would seem deeper or closer to the surface than it really is.

Applying Math

5. **Use Percentages** You aim a flashlight at a window. The radiant energy in the reflected beam is two-fifths of the energy in the incident beam. What percentage of the incident beam energy passed through the window?
6. **Calculate Angle of Incidence** The angle between a flashlight beam that strikes a mirror and the reflected beam is 80°. What is the angle of incidence?

section 3 review

1. Sound waves that are in phase will be louder than the two waves are individually. Sound waves that are out of phase will be softer.
2. The light strikes your face and bounces off. The reflected light off your face strikes the mirror and is reflected into your eyes.
3. tuning fork vibrates forming a sound wave—mechanical energy to sound energy; sound waves strike tuning fork and make it vibrate—sound energy to mechanical energy
4. Students' drawings should show objects deeper than they actually are.
5. 60 percent
6. 40°

 Video Lab available for this Lab.

Real-World Problem

Purpose Students will generate transverse waves with a long spring and measure the speed and frequency of the waves. 

Process Skills Observe, measure, recognize cause and effect, make and use tables, interpret data.

Time Required 45 minutes

Safety Precautions Caution students to keep a firm hold on the spring so it doesn't fly off and hit someone.

Procedure

Teaching Strategy Suggest to students that they practice the procedures for making and counting waves described in steps 2, 3, and 6 several times before they make their measurements.

Troubleshooting Make sure the spring has no kinks or rough places in it, as this will make it difficult for students to produce consistent waves.

Differentiated Instruction

Learning Disabled Have these students work in groups with students proficient in the lab. As students do the activity, have them take turns illustrating for each other the wavelength, frequency, and amplitude of waves they generate. Ask them to also create compressional waves, and compare and contrast them with transverse waves.  

Linguistic

LAB

Measuring Wave Properties

Real-World Problem

Some waves travel through space; others pass through a medium such as air, water, or earth. Each wave has a wavelength, speed, frequency, and amplitude. How can the speed of a wave be measured? How can the wavelength be determined from the frequency?

Procedure

1. With a partner, stretch your spring across an open floor and measure the length of the spring. Record this measurement in the data table. Make sure the spring is stretched to the same length for each step.
2. Have your partner hold one end of the spring. Create a single wave pulse by shaking the other end of the spring back and forth.
3. Have a third person use a stopwatch to measure the time needed for the pulse to travel the length of the spring. Record this measurement in the *Wave Time* column of your data table.
4. Repeat steps 2 and 3 two more times.
5. **Calculate** the speed of waves 1, 2, and 3 in your data table by using the formula $\text{speed} = \text{distance}/\text{time}$. Average the speeds of waves 1, 2, and 3 to find the speed of waves on your spring.
6. **Create** a wave with several wavelengths. You make one wavelength when your hand moves left, right, and left again. Count the number of wavelengths that you generate in 10 s. Record this measurement for wave 4 in the *Wavelength Count* column in your data table.
7. **Repeat** step 6 two more times. Each time, create a wave with a different wavelength by shaking the spring faster or slower.

310 CHAPTER 10 Waves

Alternative Inquiry Lab

Waves and Boundaries To extend this Lab into an Inquiry Lab, have students observe wave behavior at a boundary. To simulate waves traveling between two media, attach a hose and a rope, or two other materials, end to end and create a pulse.

Try starting the pulse from the other end. Compare transmitted pulse to reflected pulse. Interested students can research coated optics (such as antiglare coating on glasses and camera lenses) or other uses for these wave properties.

Using Scientific Methods

Analyze Your Data

1. Calculate the frequency of waves 4, 5, and 6 by dividing the number of wavelengths by 10 s.
2. Calculate the wavelength of waves 4, 5, and 6 using the formula $\text{wavelength} = \text{wave speed} / \text{frequency}$. Use the average speed calculated in step 5 for the wave speed.

Wave Property Measurement

	Spring Length	Wave Time	Wave Speed
Wave 1	Results will vary depending on the springs used.		
Wave 2			
Wave 3			
	Wavelength Count	Frequency	Wavelength
Wave 4	Results will vary depending on the springs used.		
Wave 5			
Wave 6			

Conclude and Apply

1. Was the wave speed different for the three different pulses you created? Why or why not?
2. Why would you average the speeds of the three different pulses to calculate the speed of waves on your spring?
3. How did the wavelength of the waves you created depend on the frequency of the waves?

Communicating Your Data

Ask your teacher to set up a contest between the groups in your class. Have each group compete to determine who can create waves with the longest wavelength, the highest frequency, and the largest wave speed. Record the measurements of each group's efforts on the board.

Analyze Your Data

Expected Outcome Wave times measured in steps 3 and 4 should be similar.

Answers to Questions

1. Answers will vary.
2. Answers will vary.

Error Analysis Have groups compare their data with other students and discuss possible reasons for errors. As they compare their data, make sure students understand that wave times and wave speeds will be different for different springs.

Conclude and Apply

1. Accept all reasonable responses. Wave speed probably varies because it would be difficult to shake the spring exactly the same way each time.
2. to compensate for errors in measurement
3. Wavelength decreased as frequency increased. $\text{Wavelength} = \text{wave speed} / \text{frequency}$

Assessment

Performance Ask students to repeat the activity, but this time to generate compressional waves. Use **Performance Assessment in the Science Classroom**, p. 97.

Active Reading

Reflective Journal Have students divide pieces of paper into several columns. Have them record their thoughts under headings such as *What I did*, *What I learned*, *Questions I have*, and *Surprises I experienced*. Have students write a Reflective Journal entry for this activity. **L2**

Communicating Your Data

Help students analyze the data on the board to determine whether there was any relationship between the amplitude, frequency, wavelength, and wave speed of the winning waves.

Content Background

The speed of sound in water was first calculated in 1822. Unlike light or radio waves, sound waves can travel long distances underwater.

Piezoelectric crystals discovered in the late 1800s made modern sonar feasible. When compressed, they produce an electrical charge. This enabled the development of transducers that could change the mechanical energy of sound waves into electrical signals.

Sonar enables the detection of silent objects by bouncing a sound wave from the object and listening for the echo. Today, sonar is used to inspect metals for flaws, monitor oceanic temperatures, and determine the health of unborn babies.

Historical Significance

The development of sonar tremendously increased the safety of shipping. Sonic fathometers allow deep drafted vessels to safely navigate previously hazardous channels. The ability to detect icebergs lengthens the shipping season in the high latitudes. In wartime sonar was a key element in the protection of commercial convoys.

Sonar and related technologies have improved the search for oil, made it possible to locate sunken objects, and have improved the quality of medical diagnostics and the integrity of structural materials.

This machine houses side-scan sonar. It was used to help locate the wreck of the *Titanic*.

What is sonar?

Sonar is a device that uses sound waves to locate and measure the distance to underwater objects. Its name is a shortened version of S**ound** N**avigation** and R**anging**.

How does sonar work?

Sonar sends out a ping sound that reflects back when it hits an underwater object. Because sound travels through water at a known speed (about 1,500 m/s), scientists measure how long the sound takes to return, then they calculate the distance.

Why was it invented?

Sonar was developed by scientists in the early twentieth century as a way to detect icebergs and prevent boating disasters. Its technical

advancement was hurried by the Allies' need to detect German submarines in World War I. By 1918, the United States and Great Britain had developed an active sonar system placed in submarines sent to attack other subs.

By World War II, sonar allowed ships to defend themselves effectively from enemy subs. The strategy was to use sonar to find subs and then fire depth charges at them from a safe distance. After the war, sonar-absorbing hulls and quiet engines and machinery ensured that subs could partly shield themselves from sonar.

Sonar is now used to help find schools of fish. Oceanographers also use it to map ocean and lake floors. Sonar has been vital, too, in the discovery of sunken airplanes and ships.

In 1985, a French and American team used a new type of sonar device called side-scan sonar to locate the *Titanic*, the passenger liner that sank in 1912. This kind of sonar projects a tight beam of sound to create detailed images of the sea bed. Members of the expedition towed this sonar device about 170 m above the seabed across a section of the Atlantic Ocean where the *Titanic* went down. Weeks later, video cameras finally spotted the wreck.

Report Research how sonar was used by navies in World War I and World War II. Did sonar affect each war's outcome? How did it save lives? What uses can you think of for sonar if it could be used in everyday life?

Report Have students research the modern uses of acoustic technology and make a "Family Tree" chart of all the products and equipment they can discover that perform their primary function through the use or detection of sounds, both audible and inaudible. Through class discussion, determine which are directly related to sonar and its basic principles. **L2**

Reviewing Main Ideas

Section 1 The Nature of Waves

1. Waves are rhythmic disturbances that transfer energy through matter or space.
2. Waves transfer only energy, not matter.

3. Transverse and compressional waves can be described by their wavelengths, frequencies, periods, and amplitudes. As frequency increases, wavelength always decreases.
4. The greater a wave's amplitude is, the more energy it transfers.

3. Mechanical waves need matter to travel through. Mechanical waves can be compressional or transverse.
4. When a transverse wave travels in a medium, matter in the medium moves at right angles to the direction the wave travels.
5. When a compressional wave travels in a medium, matter moves back and forth along the same direction that the wave travels.

Section 2 The Behavior of Waves

1. For all waves, the angle of incidence equals the angle of reflection.
2. A wave is bent, or refracted, when it changes speed as it enters a new medium.
3. When two or more waves overlap, they combine to form a new wave. This process is called interference.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review waves.

Section 2 Wave Properties

1. The movement of high points in a medium, called crests, and low points, called troughs, forms a transverse wave.
2. The movement of more-dense regions, called compressions, and less-dense regions, called rarefactions, forms a compressional wave.

CHAPTER STUDY GUIDE 313

Identifying Misconceptions

After students have done the activity at the beginning of this chapter, have them perform this activity.

Materials corks, pan of water, eyedropper

Procedure Have students work in groups and use the materials provided to design an experiment

to see how water waves move corks. Use the dropper to create the waves.

Expected Outcome Students will realize that the corks are not displaced by the waves. Students should realize that the medium does not travel with the waves. **L2**

Directions: Carefully review the table and answer the following questions.

Electromagnetic Waves in Your Life		
Type of wave	Shortest wavelength (cm)	Longest wavelength (cm)
Radio waves	0.1	10,000,000
Microwaves	0.1	100
Red light	0.000063	0.000078
Green light	0.000049	0.000056
Blue light	0.000045	0.000049
X rays	0.00000001	0.000001

1. Electromagnetic waves of different wavelengths have been given different names. According to the table, which type of electromagnetic wave can have a wavelength greater than 5 m?
A. Radio waves B. Microwaves C. Red light D. Blue light
2. According to the table, which type of electromagnetic wave can have a wavelength of 0.000046 cm?
F. Radio waves G. Microwaves H. Red light I. Blue light
3. If a device were emitting an electromagnetic wave of 0.00000001 cm, what kind of device would it be?
A. Radio B. Microwave oven C. Flashlight D. X-ray machine

L2

FOLDABLES Have students use their Foldables to review the content of the chapter. How would the differences between light waves and sound waves become apparent if you were visiting the Moon? Explain. **L2**

Using Vocabulary

1. Reflection and refraction both involve waves contacting a surface and changing direction. In reflection, waves bounce off a surface, whereas refraction occurs when waves enter a new medium at an angle, change speed, and are bent.
2. Standing waves have nodes that do not move.
3. The rarefaction of a compressional wave has the lowest density.
4. Refraction and diffraction describe the bending of a wave.
5. When waves overlap, they interfere and form a new wave.
6. The amplitude of any transverse wave is the distance from the crest or trough to the rest position of the medium.
7. Frequency measures how many wavelengths pass a fixed point each second.
8. A mechanical wave always travels through a medium.

FCAT Vocabulary

Answer the following questions using complete sentences.

1. Compare and contrast reflection and refraction.
2. Which type of wave has points called nodes that do not move?
3. Which part of a compressional wave has the lowest density?
4. Find two words in the vocabulary list that describe the bending of a wave.
5. What occurs when waves overlap?
6. What is the relationship among amplitude, crest, and trough?
7. What does frequency measure?
8. What does a mechanical wave always travel through?

Checking Concepts

Choose the word or phrase that best answers each question.

9. Which of the following do waves transfer?
A) matter
B) energy
C) matter and energy
D) the medium
10. What is the formula for calculating wave speed?
A) $v = \lambda f$
B) $v = f - \lambda$
C) $v = \lambda / f$
D) $v = \lambda + f$

11. When a compressional wave travels through a medium, which way does matter in the medium move?
A) backward
B) forward
C) perpendicular to the rest position
D) along the same direction the wave travels
12. What is the highest point of a transverse wave called?
A) crest
B) compression
C) wavelength
D) trough
13. If the frequency of the waves produced by a vibrating object increases, how does the wavelength of the waves produced change?
A) It stays the same.
B) It decreases.
C) It vibrates.
D) It increases.
14. If the amplitude of a wave changes, which of the following changes?
A) wave energy
B) frequency
C) wave speed
D) refraction
15. Which term describes the bending of a wave around an object?
A) resonance
B) interference
C) diffraction
D) reflection
16. What is equal to the angle of reflection?
A) refraction angle
B) normal angle
C) bouncing angle
D) angle of incidence

Use the table below to answer question 17.

Speed of Sound in Air

Temperature (°C)	Sound Speed (m/s)
0	331.4
10	337.4
20	343.4

17. Based on the data in the table above, which of the following would be the speed of sound in air at 30°C?
A) 340.4 m/s
B) 346.4 m/s
C) 353.4 m/s
D) 349.4 m/s

Interpreting Graphics

18. Copy and complete the following concept map.

Thinking Critically

19. **Explain** An earthquake on the ocean floor produces a tsunami that hits a remote island. Is the water that hits the island the same water that was above the earthquake on the ocean floor?
20. **Compare** Suppose waves with different amplitudes are produced by a vibrating object. How do the frequencies of the waves with different amplitudes compare?
21. **Explain** Use the law of reflection to explain why you see only a portion of the area behind you when you look in a mirror.
22. **Explain** why you can hear a fire engine coming around a street corner before you can see it.

23. **Describe** the objects or materials that vibrated to produce three of the sounds you've heard today.
24. **Form a Hypothesis** In 1981, people dancing on the balconies of a Kansas City, Missouri, hotel caused the balconies to collapse. Use what have you learned about wave behavior to form a hypothesis that explains why this happened.
25. **Make and Use Tables** Find information in newspaper articles or magazines describing five recent earthquakes. Construct a table that shows for each earthquake the date, location, magnitude, and whether the damage caused by the earthquake was light, moderate, or heavy.
26. **Concept Map** Design a concept map that shows the characteristics of transverse waves. Include the terms *crest*, *trough*, *medium*, *wavelength*, *frequency*, *period*, and *amplitude*.

Applying Math

27. **Calculate Wavelength** Calculate the wavelength of a wave traveling on a spring if the wave moves at 0.2 m/s and has a period of 0.5 s.
28. **Calculate Wavespeed** The microwaves produced inside a microwave oven have a wavelength of 12.0 cm and a frequency of 2,500,000,000 Hz. At what speed do the microwaves travel in units of m/s?
29. **Calculate Frequency** Water waves on a lake travel toward a dock with a speed of 2.0 m/s and a wavelength of 0.5 m. How many wave crests strike the dock each second?

Thinking Critically

19. No; the water that hits the island is water that already was near the island. Through the wave, it has received energy from the earthquake miles away.
20. frequency is independent of amplitude
21. In a mirror, you can see only objects located at an angle such that their reflected beam bounces toward your eyes.
22. Sound waves have a longer wavelength than light waves. They can diffract around the street corner, but light waves cannot.
23. Possible answers: vocal cords, bell, car engine
24. The dancers created vibrations at the resonant frequency of the balcony. The vibrations of the balcony increased as it absorbed energy at its resonant frequency until its amplitude of vibration was large enough to cause the balcony to break.
25. Check students' work. Make sure magnitude is given in the same scale for all earthquakes.
26. Check students' work.

Applying Math

Math Standards

National: 1, 2, 9

Florida: MA.B.1.4.2

$$27. f = \frac{1}{\text{period}} = \frac{1}{0.5_s} = 2 \text{ Hz};$$

$$\lambda = \frac{v}{f} = \frac{(0.2 \text{ m/s})}{2 \text{ Hz}}$$

$$= 0.1 \text{ m}$$

$$28. v = \lambda f$$

$$= (0.12 \text{ m})(2.5 \times 10^9 \text{ Hz})$$

$$= 3.0 \times 10^8 \text{ m/s}$$

$$29. f = \frac{v}{\lambda} = \frac{(2.0 \text{ m/s})}{(0.5 \text{ m})} = 4 \text{ Hz};$$

Go On

Record your answers on the answer sheet provided by your teacher or on a sheet of paper.
The assessed Florida Benchmark appears above the question.

Multiple Choice

- When a transverse wave travels through a medium, which way does matter in the medium move?
 - backward
 - in all directions
 - at right angles to the direction the wave travels
 - in the same direction the wave travels

Use the illustration below to answer questions 2 and 3.

- What wave property is shown at G?
 - amplitude
 - wavelength
 - crest
 - trough
- What property of the wave is shown at H?
 - amplitude
 - wavelength
 - crest
 - trough

Use the illustration below to answer questions 4 and 5.

- What kind of wave is shown?
 - mechanical
 - compressional
 - transverse
 - both A and B
- What happens to the yarn tied to the coil?
 - It moves back and forth as the wave passes.
 - It moves up and down as the wave passes.
 - It does not move as the wave passes.
 - It moves to the next coil as the wave passes.

SC.8.14.2

- What kind of waves are the seismic waves produced during an earthquake?
 - transverse
 - compressional
 - combination of transverse and compressional
 - electromagnetic

7. What is the bending of a wave as it enters a new material called?

A. refraction
B. diffraction
C. reflection
D. interference

Gridded Response

8. A tuning fork vibrates at a frequency of 256 Hz. The wavelength of the sound produced by the tuning fork is 1.32 m. What is the speed of the wave in m/s?
9. A wave has a speed of 345 m/s and its frequency is 2050 Hz. What is its wavelength in m?

Short Response

Use the illustration below to answer questions 10 and 11.

10. Determine the amplitudes and the wavelengths of each of the three waves.
11. If the length of the x -axis on each diagram represents 2 s of time, what is the frequency of each wave?

Extended Response

12. In a science fiction movie, a huge explosion occurs on the surface of a planet. People in a spaceship heading toward the planet see and hear the explosion. Is this realistic? Explain.

Use the illustrations below to answer question 13.

13. The illustrations show two mechanical waves.
- Part A** Describe how the amplitude of each of the two waves shown is defined.
- Part B** Describe how you would change both drawings to show waves that transfer more energy.

Test-Taking Tip

Answer Every Question Never leave any open-ended answer blank. Answer each question as best you can. You can receive partial credit for partially correct answers.

Question 12 Before you answer the question, list what you know about light waves and sound waves.

Gridded Response

8. 338
9. 0.168

Short Response

10. A: Amp. = 0.5 m; λ = 1.0 m;
B: Amp. = 0.4 m; λ = 2.0 m;
C: Amp. = 0.6 m; λ = 2.0 m;
11. A, 2 Hz; B, 1 Hz; C, 1 Hz

Extended Response

12. No, sound waves must have a medium to travel through. Sound waves would not travel through outer space. They would see the explosion because light waves do not require a medium to travel.

PART A: The wavelength of the compressional wave is the distance from compression to compression or rarefaction to rarefaction. The wavelength of the transverse wave is the distance from crest to crest or trough to trough.

PART B: For the compressional wave, make the spring coil farther apart in the rarefactions and closer together in the compressions. For the transverse wave, make the crests higher and the troughs deeper.

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubrics on p. 9T.

Section/Objectives	Standards		Lab/Features

Section Focus

Section Focus Transparency **Noisy Machines** Chapter 11

Two hundred years ago, the world was profoundly different from the world we live in today. Since then, the world has been making more and more noise. Exposure to loud noises can cause hearing loss, tinnitus, and hearing loss.

How do sounds differ?
Why do you think this worker is wearing earplugs?

L2

Section Focus Transparency **Knight Light** Chapter 11

The color of stained glass is made by combining different metals and oxides. But the beautiful colors in stained glass are also a result of the way light passes through the glass. Light enters the glass and is split into its component colors. The color of light changes from morning to night, even from one side of the pane to the other. The color of light changes from morning to night, even from one side of the pane to the other.

1. Which color of light enters through the window?
2. Which color of light enters through the window?
3. What does the color of light change with the light?

L2

Section Focus Transparency **Fun House Mirrors** Chapter 11

Fun house mirrors are an amusement park attraction. You may have seen fun house mirrors like this one. These fun house mirrors provide distorted images of the person looking into them. Fun house mirrors are often found in the fun house, along with other amusing exhibits.

How does the image made by a fun house mirror differ from that of a flat mirror? What does the image look like? Why?
What does the image look like? Why?

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

L2

Science Content Background

Section Sound

A sound wave is a type of mechanical wave called a compressional or longitudinal wave. The compressions and rarefactions produced cause temporary changes in the pressure of the medium through which the waves travel. Our ears respond to this changing pressure and interpret it as sound.

Intensity and Loudness

Sound intensity is the amount of energy that passes through a given area in a given amount of time. Because sound waves spread out as they travel, the intensity of a sound decreases as it travels and is proportional to the inverse square of the distance from the source. This means that if the distance from the source doubles, the intensity of sound is one-fourth as large. Humans can detect very low levels of sound. This threshold is defined as 0 dB. A sound of 0 dB will move our eardrums as little as one-billionth of a centimeter, but we can still hear it.

The Doppler Effect

When an airplane going faster than the speed of sound passes over us, it produces a very loud noise called a sonic boom. This is an example of the Doppler effect. The sound waves are pushed closer together as the high-speed airplane continues to produce sound waves. The plane goes so fast that the waves pile up on each other. Then the wave energy reaches the listener all at once, producing a loud noise.

Section Reflection and Refraction of Light

Reflection of Light

The reason we can see objects is that they either emit or reflect light. Most materials don't produce their own light, so almost everything we see is reflected light. The

reflected light travels to the retinas of our eyes, where an image is received and sent to the brain.

Transparency

Materials that are transparent to visible light are not necessarily transparent to other wavelengths. For example, clear glass transmits long-wavelength ultraviolet rays but blocks most short-wavelength ultraviolet rays. This is why you are not likely to get a sunburn through a window.

Refraction of Light

For refraction to occur, light must pass at an angle other than 90° from one material into another with a different index of refraction. When light slows down as it moves from one material to another, it is refracted toward the normal. When it speeds up, it is refracted away from the normal.

When most people swim underwater without goggles, their vision is not as good. Normally light is refracted when it goes from air into the eye, and this is necessary in order to see clearly. Because water has a higher index of refraction than air, light is not refracted enough by water. Wearing goggles puts air in front of the eye and restores normal vision.

Teacher to Teacher

Erin Peters
Lead Science Teacher
Williamsburg Middle School
Arlington, VA

"I use a wind-up music box apparatus to demonstrate how sound waves travel through different mediums. Hold the apparatus in the air, wind the arm, and listen to the sound that it makes. The sound should be very quiet. Now wind the arm and put the apparatus on the desk. It should sound like the music box. Sound waves travel better when the vibrating particles are closer together."

Erin Peters

section 3 Mirrors, Lenses, and the Eye **Mirrors**

The law of reflection applies whenever light is reflected. The angle of incidence is equal to the angle of reflection. To determine these angles, an imaginary reference line called the normal line is drawn perpendicular to the reflecting surface. The angle between the incident ray and the normal is the angle of incidence. The angle between the reflected ray and the normal is the angle of reflection. The law of reflection applies to plane mirrors as well as convex and concave mirrors.

Lenses

A lens is a curved, transparent device that bends light that passes through it. The bending, or refraction, of light requires two conditions: (a) Light must pass from one material through another that has a different optical density; (b) the light must enter the lens at an angle other than perpendicular.

Concave lenses and convex mirrors both cause light rays to diverge. When light rays are made to diverge, the image that is formed is virtual. The image seems to be located where the diverging light rays would converge if they were extended backward. As a result, no light rays actually pass through the location of a virtual

image. Convex lenses and concave mirrors also cause light rays to diverge and form virtual images when the object is located less than one focal length from the lens or mirror. For all other object locations, convex lenses and concave mirrors form real images.

The Human Eye

Eyes focus by a process called accommodation. In this process, muscles attached to the eye lens make the lens thinner or thicker to form a sharp image on the retina. Most people with glasses or contact lenses wear concave lenses to correct myopia, or nearsightedness. This condition has various causes. For instance, a person may genetically have an eyeball that is too long, causing a sharp image to be formed in front of, instead of on, the retina.

section 4 Light and Color **Mixing Colors**

Three types of color dots—red, blue, and green—are repeated throughout the screen of a color television. By varying the intensity of the light emitted by each, all colors can be displayed.

Each primary pigment color results when one of the primary colors of light is absorbed. Magenta corresponds to the absorption of green, cyan to the absorption of red, and yellow to the absorption of blue.

Cracking the Sound Barrier

Have you ever heard a sonic boom? A plane moving faster than the speed of sound makes a sonic boom. The sound waves from the plane add together to form a cone-shaped shock wave. Behind the cone are low-pressure regions that can cause water vapor to condense, forming the cloud you see here.

Science Journal Write three things that you would like to learn about sound.

Theme Connection

Energy Sound and light are waves that transfer energy. Sound is a mechanical, compressional wave that transfers energy by the collisions of molecules. Light transfers energy by electromagnetic radiation. The amount of energy transferred by a wave determines the intensity of sound or light.

About the Photo

Sonic Boom This airplane is producing a sonic boom as it moves faster than the speed of sound. As the plane approaches the speed of sound, the Doppler effect causes the sound waves emitted by the plane to pile up in front of it. These wave fronts form a cone-shaped shock wave when they overlap as the plane reaches the speed of sound. Observers on the ground hear a loud boom or crack when the shock wave passes them.

Start-Up Activities

What sound does a ruler make?

Think of the musical instruments you've seen and heard. Some have strings, some have hollow tubes, and others have keys or pedals. Musical instruments come in many shapes and sizes and are played with various techniques. These differences give each instrument a unique sound. What would an instrument made from a ruler sound like?

1. Firmly hold one end of a thin ruler lying flat on a desk, allowing the free end to extend beyond the edge of the desk.
2. Gently pull up on and release the end of the ruler. What do you see and hear?
3. Vary the length of the overhanging portion and repeat the experiment several times.
4. **Think Critically** In your Science Journal, write instructions for playing a song with the ruler. Explain how the length of the overhanging part of the ruler affects the sound.

Scienceonline

Preview this chapter's content and activities at

FOLDABLES™ Study Organizer

Sound and Light Make the following Foldable to help you identify ways in which sound and light are different and alike.

STEP 1 Fold one sheet of paper lengthwise.

STEP 2 Fold into thirds.

STEP 3 Unfold and draw overlapping ovals. Cut the top sheet along the folds.

STEP 4 Label the ovals as shown.

Constructing a Venn Diagram As you read the chapter, list the characteristics unique to sound under the left tab, the characteristics unique to light under the right tab, and those common to both under the middle tab.

Purpose Use the Launch Lab to introduce students to musical pitches. Explain that one of the things they will learn in this chapter is what sound is and what makes sounds different.

L1 ELL AS Auditory-Musical

Preparation Test the rulers that you plan to have students use to be sure that they are flexible enough for the activity.

Materials thin rulers

Teaching Strategy Suggest that students work in pairs. Have one student describe and record the sounds heard while the other student adjusts and plays the ruler.

Think Critically

The longer the extending segment of the ruler, the deeper the pitch.

Assessment

Content Have students listen to the tones that occur at different lengths and then try to play a simple song.

FOLDABLES™ Study Organizer

Tie to Prior Knowledge

Sounds Ask students to name sounds they have heard today. Can they identify what made each sound? Tell them that sounds are made by vibrating objects. Human speech is caused by the vibration of vocal cords in the larynx.

Text Structure Have students study the structure of this section. How are topics introduced? **headings** What technique is used to highlight vocabulary words? **boldface type** Tell students that text structure can help them see, at a glance, what a section covers.

Reading Guide

What You'll Learn

- **Explain** how sound travels through different mediums.
- **Explain** different properties of sound.
- **Discuss** the Doppler effect.
- **Identify** ways sound can be used.

Why It's Important

Sounds are one way that you learn about the world around you.

Review Vocabulary

vibration: rhythmic back-and-forth motion

New Vocabulary

- intensity
- loudness
- decibel
- pitch
- Doppler effect

Sound Waves

An amusement park can be a noisy place. With all the racket of carousel music and booming loudspeakers, it can be hard to hear what your friends say. The many sounds you hear every day are different, but they do have something in common—each sound is produced by an object that vibrates.

Making Sound Waves When an object like the tuning fork in **Figure 1** vibrates, it creates sound waves. Sound waves are compressional waves. Recall that a compressional wave is made of compressions and rarefactions. When an end of the tuning fork moves outward, it forms a compression on that side by pushing the molecules in air together. The compression moves away from the tuning fork as these molecules collide with other molecules in air. When the end of the tuning fork moves back, a rarefaction is formed where the molecules are farther apart. As the tuning fork vibrates, it produces a series of compressions and rarefactions that travels outward. This series of compressions and rarefactions is the sound wave that you hear.

Figure 1 A vibrating tuning fork produces compressions and rarefactions that travel outward from the tuning fork. These compressions and rarefactions form a sound wave.

The Speed of Sound

A sound wave moves in air as collisions between the molecules in air transfer energy from place to place. Sound waves also can move in other materials. The material in which a sound wave moves is called a medium. Just as in air, sound waves travel in solids, liquids, and other gases as a vibrating object transfers energy to the particles in the material. However, sound waves cannot travel in empty space where there are no particles.

The Speed of Sound in Different Materials The speed of a sound wave in a medium depends on the type of substance and whether it is a solid, liquid, or gas. For example, **Table 1** shows the speed of sound in different mediums at room temperature. In general, sound travels slowest in gases and fastest in solids.

Temperature and the Speed of Sound The speed of sound waves also depends on the temperature of the medium. As the temperature of a substance increases, its atoms and molecules move faster. At a higher temperature, atoms and molecules collide with each other more frequently. As a result, sound waves move faster. For example, in air at a temperature of 0°C, sound travels at a speed of 331 m/s, but in air at a temperature of 20°C, sound travels at 343 m/s.

Amplitude and Energy of Sound Waves

Think about the differences among sounds you hear. Some are loud; others are soft. The flute plays high notes, whereas the tuba is much lower. What properties of sound waves cause these differences in the sounds you hear?

Recall that the amount of energy a wave carries corresponds to its amplitude. For a compressional wave, amplitude is related to the density of the particles in the compressions and rarefactions. A vibrating object makes a wave by transferring energy to the medium. More energy is transferred to the medium when the particles of the medium are forced closer together in the compressions and spread farther apart in the rarefactions. Look at **Figure 2**. A sound wave has a higher amplitude and carries more energy when particles in the medium are closer together in the compressions and more spread out in the rarefactions.

Table 1 Speed of Sound in Different Mediums

Medium	Speed of Sound (m/s)
Air (20°C)	343
Cork	500
Water	1,498
Brick	3,650
Aluminum	5,000

Figure 2 The amplitude of a sound wave depends on the density of the particles in the compressions and rarefactions.

Activity

Vocal Cords Have students place their hands on their throats while talking to feel the vibrations caused by their vocal cords.

L2 ELL **KS** Kinesthetic

IDENTIFYING

Misconceptions

Moving Molecules When looking at the pictures of compressions and rarefactions of sound waves, students might think that the molecules travel away from the sound source. Explain that the molecules push on their neighbors and then return to their original positions. Only the energy is transported.

Activity

Ranking Volume Have students bring in various whistles. Have them blow the whistles and rank them from loudest to softest. Afterward, have the students examine the whistles to find out what produced the vibration and what feature caused one whistle to be louder than another. **L2**

ELL **KS** Auditory-Musical

Reading Strategy

Shared Reading Have students read together in small groups as they study Amplitude and Energy of Sound Waves. Many of the terms in this passage, such as amplitude and energy, build upon prior knowledge. Encourage students to help one another recall previous vocabulary terms.

Differentiated Instruction

Hearing Impaired For many of the activities in this section, an alternative way to learn how sound is produced is by feeling the vibrations. When students do the MiniLAB, have them feel the vibrations transmitted through the string to their fingers. Using different types of string and metal objects, they can feel how the vibrations differ for various materials. **KS** Kinesthetic **L1**

Teacher FYI

Sound Speed The speed of sound in a material depends on the material's elasticity and density. Elasticity is the ability of the material to resume its previous shape after being acted on by a force. For example, steel has high elasticity, so sound travels quickly through steel.

Inquiry Lab

Build a Muffler

Purpose to explore sound reduction

Possible Materials shoe box, packing material, corks, waxed paper, cardboard dividers, aluminum foil, sound meter, radio or stereo

Estimated Time two class periods

Teaching Strategies

- Students should make a hole in each end of a shoebox. Noise goes in one end and is measured at the other end.
- Encourage students to test different materials and muffler designs. Students can find muffler designs online. They might try a mazelike passage for the sound waves. Allow students to bring extra materials from home.
- Encourage competition by having a contest to see which group can build the most effective muffler.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Reading Check

Answer Intensity is the amount of energy that flows through an area in a specific amount of time. Loudness is the human perception of this intensity.

Fun Fact

A decibel is one-tenth of a bel, named in honor of Alexander Graham Bell.

Caption Answer

Figure 4 Between an average home and a vacuum cleaner; people normally speak at about 60 dB.

Figure 3 The intensity of a sound wave decreases as the wave spreads out from the source of the sound. The energy of the wave is spread over a larger area as the wave spreads out.

Intensity and Loudness

Imagine you are listening to music from your CD player. Sound waves produced by the CD player travel through the air and transfer energy from the CD player to your ears. The energy that reaches your ears depends not only on the amplitude of the sound waves, but also on how close you are to the CD player. **Figure 3** shows that as you get farther from a source of sound, the energy of the sound waves is spread over a greater area. The amount of energy transferred by a sound wave through a certain area each second is the **intensity** of the sound wave. As sound waves travel away from the source of the sound, the intensity of the waves decreases as the waves spread out. This means that as you get farther from the source, less energy reaches your ears each second.

Loudness When you hear different sounds, you do not need special equipment to know which sounds have greater intensity. Your ears and brain can tell the difference. **Loudness** is the human perception of sound intensity. As the intensity of a sound wave increases, the loudness of the sound also increases.

Reading Check How are intensity and loudness related?

A Scale for Sound Intensity The intensity of sound can be described using a measurement scale. Each unit on the scale for sound intensity is called a **decibel**, abbreviated dB. On this scale, the faintest sound that most people can hear is 0 dB. Sounds with intensity levels above 120 dB may cause pain and permanent hearing loss. During some rock concerts, sounds reach this damaging intensity level. Wearing ear protection, such as earplugs, around loud sounds can help protect against hearing loss. **Figure 4** shows some sounds and their intensity levels in decibels.

Figure 4 The decibel scale measures the intensity of sound.

Identify where a normal speaking voice would fall on the scale.

322 CHAPTER 11 Sound and Light

Active Reading

Bubble Map Using a bubble map helps students start ideas flowing about a given topic. Words are clustered to describe a topic or idea that is studied. Students can use a bubble map to generate ideas for a prewriting or before writing in their journals, or to review for a test. Have students design a bubble map for the concepts about sound discussed in this section. **L2 P**

Teacher FYI

Sound Intensity The intensity of sound decreases as it travels away from a source not only because the waves transfer energy to matter, but also because they radiate out from the source. Sound intensity decreases as $1/r^2$, where r is the distance from the source.

Pitch and Frequency

You might be familiar with the music scale do, re, mi, fa, sol, la, ti, do shown in **Figure 5**. If you were to sing this scale, you would hear the pitch of your voice get higher. **Pitch** is the human perception of the frequency of sound waves. Pitch gets higher as the frequency of the sound waves increases.

Figure 5 Every note has a different frequency, which gives it a distinct pitch.

Describe how pitch changes when frequency increases.

Frequency Frequency is a measure of how many wavelengths pass a particular point each second. For a compressional wave, such as sound, the frequency is the number of compressions or the number of rarefactions that pass by each second. Frequency is measured in hertz (Hz). A frequency of 1 Hz means that one complete wavelength passes by in 1 s.

A healthy human ear can hear sound waves with frequencies from about 20 Hz to 20,000 Hz. The human ear is most sensitive to sounds in the range of 440 Hz to about 7,000 Hz. In this range, most people can hear much fainter sounds than they can at higher or lower frequencies.

Ultrasonic and Infrasonic Waves Most people can't hear sound frequencies above 20,000 Hz, which are called ultrasonic waves. Dogs can hear sounds with frequencies up to about 35,000 Hz, and bats can detect frequencies higher than 100,000 Hz. Even though humans can't hear ultrasonic waves, they have a number of uses. For example, ultrasonic waves directed into the human body are used in medical diagnosis and treatment. Ultrasonic waves are reflected by objects underwater, and can be used to determine the size, shape, and depth of underwater objects.

Infrasonic, or subsonic, waves have frequencies below 20 Hz—too low for most people to hear. These waves are produced by sources that vibrate slowly, such as wind, heavy machinery, and earthquakes. Although you can't hear infrasonic waves, you might feel them as a rumble inside your body.

The Doppler Effect

Imagine that you are standing at the side of a racetrack with race cars zooming past. As they move toward you, the pitches of their engines become higher. As they move away, the pitches become lower. The change in pitch or frequency due to the relative motion of a wave source is called the **Doppler effect**.

Comparing Intensity

Procedure

1. Tie the middle of a 50-cm length of **string** to a metal object such as a **spoon**.
2. Wrap each end of the string around a finger on each hand. Place one of these fingers in each ear.
3. Swing the object so it bumps against a **table** or a **chair**. Note the sound.
4. Take your fingers out of your ears and repeat step 3.

Analysis

1. Compare the sounds you heard in both trials.
2. Compare the intensity of the sound waves that reached your ears in both trials.

SECTION 1 Sound 323

Caption Answer

Figure 5 As frequency increases, pitch becomes higher.

Discussion

Changing Pitch Ask students to describe times when they have heard a sound's pitch change because of the Doppler effect. Some examples are a moving police or fire engine siren, a school bell when they are moving toward or away from it quickly, and a train's whistle. Encourage students to listen for other examples of the Doppler effect over the next few weeks and to describe them to the class.

Purpose Students listen to sounds through different mediums. **L1**

ELL **AS** Auditory-Musical

Materials metal objects such as a spoon, 1.5 m of string, chair or table

Teaching Strategy Suggest students try a variety of metal objects to obtain different sounds.

Analysis

1. Possible answer: the sound is louder and more muffled when your fingers are in your ears.
2. The intensity is greater with fingers in your ears.

Assessment

Content How would the intensity of the sound that travels through the string depend on the length of the string? **The intensity would decrease as the string became longer.** Use PASC, p. 89.

Science Journal

Feeling Pitch Have students place their hands gently over their necks and sing the musical scale "do re mi fa so la ti do." Have them write their observations in their Science Journals. They should be able to tell that their vocal cords vibrate differently as they go up the scale. **L2** **LS**

Kinesthetic

Differentiated Instruction

English-Language Learners Use the musical scale to help students understand the relationship between frequency and pitch. Have someone play the notes on a guitar or other musical instrument as you point them out on the staff lines. Be sure students understand that as the notes go up the scale, the frequency and pitch increase.

Visual Learning

Figure 6 Remind students that the sound waves emitted by the car in the figure don't change. It is only the frequency at which they reach the flagger that changes. The car's driver hears no change in pitch at all. Have students draw circles representing sound waves to show how the Doppler effect increases if the speed of the sound source increases. **L2 Visual-Spatial**

Quick Demo The Doppler Effect

Materials sponge ball, small electric buzzer, battery, tape

Estimated Time 15 minutes

Procedure Cut a small opening in the side of the sponge ball. Place the small electric buzzer connected to the battery inside the opening and tape the opening shut. Throw the ball from the front to the back of the room. The increased and decreased pitches caused by the Doppler effect should be audible.

Red Shift The light from most galaxies is shifted toward the red end of the spectrum because, as these galaxies are moving away from Earth, their light waves become "stretched out." This is known as the red shift. The stretching of the light waves is caused by the Doppler effect.

✓ Reading Check

Answer The pitch decreases.

Figure 6 The Doppler effect occurs when the source of a sound wave is moving relative to a listener.

A The race car creates compression A, which spreads through the air in all directions from the point where it was created.

B The car is closer to the flagger when it creates compression B. Compressions A and B are closer together in front of the car, so the flagger hears a higher-pitched sound.

A Moving Source of Sound As a race car moves, it produces sound waves in the form of compressions and rarefactions. In **Figure 6A**, the race car creates a compression, labeled A. Compression A moves through the air toward the flagger. By the time compression B leaves the race car in **Figure 6B**, the car has moved forward. Because the car has moved since the time it created compression A, compressions A and B are closer together in front of the car than they would be if the car had stayed still. Because the compressions are closer together, more compressions pass by the flagger each second than if the car had been at rest. As a result, the flagger hears a higher pitch. **Figure 6B** also shows that the compressions behind the moving car are farther apart, resulting in a lower frequency. The flagger hears a lower pitch after the car passes.

A Moving Listener You also can hear the Doppler effect when you are moving past a sound source that is standing still. Suppose you were riding in a school bus and passed a building with a ringing bell. The pitch would become higher as you approached the building and lower as you rode away from it. The Doppler effect happens any time the source of a sound is changing position relative to the listener. It occurs no matter whether it is the sound source or the listener that is moving. The faster the change in position, the greater the change in frequency and pitch.

✓ Reading Check

How does pitch change if you are moving away from a sound source?

Curriculum Connection

History When a jet travels faster than the speed of sound, the sound waves it produces trail behind as a cone of pressure disturbances in the air. This Mach cone might be heard as a loud sonic boom

as the jet passes. Have students research the first human-made sonic boom. Test pilot Chuck Yeager was the first person to break the sound barrier in an airplane and cause a sonic boom. He did this on October 14, 1947. **L2**

Using Sound

When sound waves strike an object, they can be absorbed by the object, transmitted through the object, or reflected from the object. By detecting the sound waves reflected from an object, the size, shape, and location of an object can be determined.

Echolocation and Sonar Some species of bats, as well as dolphins, whales, and other animals, use sound waves to detect their prey. Echolocation is the process of locating objects by emitting sounds and detecting the sound waves that reflect back.

Sonar is a system that uses the reflection of underwater sound waves to detect objects. First, a sound pulse is emitted underwater. The sound waves travel in the water and are reflected when they strike an object, such as a fish or a ship. An underwater microphone detects the reflected waves. Because the speed of sound in water is known, the distance to the object can be calculated by measuring how much time passes between when the sound pulse is emitted and when the reflected signal is received.

Scienceonline

Topic: Sonar

Visit fl.gpscience.com for Web links to information about ways sonar is used.

Activity Research to find out the different types of sonar. Make a poster that describes active and passive sonar.

Use Science Words

Word Origin Have students find what the letters of the word sonar stand for and explain why this is an accurate description. **Sonar** stands for sound navigation and ranging. This is accurate because sonar is the use of sound to navigate and determine the distance or range to objects. L2

Reading Check

Answer by emitting a sound pulse and measuring the time for the pulse to travel to the object and return

Applying Math

Math Standards

National: 1, 2, 9
Florida: MA.B.1.4.2

Teaching Strategy

Be sure students understand that the reason the equation is divided by 2 is that the distance to the object is one-half the distance that the sound travels, because the sound must travel to the object and back.

Answers to Practice Problem

1,500 m/s

Applying Math Solve a Simple Equation

USING SONAR A sonar pulse returns in 3.00 s from a sunken ship that is directly below. Find the depth of the ship if the speed of the pulse is 1,500 m/s. *Hint:* The sonar pulse travels a distance equal to twice the depth of the ship, so use the equation $d = st/2$ to find the depth.

IDENTIFY known values and the unknown value

Identify the known values:

speed of sound in water $s = 1,500 \text{ m/s}$
time for round trip $t = 3.00 \text{ s}$

Identify the unknown value:

depth of the ship $d = ? \text{ m}$

SOLVE the problem

Substitute the known values $s = 1,500 \text{ m/s}$ and $t = 3.00 \text{ s}$ into the equation for depth:

$$d = \frac{st}{2} = \frac{(1,500 \text{ m/s})(3.00 \text{ s})}{2} = \frac{1}{2}(4,500 \text{ m}) = 2,250 \text{ m}$$

CHECK your answer

Check your answer by dividing the distance by the time and multiplying by 2. The result should be the speed of sound given in the problem.

Practice Problems

Find the speed of a sonar pulse that returns in 2.0 s from a ship at a depth of 1,500 m. For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

Teacher FYI

There are three types of sonar systems. An active sonar system sends sound waves toward a target and analyzes the reflected waves. A passive sonar system doesn't emit sound waves; it simply detects and analyzes sounds made by a target. Sonar systems can also be used for communication, as is done by naval and oceanography ships, for example.

Differentiated Instruction

Learning Disabled Go through the Applying Math feature step by step. Make sure the student understands the reason for each step in the problem. Watch to be sure the student is performing the calculations correctly.

Post Reading

Extended Research Have students research how the Doppler effect is used to predict storms. What advantage does Doppler radar have over conventional radar? Invite a meteorologist to provide a more thorough explanation to the class.

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Have students use their hands to demonstrate the motion of particles when sound waves pass through them. Ask students to show the movement of sound waves through air and then through aluminum. [L2]

Reteach

Sound Wave Properties Place a clear, shallow container of water on top of an overhead projector to demonstrate various properties of waves. For example, touch the water with vibrating tuning forks to show low and high frequencies. Move a vibrating tuning fork along the surface to show the Doppler effect. [L2]

Assessment

Process Strike a tuning fork and place its handle against various surfaces, such as a wooden desk, a book, a metal surface, and a wall. For each surface, have students explain why the amplified sound is loud or soft. *Sounds will be louder for larger, denser, and stiffer surfaces.* Use **Performance Assessment in the Science Classroom**, p. 89 [L2]

Figure 7 Ultrasonic waves are directed into a pregnant woman's uterus to form images of her fetus.

Ultrasound in Medicine High-frequency sound waves can also be used to remove dirt buildup on jewelry and glassware. One of the most important uses of ultrasonic waves, though, is in medicine. Using special instruments, medical professionals can send ultrasonic waves into a specific part of a patient's body. Reflected ultrasonic waves are used to examine different body parts and to detect and monitor certain types of heart disease and cancer. Ultrasound imaging also is used to monitor the development of a fetus, as shown in **Figure 7**. However, ultrasound does not produce good images of the bones and lungs, because hard tissues and air absorb the ultrasonic waves instead of reflecting them.

High-frequency sound waves can be used to treat certain medical problems. For example, sometimes small, hard deposits of calcium compounds or other minerals form in the kidneys, making kidney stones. In the past, physicians had to perform surgery to remove kidney stones. Now ultrasonic treatments are commonly used to break them up instead. Bursts of ultrasound create vibrations that cause the stones to break into small pieces that can easily pass out of the body with the urine. A similar treatment is available for gallstones.

section 1 review

Summary

Sound Waves

- Sound waves are compressional waves that are produced by vibrating objects.
- Sound usually travels fastest in solids and slowest in gases.
- Sound travels faster as the temperature of the medium increases.

Properties of Sound

- The amplitude of sound waves increases as the density of particles increases in the compressions and decreases in rarefactions
- Loudness is the human perception of the intensity of sound waves. Pitch is the human perception of the frequency of sound waves.
- The Doppler effect is the change in the frequency of a sound wave when the source of the sound is moving relative to a listener.

Self Check

1. **Explain** how sound travels from your vocal cords to your friend's ears when you talk.
2. **Explain** how the loudness of a sound wave depends on the intensity of the sound wave.
3. **Draw and label** a diagram that explains the Doppler effect.
4. **Describe** at least three uses of ultrasonic technology in medicine.
5. **Think Critically** How could sonar technology be used to locate deposits of oil and minerals?

Applying Math

6. **Calculate Time** How long would it take a sound wave from a car alarm to travel 1.0 km in air if the air temperature were 0°C?
7. **Calculate Distance** If sound travels in the ocean with a speed of 1,500 m/s, how far will a sonar pulse travel in 45 s?

section 1 review

1. Your vocal cords create compressions and rarefactions in air molecules that travel out in all directions.
2. Loudness is related to how the human ear and brain interpret intensity. As a sound wave's intensity increases so does the loudness.
3. Check students' work.
4. Possible answers: producing sonograms of a developing fetus, breaking up kidney stones, breaking up gall stones.
5. Sonar waves could be transmitted through the ground and reflected from oil deposits. They also would travel with a different speed in oil and mineral deposits than in the surrounding ground.
6. $1,000 \text{ m} / (331 \text{ m/s}) = 3.02 \text{ s}$
7. $1,500 \text{ m/s} \times 45 \text{ s} = 37,500 \text{ m} = 37.5 \text{ km}$

Reflection and Refraction of Light

Reading Guide

What You'll Learn

- **Describe** how light waves interact with matter.
- **Explain** the difference between regular and diffuse reflection.
- **Define** the index of refraction of a material.
- **Explain** why a prism separates white light into different colors.

Why It's Important

The images you see every day are due to the behavior of light waves.

Review Vocabulary

visible light: an electromagnetic wave with wavelengths between about 400 and 700 billionths of a meter

New Vocabulary

- opaque
- translucent
- transparent
- index of refraction

The Interaction of Light and Matter

Look around your darkened room at night. You know that some of the objects are brightly colored, but they look gray or black in the dim light. Turn on the light, and you can see all the objects in the room clearly, including their colors. What you see depends on the amount of light in the room and the color of the objects. For you to see an object, it must reflect or emit some light that reaches your eyes.

Absorption, Transmission, and Reflection Objects can absorb light, reflect light, and transmit light—allow light to pass through them. The type of matter in an object determines the amount of light it absorbs, reflects, and transmits. For example, the **opaque** material in the top candleholder in **Figure 8** only absorbs and reflects light—no light passes through it. As a result, you cannot see the candle inside. Materials that allow some light to pass through them, like the material of the middle candleholder in **Figure 8**, are described as **translucent**. You cannot see clearly through translucent materials.

Transparent materials, such as the bottom candleholder in **Figure 8**, transmit almost all the light striking them, so you can see objects clearly through them. Only a small amount of light is absorbed and reflected by transparent materials.

Figure 8 These candleholders interact with light differently.

A Opaque

B Translucent

C Transparent

Section Focus Transparency Knight Light

The colors of stained glass are metallic oxides (combinations of different metals and oxygen), but the beautiful colors you see aren't due solely to the coloring in the glass. It's the light passing through the glass that reaches your eyes. The natural light changes from morning to night, even from moment to moment. Our perception of stained glass changes with the light.

1. Where can you see totally through this window?
2. Where can you see light but not what's on the other side of the window?

L2 What do you think causes these differences?

Reading Preview

Tie to Prior Knowledge

Water Distortion Ask how students' feet appear if they stand in a swimming pool with their heads above the water. The feet look distorted because the speed of light in water is different from the speed of light in air. This causes light to change direction when it enters water at an angle.

Make Connections Pour some water in a translucent glass and a transparent glass. Ask students which glass is easier to see through. **transparent glass** Explain that some objects transmit more light than others. Which glass allows the most light to pass through? **transparent glass**

Make a Model

Law of Reflection Have students roll a ball at an angle toward a wall to model light striking a surface. The ball, like light, obeys the law of reflection. The incident and reflected angles are the same.

IDENTIFYING

Misconceptions

Reflecting Light Some students may think that only special materials, such as mirrors and shiny metals, reflect light. To correct this misconception, darken the room and have students shine a flashlight on the wall, a mirror, a book, a desk, and other surfaces. They should realize that all of the surfaces reflect light.

Activity

Reflective Foil Distribute two pieces of aluminum foil to small groups of students. Be careful not to wrinkle the foil. Have students crumple and then flatten one of their foil pieces. Ask which piece has a more regular reflection and why. The unwrinkled foil; its surface is smoother, so the normal is pointing in about the same direction at all points, meaning that the angles of incidence and reflection will be about the same everywhere for parallel light waves. L1

✓ Reading Check

Answer light waves reflecting in many directions after striking a rough surface or being deflected by small particles

Caption Answer

Figure 10 Light rays obey the law of reflection at each point on the surface, but because the rough surface is sloped in different directions at each location, the parallel light rays that strike the rough surface are reflected in different directions.

Figure 9 According to the law of reflection, light is reflected so that the angle of incidence always equals the angle of reflection.

reflected. Light reflected from any surface—a mirror or a sheet of paper—obeys this law.

Regular and Diffuse Reflection Why can you see your reflection in a store window but not in a sheet of paper? The answer has to do with the smoothness of the surfaces. A smooth, even surface such as a pane of glass produces a sharp image by reflecting parallel light waves in only one direction. Reflection of light waves from a smooth surface is regular reflection. To cause a regular reflection, the roughness of a surface must be less than the wavelengths it reflects. A sheet of paper has an uneven surface that causes incoming parallel light waves to be reflected in many directions, as shown in **Figure 10**. Reflection of light from a rough surface is diffuse reflection.

Scattering Diffuse reflection is a type of scattering that occurs when light waves traveling in one direction are made to travel in many different directions. Scattering also occurs when light waves traveling through the air reflect off small particles. An example is light scattering off the small water droplets that make up a cloud. Scattering causes the cloud to appear white, even though the droplets are transparent.

✓ Reading Check What is scattering of light?

Figure 10 A sheet of paper has an uneven surface that produces a diffuse reflection.

Explain Use the law of reflection to explain why a rough surface causes parallel light waves to be reflected in many directions.

Differentiated Instruction

Visually Impaired Allow students to feel different grades of sandpaper. Explain that unless the light is absorbed, light reflects more evenly off the smoother surfaces. Students should realize that even surfaces that seem smooth can have microscopic roughness that prevents them from being good reflectors.

Teacher FYI

Index of Refraction The index of refraction of a material is the ratio of the speed of light in a vacuum to the speed of light in the material. The indices of refraction (n) in some common materials are: water, $n = 1.33$; glass, $n = 1.52$; diamond, $n = 2.42$.

 **Logical-Mathematical**

Refraction of Light

What occurs when a light wave passes from one material to another—from air to water, for example? Recall that refraction is caused by a change in the speed of a wave when it passes from one material to another. If the light wave is traveling at an angle to the boundary between the materials and the speed of light is different in the two materials, the wave will be bent, or refracted.

Reading Check Why does refraction occur?

The Index of Refraction The amount of bending that takes place depends on the speeds of light in both materials. The greater the change in speed, the more the light will be bent as it passes at an angle from one material to the other. **Figure 11** shows an example of refraction. Every material has an **index of refraction** which is the ratio of the speed of light in a vacuum to the speed of light in the material. The index of refraction indicates how much the speed of light is reduced in the material compared to its speed in empty space.

The larger the index of refraction, the more light is slowed down in the material. For example, because glass has a larger index of refraction than air, light moves more slowly in glass than air. The index of refraction is usually largest for solids and smallest for gases.

Prisms A sparkling glass prism hangs in a sunny window, refracting the sunlight and projecting a colorful pattern onto the walls of the room. How does the refraction of light create these colors? The spectrum of colors is produced because the speed of light in a material also depends on the wavelength of the light. In a glass prism, light waves with longer wavelengths, such as red light waves, are slowed less than light waves with shorter wavelengths, such as blue light waves.

Figure 12 shows what occurs when white light passes through a prism. White light, such as sunlight, is made up of light waves with range of wavelengths from red to blue. The triangular prism refracts the light twice—once when it enters the prism and again when it leaves the prism and reenters the air. Because the longer wavelengths of light are slowed less than the shorter wavelengths are, red light is bent the least. As a result of these different amounts of bending, the different colors are separated when they emerge from the prism.

Figure 11 The spoon looks broken because light waves are refracted as they change speed when they pass from the water to the air.

Figure 12 Refraction causes a prism to separate a beam of white light into different colors.

Reading Check

Answer Refraction occurs when a light wave changes speed as it passes at an angle from one material to another.

Discussion

Index Matching Ask students to imagine light traveling at an angle from one material into another with no refraction. What would this imply? **The materials have the same index of refraction.**

Use an Analogy

Bouncing Ball Tell students that reflecting light is similar to a ball bouncing off a wall. If you roll the ball directly toward the wall, it will bounce back straight toward you. If you roll it at an angle, it will bounce so that the angle between the incoming ball and the wall equals the angle between the outgoing ball and the wall. Allow the students to roll a ball at a wall from different angles. **L2 ELL LS Kinesthetic**

Fun Fact

Rainbows are formed when sunlight is refracted by water droplets in the air. If light traveled at the same speed in water and air, there would be no rainbows.

Visual Learning

Figure 11 Emphasize that the spoon appears to be broken because of the different paths the light takes. Light from the top of the spoon travels straight through the air. Light from the bottom of the spoon is bent when it passes from the water to the air. Have students sketch the paths the light takes in this picture. **L2 ELL LS Visual-Spatial**

Reading Strategy

Cooperative Groups Have students recreate the activity shown in **Figure 11**. Place students in groups of four, and give each group a beaker of water and a spoon. Have one student read the directions, one student perform the experiment, one student take notes, and one student explain to the class what the group learned about refraction.

Post Reading

Summarize Have students summarize the law of reflection and the index of refraction in their Science Journals. Ask students to apply each concept to an everyday situation, such as light reflecting off a mirror.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Draw different surfaces on the board and light rays approaching them. Make some rough and some smooth. Have the students copy the surfaces and draw light diagrams for them.

Reteach

Ray Diagrams Ask students to draw ray diagrams showing light coming from a flashlight, being refracted as it moves from air to water, being reflected off an object in the water, being refracted as it moves from the water to air, and then hitting an observer's eye.

Assessment

Process Show the class various materials and have students classify them as opaque, transparent, or translucent.

Figure 13 Mirages result when air near the ground is much warmer or cooler than the air above. This causes light waves reflected from an object to refract, creating one or more additional images.

Mirages When you're traveling in a car, you might see what looks like a pool of water on the road ahead. As you get closer, the water seems to disappear. You've seen a mirage—an image of a distant object produced by the refraction of light through air layers of different densities. Mirages result when the air at ground level is much warmer or cooler than the air above, as shown in **Figure 13**. The density of air increases as air cools and light waves move slower in cooler air than in warmer air. As a result, light waves are refracted as they pass through air layers with different temperatures.

section 2 review

Summary

Light and Matter

- The amount of light that is absorbed, reflected, or transmitted depends on the material making up the object.

Reflection of Light

- Light waves always obey the law of reflection: the angle of incidence equals the angle of reflection.
- Regular reflection causes parallel light waves to be reflected in only one direction.
- Diffuse reflection causes parallel light waves to be reflected in many directions.
- Scattering occurs when light waves are reflected and travel in many different directions.

Refraction of Light

- Refraction occurs when a light wave changes speed in moving from one material to another.
- The index of refraction of a material indicates how much light slows down in the material.

Self Check

- Compare and contrast** opaque, transparent, and translucent materials. Give one example of each.
- Discuss** why you can see your reflection in a smooth piece of aluminum foil but not in a crumpled ball of foil.
- Infer** what happens to light waves that are reflected off dust particles in the air.
- Explain** what happens to white light when it passes through a prism.
- Think Critically** Suppose a material has the same index of refraction as water. How would a light wave change direction as it traveled from water into this material?

Applying Math

- Find an Angle** A light wave strikes a mirror at an angle of 42° from the surface of the mirror. What angle does the reflected wave make with the normal?
- Find an Angle** A light wave reflects from a mirror at 27° from the normal. What was the angle between the mirror and the incident wave?

section 2 review

- Transparent materials (clear glass) transmit almost all visible light, opaque materials (a wall) transmit no visible light, and translucent materials (waxed paper) transmit some visible light.
- Smooth surfaces reflect parallel

rays in one direction, but rough surfaces reflect parallel rays in many directions.

- Light strikes the dust particles at different angles, causing the light to scatter in many directions.
- The different wavelengths of light

that pass through the prism are bent by different amounts, causing a rainbow effect.

- There would be no change in direction.
- An incident angle of 42° to the surface corresponds to an angle of 48°

to the normal. The reflected angle, then, will also be 48° to the normal.

- 63°

M.A.B.2.4.1

Mirrors, Lenses, and the Eye

Reading Guide

What You'll Learn

- **Describe** how images are formed by three types of mirrors.
- **Explain** how convex and concave lenses form images.
- **Explain** how the human eye enables you to see.
- **Describe** how lenses are used to correct vision problems.

Why It's Important

Mirrors and lenses are used in optical instruments such as cameras and telescopes.

Review Vocabulary

reflection: the process of changing direction after striking a surface

New Vocabulary

- plane mirror
- concave mirror
- convex mirror
- convex lens
- concave lens

Light Rays

Light sources send out light waves in all directions. These waves spread out like ripples on the surface of water spread out from the point of impact of a pebble. You can think of the light coming from the source as being many narrow beams of light traveling in all directions. Each narrow light beam is called a light ray.

Mirrors

A mirror is any surface that produces a regular reflection. A pool of still water, a metal pan, and even the back of a shiny spoon can be mirrors. Mirrors can be flat, curved inward, or curved outward.

Plane Mirrors A flat, smooth mirror is a **plane mirror**. When you look in a plane mirror, your image appears upright. If you stand 1 m from the mirror, your image appears 1 m behind the mirror, or 2 m from you. In fact, your image is what a friend standing 2 m from you would see. **Figure 14** shows how your image is formed. First, light rays from a light source strike you. Every point that is struck by the light rays reflects these rays so they travel outward in all directions. If your friend were looking at you, these reflected light rays coming from you would enter her eyes so she could see you. However, if a mirror is placed between you and your friend, light rays are reflected from the mirror back to your eyes.

Figure 14 Seeing an image of yourself in a mirror involves two sets of reflections: light rays are reflected from you and then are reflected by the mirror.

Section Focus Transparency Fun-House Mirrors Chapter 11

If you've ever been to an amusement park or fair, you may have seen mirrors like this one. These full-length mirrors provide distorted images of the viewer. They're often found in the fun-house along with other amusing exhibits.

1. How does the image made by a fun-house mirror differ from that of an ordinary mirror? How are they the same?

L2 Why does a fun-house mirror provide such a different image from an ordinary mirror?

Reading Preview

Tie to Prior Knowledge

Reflection Distortion Ask students if they have ever noticed a distorted reflection in a shiny, rounded surface, such as a doorknob. In this section, students will learn how the shape of a mirror determines the type of reflection they see.

Concept Maps Have students make concept maps about the different types of mirrors discussed in this section. The first, center oval should be labeled *Mirror*. The second row of ovals should be labeled *Plane Mirror*, *Concave Mirror* and *Convex Mirror*. The third row of ovals should contain characteristics of each type of mirror.

Use Science Words

Word Meaning Have students explain why a flat mirror is called a plane mirror. In mathematics, the word *plane* refers to a flat surface that extends infinitely in all directions, so the word *plane* is frequently used as a synonym for flat.

Caption Answers

Figure 15 The farther you are from the mirror, the smaller your image will appear.

Figure 16 Check students' answers.

Activity

Concave Mirrors Allow students to experiment with concave mirrors to observe how focusing the image depends on the object's distance from the mirror. Have them also observe how the image varies as they move the mirror from side to side. [L2]

ELL LS Visual-Spatial

Teacher FYI

Spherical Aberration Spherical mirrors can't produce perfectly focused images because rays from their outer edges focus slightly closer to the mirror than rays from the middle. To avoid this effect, large mirrors typically have a parabolic shape, which allows all of the rays to converge at the same point.

Figure 15 Your brain interprets the light rays reflected by the mirror as coming from a point behind the mirror.

Infer how the size of your image in a plane mirror depends on your distance from the mirror.

Virtual and Real Images The formation of an image by a plane mirror is shown in **Figure 15**. Your brain assumes that light rays travel in a straight line. As a result, rays that enter your eyes seem to come from behind the mirror. This makes the image seem to be behind the mirror. However, no light rays actually pass through the place where the image seems to be located. This type of image is called a virtual image. Plane mirrors always form virtual images. If light rays from an object pass through the location of the image, the image is called a real image. Curved mirrors can form both real and virtual images.

Concave Mirrors If the surface of a mirror is curved inward, it is called a **concave mirror**, as shown in **Figure 16**. The optical axis is an imaginary straight line drawn perpendicular to the surface of the mirror at its center. Every light ray traveling parallel to the optical axis is reflected through a point on the optical axis called the focal point. The distance from the center of the mirror to the focal point is called the focal length.

The image formed by a concave mirror depends on the location of the object relative to the focal point. **Figure 16** shows a candle located more than twice the focal length from the mirror. Although many light rays come from each point on the candle, only two rays from the same point are shown. Ray A passes through the focal point and then reflects off the mirror moving parallel to the optical axis. Ray B travels parallel to the optical axis before reflecting off the mirror and passing through the focal point. The point where the two rays meet is the location of the image of the original point on the candle. The image formed is a real image because light rays from the candle pass through the place where the image is located.

Figure 16 Rays A and B start from the same place on the candle, travel in different directions, and meet again on the reflected image.

Diagram how two other points on the image of the candle are formed.

Visual Learning

Figure 16 Although only two rays are shown in the figure, students should realize that rays are reflected in all directions. Have students work in pairs and discuss how rays from all parts of the candle are reflected off the concave mirror to form an image. [L1] ELL LS Visual-Spatial

Active Reading

Write-Draw-Discuss This strategy encourages students to participate actively in reading and lectures, assimilating content creatively. Have students write about an idea, clarify it and then make an illustration or drawing. Ask students to share responses with the class and display several examples. Have students Write-Draw-Discuss about convex and concave mirrors.

Images Produced by a Concave Mirror

When an object is between one and two focal lengths from a concave mirror, the image is real, inverted, and larger than the object. An object closer than one focal length from a concave mirror produces a virtual image that is upright and larger than the object. No image is produced if the object is located at the focal point.

Convex Mirrors When you are in a store, look up toward one of the back corners or at the end of an aisle to see if a large, rounded mirror is mounted there. You can see a large area of the store in such a mirror. A mirror that curves outward like the back of a spoon is called a **convex mirror**. Light rays that hit a convex mirror diverge, or spread apart, after they are reflected. **Figure 17** shows how the rays from an object are reflected by a convex mirror to form an image. The reflected rays diverge and never meet, so a convex mirror forms only a virtual image. The image also is upright and smaller than the actual object is.

Reading Check Describe the image formed by a convex mirror.

Lenses

What do your eyes have in common with cameras, eyeglasses, and microscopes? Each of these contains at least one lens. A lens is a transparent object with at least one curved surface that causes light rays to refract. The image that a lens forms depends on the shape of the lens. Like curved mirrors, lenses can be convex or concave.

Convex Lenses A **convex lens** is thicker in the middle than at the edges. Its optical axis is an imaginary straight line that is perpendicular to the surface of the lens at its thickest point. When light rays approach a convex lens traveling parallel to its optical axis, the rays are refracted toward the center of the lens, as in **Figure 18**. Light rays traveling along the optical axis are not bent at all. All light rays traveling parallel to the optical axis are refracted so they pass through a single point, which is the focal point of the lens. The less curved the sides of the lens, the less light rays are bent. As a result, lenses with flatter sides have longer focal lengths. **Figure 19** on the next page shows that convex lenses can form either real or virtual images.

Figure 17 A convex mirror forms a reduced, upright, virtual image.

Figure 18 Convex lenses are thicker in the middle than at the edges. Light rays that are parallel to the optical axis are refracted so that they pass through the focal point. A light ray that passes through the center of the lens is not refracted.

Quick Demo Mirror Reflections

Materials laser pointer; plane, concave, and convex mirrors

Estimated Time five minutes

Purpose Use the laser pointer to show light reflecting from a plane mirror, a concave mirror, and a convex mirror. Students should notice the difference in reflections from the three mirrors. Remind them that the law of reflection applies to each mirror. **WARNING:** *Never direct a laser pointer toward someone's eyes. Be sure the reflected light does not point toward someone's eyes.* [L2] [ELL] [IS] **Visual-Spatial**

Reading Check

Answer upright, smaller, and virtual

Discussion

Lenses v. Mirrors What is the primary difference between lenses and mirrors? **Mirrors reflect light, whereas lenses transmit light.**

Activity

Convex Lenses Distribute to your class some convex lenses of varying focal lengths. Show students how to find the focal length of a lens by focusing the clearest possible image of an overhead light on a white piece of paper (held by a partner) and measuring the distance from the paper to the lens. [L2] [IS] **Visual-Spatial**

LAB DEMONSTRATION

Purpose to observe images with convex and concave lenses

Materials concave and convex lenses, optical bench and lens holders, tape, pencil

Preparation Place a convex lens in a holder on the bench. Using tape, mark one and two focal lengths.

Procedure Hold a pencil more than two focal lengths from the lens, between one and two focal lengths from the lens, and less than one focal length from the lens. At each position, have students look through the lens. Repeat using a concave lens.

Expected Outcome The convex lens

diverges light. Light through a concave lens depends on image distance.

Assessment

Ask why the image flips when the pencil moves closer than one focal length to the convex lens. **The light rays no longer converge.**

Visualizing Images Formed by a Convex Lens

Have students examine the pictures and read the captions. Then ask the following questions.

To which type of mirror is a convex lens most similar? Describe the similarities. **Concave mirror**; both cause light rays to converge and form different types of images depending on the position of the object relative to the focal point.

How does the position of the focal point change as the lens becomes more curved? **It moves closer to the lens.** Less curved? **It moves away from the lens.**

Activity

Have students create tables describing the images formed by lenses. The columns should be labeled *Lens Shape*, *Location of Object*, *Type of Image*, including the three subheadings *Virtual/Real*, *Upright/Inverted*, and *Size*. For example, one row for convex lenses would include the entries: convex, object beyond 2 focal lengths from the lens, real, inverted, and smaller than object, respectively.

Figure 19

A convex lens can form images that are real or virtual, enlarged or reduced, and upright or inverted. Just as for a concave mirror, the type of image formed by a convex lens depends on the location of the object relative to the focal point of the lens.

If the object is more than two focal lengths from the lens, the image formed is real, inverted, and smaller than the object. As the object moves farther from the lens, the image becomes smaller.

If the object is between one and two focal lengths from the lens, the image formed is real, inverted, and larger than the object. As the object moves closer to the focal point, the image becomes larger.

If the object is less than one focal length from the lens, the image is virtual, upright, and larger than the object. The image is virtual because the light rays from the object diverge after they pass through the lens. The image becomes smaller as the object moves closer to the lens.

Reading Strategy

Clarify Illustrations As you read aloud the captions in **Figure 19**, have students use their fingers to trace the path of light from the object to the image. Ask them to raise their hands if any step along the path is unclear. Pause and clarify the concept for students.

Concave Lenses A **concave lens** is thinner in the middle and thicker at the edges. As shown in **Figure 20**, light rays that pass through a concave lens bend away from the optical axis. The rays spread out and never meet, so a real image is never formed. The image is always virtual, upright, and smaller than the object is. Concave lenses are used in some types of eyeglasses and some telescopes. Concave lenses usually are used in combination with other lenses.

Reading Check What type of image is formed by a concave lens?

The Human Eye

What determines how well you can see the words on this page? If you don't need eyeglasses, the structure of your eye gives you the ability to focus on these words and other objects around you. Look at **Figure 21**. Light enters your eye through a transparent covering on your eyeball called the cornea. The cornea causes light rays to bend so that they converge. The light then passes through an opening called the pupil. Behind the pupil is a flexible convex lens. Muscles attached to the lens change its shape to help focus light, forming a sharp image on your retina. The retina is the inner lining of your eye. The retina contains light-sensitive cells that convert an image into electrical signals. These signals then are carried along the optic nerve to your brain to be interpreted. With this complex structure, the human eye is capable of seeing clearly in bright and dim conditions, focusing on both near and far objects, and also detecting colors.

Figure 21 The cornea and lens in your eye bend light rays so that a sharp image is formed on the retina.

Figure 20 A concave lens refracts light rays so they spread out away from the optical axis.
Classify Is a concave lens most like a concave mirror or a convex mirror?

Eye Doctors Optometrists and ophthalmologists treat many different eye problems. They often use advanced technology to diagnose and correct malfunctioning parts of the eye. Research an eye problem and how it is treated. Write a paragraph describing what parts of the eye are affected by the problem and how doctors correct it.

Reading Check

Answer virtual, upright, smaller than the object

Caption Answer

Figure 20 Convex mirror; both cause light to diverge and produce virtual images.

Eye Doctors A main distinction between the two professions is that ophthalmologists perform eye surgery while optometrists do not. Possible student topics include: keratoconus (deformed cornea, treated with glasses and contacts or cornea transplant), cataracts (cloudy lens, treated by implanting artificial lens), macular degeneration (affects the retina, often treated with laser surgery)

Quick Demo Exploring an Eye

Materials model of a human eye
Estimated Time 30 minutes
Procedure Allow students to explore the model and observe the cornea, lens, and retina. Have students explain how light enters through the cornea and is refracted onto the retina. Point out the muscles that adjust the size of the lens, and note the optic nerve, which carries information about images to the brain. **L2** **IS** **Visual-Spatial**

Use Science Words

Word Origin Lenses were named because of the resemblance of an eye's lens to a small legume called a lentil. The Latin word for lentil is *lenticula*. Bring lentils to class so students can see the resemblance in shape. **L2** **IS** **Visual-Spatial**

Differentiated Instruction

Learning Disabled If students have trouble remembering which type of curved surface is concave and which is convex, tell them to remember that a concave surface is curved inward like a cave. To practice using this mnemonic, have them name some curved surfaces and identify them as concave or convex.

Teacher FYI

Animal Eyes Vertebrates, cephalopods, and some spiders have camera-like eyes with variable focusing. Worms, mollusks, and some crustaceans and insects have simple eyes that can distinguish light and dark. Most arthropods have compound eyes, with many separate lenses, each of which forms its own image.

Mini LAB

 Video Lab available.

Purpose to observe how an object's distance from a convex lens affects its image **L1** **ELL**

Visual-Spatial

Materials glass test tube with stopper, water, paper

Teaching Strategy Print the words in capital letters.

Analysis

1. When the tube is on the paper, the words are slightly magnified. About 1 cm away, beyond the focal point, SULFUR is inverted, but DIOXIDE seems unchanged because it is symmetrical.
2. The upright image is virtual. The inverted image is real.

Assessment

Content Ask whether a magnifying lens could invert images. Yes, if it is far enough away from the object.

Visual Learning

Figure 22 Be sure students understand that the light rays in the image are shown extending past the eyeball only to show where the focal point is located. In reality, the rays are blocked by the retina before they can focus. Also point out the shape of the lens of the eye. Although the cornea is mostly responsible for refracting the light, the lens is able to change shape. This enables a person to slightly change the amount of refraction so that light from both near and far objects can be focused.

Fun Fact

Eyeglasses were used as early as the thirteenth century, and some crystals were used even earlier as natural magnifying glasses by the Greeks and Arabs.

Mini LAB

Experimenting with Focal Lengths

Procedure  

1. Fill a glass test tube with water and seal it with a lid or stopper.
2. Type or print *SULFUR DIOXIDE* in capital letters on a piece of paper.
3. Set the test tube horizontally over the words. Record your observations.
4. Hold the tube at several heights above the words. Record your observations.

Analysis

1. Describe how the words changed as the height of the test tube increased.
2. Classify the image at each height as real or virtual.

Brightness and Intensity The human eye can adjust to the brightness of the light that strikes it. If you step outside on a sunny day, you may have to shade your eyes against the intensity of the sunlight. Light intensity is the amount of light energy that strikes a certain area each second. Brightness is the human perception of light intensity. Sunlight seems bright because a large amount of light energy strikes your retina each second. Your eyes respond to bright light by decreasing the size of your pupil. This reduces the amount of light that enters your eye and strikes the retina.

Intensity depends on your distance from a light source. If you move away from a bare lightbulb, you can see how the intensity of the light rapidly decreases. Because light rays spread out from the source, less light energy strikes your retina the farther away you are from the bulb.

Correcting Vision Problems

If you have good vision, you should be able to see objects clearly when they are 25 cm or farther away from your eyes. A sharp image of an object should be formed on your retina. However, for many people, the image is blurry or formed in the wrong place, causing vision problems.

Farsightedness If you can see distant objects clearly but can't bring nearby objects into focus, then you are farsighted. In this case, the eyeball might be too short or the lens isn't curved enough to form a sharp image of nearby objects on the retina, as shown in **Figure 22**. To correct the problem, convex lenses can be used to bend incoming light rays so they converge before they enter the eye.

Figure 22 Farsightedness can be corrected by convex lenses.

336 CHAPTER 11 Sound and Light

Cultural Diversity

Arabian Lights One of the greatest early physicists was an Arabian scientist named Abu Ali al-Hasan ibn al-Haytham, better known in the West as Alhazen. Among Alhazen's contributions was the theory that vision is based on light coming from a source and being reflected from an object.

Curriculum Connection

Language Arts The manufacture of convex and concave lenses for eyeglasses and optical instruments requires high-precision measurements and the use of high-quality glass. Have students write a paper about this process. Students might mention cutting the glass, shaping the convex or concave surface, polishing, and grinding edges so that physical and optical centers match. **L2** **P** **LS** **Linguistic**

When a nearsighted person looks at distant objects, a sharp image is formed in front of the retina.

A concave lens in front of a nearsighted eye makes light rays diverge so a sharp image is formed on the retina.

Nearsightedness If you have nearsighted friends, you know that they can see only nearby objects clearly. Their eyes cannot form a sharp image on the retina of an object that is far away. Instead, the image is formed in front of the retina, as shown in **Figure 23**. To correct this problem, a nearsighted person can wear concave lenses. **Figure 23** shows how a concave lens causes incoming light rays from distant objects to diverge before they reach the eye. Then the rays can be focused by the eye to form a sharp image on the retina.

Figure 23 Nearsightedness can be corrected with concave lenses.

section 3 review

Summary

Mirrors

- A plane mirror forms upright, virtual images.
- The image formed by a concave mirror depends on the location of the object relative to the focal point.
- Convex mirrors always produce virtual, upright images that are smaller than the object.

Lenses

- The image formed by a convex lens depends on the distance of the object from the lens.
- Concave lenses always form virtual, upright images that are smaller than the object.

The Eye and Vision

- The eye contains a lens that changes shape to produce sharp images on the retina.
- Farsightedness occurs when the eye cannot form a sharp image of nearby objects. Nearsightedness occurs when the eye cannot form sharp images of distant objects.

Self Check

1. **Diagram** how light rays from an object are reflected by a convex mirror to form an image.
2. **Infer** how the size of the image changes if an object that is less than one focal length from a concave mirror moves closer to the mirror.
3. **Explain** how the focal length of a convex lens changes as the sides of the lens become less curved.
4. **Compare** the image of an object less than one focal length from a convex lens with the image of an object more than two focal lengths from the lens.
5. **Think Critically** Describe the image formed by a light source placed at the focal point of a convex lens.

Applying Math

6. **Calculate Object Distance** If you looked through a convex lens with a focal length of 15 cm and saw a real, inverted, enlarged image, what is the maximum distance between the lens and the object?

section 3 review

1. Sketches should show light rays from a single point on the object diverging after being reflected from the mirror and an upright, smaller, virtual image being formed on the other side of the mirror.
2. The image gets smaller.
3. The focal length increases as the sides of the lens become less curved.
4. The image of an object positioned less than one focal length from the lens is enlarged, upright, and virtual. The image of an object positioned more than two focal lengths from the lens is reduced, inverted, and real.
5. Light rays from the light source will be refracted by the lens so they travel parallel to the optical axis. A beam of light will be formed.
6. 30 cm (two focal lengths)

Post Reading

Reflection Tell students to imagine they are a ray of light from a distant object. Ask them to write a description of their journey through the human eye.

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Place flashlights and various plane, convex, and concave mirrors on a table. Allow students to experiment with the different mirrors and the flashlights in a darkened room. Have the students write down an observation about how each mirror affected the beams of light.

Reteach

Eyeglass Exploration Compare eyeglasses that correct nearsightedness and farsightedness. Have students examine near and far objects through each type of lens, identify whether each lens is concave or convex, and explain how each lens corrects vision problems.

L2 **ELL** **IS** **Visual-Spatial**

Assessment

Process Ask students to explain why the image you see with a magnifying glass is blurry if you hold the glass too far from the object. **The object is more than one focal length from the lens, so the image formed is real. To see the image clearly, the eye must be at the image's location.** Use **Performance Assessment in the Science Classroom**, p. 89

**Real-World
Problem**

Purpose Students will observe image formation by plane mirrors.

L1 COOP LEARN **N** Visual-Spatial

Process Skills measure, infer, recognize cause and effect, compare and contrast, form operational definitions

Time Required 45 minutes

Procedure**Teaching Strategies**

- Use rectangular mirrors at least 5 cm across. Mirror tiles from a hardware store can be cut to size, but sharp edges must be ground or taped.
- Photocopy a protractor to make worksheets for measuring angles.

**Conclude and
Apply**

1. The number of paper clip images is one less than the number of wedges.
2. The angle producing six wedges is $\frac{360}{6} = 60^\circ$. Five images will be produced.

Assessment

Performance Ask students to open the mirrors to an angle of 45° to each other. How many images of your face do you see? eight What about smaller angles? more images Larger angles? fewer images Explain. The number of images is 360° divided by the angle in degrees minus 1. Use **Performance Assessment in the Science Classroom**, p. 89

LAB

REFLECTIONS OF REFLECTIONS

How can you see the back of your head? You can use two mirrors to view a reflection of the back of your head.

Real-World Problem

How many images can you see with two mirrors?

Goal

- **Infer** how the number of images depends on the angle between two mirrors.

Materials

plane mirrors (2) protractor
masking tape paper clip

Safety Precautions

Handle glass mirrors and paper clips carefully.

Procedure

1. Lay one mirror on top of the other with the mirror surfaces inward. Tape them together so they will open and close. Use tape to label them *L* and *R* for *left* and *right*.
2. Stand the mirrors on a sheet of paper. Using the protractor, close the mirrors to an angle of 72° .

**Images and Wedges Seen
in the Mirrors**

Angle of Mirrors	Number of Paper Clip Images		Number of Wedges
	R	L	
72°	2	2	5
90°	2	1	4
120°	1	1	3

3. Bend one leg of a paper clip up 90° and place it close to the front of the *R* mirror.
4. Count the number of images of the paper clip you see in the *R* and *L* mirrors. Record these numbers in your data table.
5. The mirrors create an image of a circle divided into wedges. Record the number of wedges.
6. Hold the *R* mirror still and slowly open the *L* mirror to 90° . Record the numbers of images of the clip and wedges in the circle. Repeat, this time opening the mirrors to 120° .

Conclude and Apply

1. **Infer** the relationship between the number of wedges and paper clip images.
2. **Determine** the angle that would divide a circle into six wedges. Hypothesize how many images would be produced. Test your hypothesis.

**Communicating
Your Data**

Demonstrate for younger students the relationship between the angle of the mirrors and the number of reflections.

**Communicating
Your Data**

Have students draw circles divided into thirds (120°), quarters (90°), fifths (72°), and sixths (60°) and use the circles in their demonstrations to position the mirrors. Have them show younger students how the number of wedges seen relates to the angle between the mirrors.

Light and Color

Reading Guide

What You'll Learn

- **Explain** how you see color.
- **Describe** the difference between light color and pigment color.
- **Predict** what happens when different colors are mixed.

Why It's Important

From traffic lights to great works of art, color is an important part of your world.

Review Vocabulary

retina: inner layer of the eye containing cells that convert light images into electrical signals

New Vocabulary

- pigment

Why Objects Have Color

Why do some apples appear red, while others look green or yellow? An object's color depends on the wavelengths of light it reflects. Recall that white light is a blend of all colors of visible light. When a red apple is struck by white light, it reflects red light back to your eyes and absorbs all of the other colors. **Figure 24** shows white light striking a green leaf. Only the wavelengths corresponding to green light are reflected to your eyes.

Although some objects appear to be black, black isn't a color. Black is the absence of visible light. Objects that appear black absorb all colors of light and reflect little or no light back to your eyes. White objects appear to be white because they reflect all colors of visible light.

✓ Reading Check Why does a white object appear white?

Colored Filters Wearing tinted glasses changes the color of almost everything you see. If the lenses are yellow, the world takes on a golden glow. If they are rose colored, everything looks rosy. Something similar would occur if you placed a colored, clear plastic sheet over this white page. The paper would appear to be the same color as the plastic. The plastic sheet and the tinted lenses are filters. A filter is a transparent material that transmits one or more colors of light but absorbs all others. The color of a filter is the color of the light that it transmits.

Figure 24 This leaf absorbs all wavelengths of visible light except the wavelengths you see as green.

Tie to Prior Knowledge

Object Color Ask students to find something in the classroom that is red. Do this for orange, yellow, green, blue, and violet also. Tell students that in this section they will learn that the color of an object depends on how it absorbs or reflects light.

Activate Background Knowledge Ask students if they have ever used paints to create a picture. Explain that paints are made with pigments. Pigments are colored materials that change the color of other substances.

2 Teach

✓ Reading Check

Answer It reflects all colors of visible light.

IDENTIFYING Misconceptions

Individual Colors Students might assume that red, green, and blue are individual wavelengths of light. Explain that each of these is a range of wavelengths that has its strongest reflection at a certain wavelength.

Discussion

Black Pupils Why do the pupils of your eyes appear black? *Almost all of the light that enters your eyes through the pupils is absorbed by the retina.* **IS Logical-Mathematical**

Quick Demo Colored Filters

Materials colored filters and a multicolored object

Estimated Time five minutes

Procedure Use colored filters to demonstrate the effects shown in **Figure 25** with a colorful object in the classroom. **IS Visual-Spatial**

✓ Reading Check

Answer The object absorbs red light, so no color is reflected back to your eyes.

Discussion

Colors in the Dark Are objects still colored in a dark room? Some students may say no because color results from light reflection. Others may say yes, because the property that makes the object a certain color is still present whether or not the lights are on. **L2 IS Logical-Mathematical**

Figure 25 The color of this cooler changes when viewed through different color filters.

Looking Through Colored Filters **Figure 25** shows how the color of an object can change when you look at it through various colored filters. The cooler looks blue under white light because it reflects only the wavelengths of blue light that strike it. If you look at the cooler through a blue filter, the cooler still looks blue because the blue filter transmits the reflected blue light. However, if you look at the cooler through a red filter, the cooler seems black because the red filter blocks the blue light reflected by the cooler.

✓ Reading Check

Why does a blue object appear black when viewed through a red filter?

Seeing Color

As you approach a busy intersection, the color of the traffic light changes from green to yellow to red. On the cross street, the color changes from red to green. At a busy intersection, traffic safety depends on your ability to detect color changes rapidly. How do you see colors?

Light and the Eye In a healthy eye, light enters the eye through the cornea, is focused by the lens, and finally forms an image on the retina. The retina is made up of two types of cells that absorb light, as shown in **Figure 26**. When these cells absorb light energy, chemical reactions convert light energy into nerve impulses that are transmitted to the brain. One type of cell in the retina, called a cone, enables you to distinguish colors and detailed shapes of objects. Cones need bright light to generate nerve impulses, so they do not operate in dim light. As a result, even brightly colored objects might look gray or black in dim light.

Science

Topic: Color Blindness

Visit fl.gpscience.com for Web links to information about the causes of color blindness.

Activity Research the causes and types of color blindness. Find out how cones are related to the ability to distinguish colors.

Differentiated Instruction

Learning Disabled If students have trouble remembering which type of nerve cells of the retina interpret color and which interpret black and white, tell them to remember that the word *cone* starts with the same letter as the word *color*. To practice using this mnemonic, name some different things they might see and have them identify which type of retinal nerve cells would be used.

Cultural Diversity

Names of Colors It might seem obvious to say that the sky is blue and grass is green, but the Mayan people of Mexico have no words that clearly define these two colors. Many other cultures distinguish between colors differently as well. Even in English, differences in colors are often difficult to define. Have students bring samples of such colors to class.

Visual Learning

Figure 26 Point out the position of the retina. Behind the retina is the optic nerve, which takes information from the rods and cones and sends it to the brain. Humans have many more rod cells than cone cells. Ask students to infer the number of rods in the eyes of nocturnal animals. *They have far more rod cells than humans so they can see well at night.*

INTEGRATE Life Science Content Background

Although there are infinitely many color combinations, most people can distinguish about one million different color mixtures. While the basic function of the rods and cones is generally understood, the brain's interpretation of color signals is an active field of research. Current research into the eye-brain interface may lead to new treatments for visual impairments as well as artificial vision systems for use in many different fields, from industry to robotic space exploration.

Caption Answer

Figure 27 Students who are not red-green deficient will see the number 8.

Fun Fact

Have you ever noticed that brown is not in the rainbow? Brown is actually dark yellow.

Teacher FYI

Section of Spectrum Visible light is a tiny part of the EM spectrum. Imagine the distance between Earth and the Sun compared to the width of your thumb. Your thumb is a much larger percentage of the Earth-Sun distance than the percentage of the EM spectrum that is visible light.

Figure 26 Light enters the eye and focuses on the retina. The two types of light-detecting cells that make up the retina are called rods and cones.

Cones and Rods Your eyes have three types of cones, each of which responds to a different range of wavelengths. Red cones respond to mostly red and yellow light. Green cones respond to mostly yellow and green light. Blue cones respond to mostly blue and violet light. The second type of cell in the retina, called a rod, is sensitive to dim light and enables you to see at night. However, rod cells do not enable you to see colors.

INTEGRATE **Interpreting Color** Why does a banana look yellow? The light reflected by the banana causes the cone cells that are sensitive to red and green light to send signals to your brain. Your brain could get the same signal if a mixture of red light and green light reached your eyes. This mixture also would cause your red and green cones to respond, and you would see the color yellow. As a result, light with wavelengths corresponding to yellow light and light that is a mixture of red and green light both cause the color yellow to be seen. What happens when you look at a white shirt? You see white when all wavelengths of visible light enters your eyes. Then all three sets of cone cells send signals to the brain. The combination of these signals cause you to see the shirt as white.

Color Blindness If one or more of your sets of cone cells do not function properly, you might not be able to distinguish certain colors. This condition is called color blindness or color deficiency. About eight percent of men and one-half percent of women have some form of color blindness. The most common form of color blindness makes it difficult to distinguish between red and green. **Figure 27** shows an image that is used in a test for red-green color blindness. Because red and green are used in traffic signals, drivers and pedestrians must be able to identify them.

Figure 27 Color blindness is an inherited sex-linked condition in which certain sets of cones in the retina do not function properly. **Identify** the number that you see in the dots.

Differentiated Instruction

Challenge Have students stare at a red object for 20 seconds and then look at a white wall. They should see a faint blue/green afterimage of the object on the wall. Ask them to explain why they think this happens based on how our eyes see color. *The red cones lose sensitivity. When they look at the white wall, the part of their retinas that stared at the red object have only blue and green cones that are sensitive.* **L3**

Reading Strategy

Metacognitive Strategies Ask students: What is blue? What is yellow? How would you describe these colors? Do you find it easier to describe something that you can feel and touch, such as a desk? Do you find it difficult to comprehend text when you are reading about something that is not tangible?

Color for Photosynthesis Carotenoids, yellow and orange pigments that include xanthophyll, are always present in green plants. These pigments absorb light in the blue and green wavelengths, which helps plants, especially those growing in low-light conditions, to absorb enough light to make food.

Research Have students research to learn the primary pigment responsible for blue, lavender, and purple flowers. **anthocyanins**

Activity

Filter Combinations Provide groups of students with red, green, and blue color filters (or colored transparency film) and an overhead projector. Have them use different combinations of filters to produce the colors yellow, magenta, and cyan. Ask them to write down the combination of filters they used to produce each color. **Red and green produce yellow. Red and blue produce magenta. Green and blue produce cyan.**

L2 ELL LS Visual-Spatial P

Reading Check

Answer red, green, and blue

Virtual Labs

Colors How are colors created?

Color for Photosynthesis

Plant pigments determine the wavelengths of light for photosynthesis. Leaves usually look green because of the pigment chlorophyll. Chlorophyll absorbs most wavelengths of visible light except green, which it reflects. However, not all plants are green. Research different plant pigments to find out how they allow plant species to survive in diverse habitats.

Mixing Colors

If you have ever browsed through a paint store, you have probably seen displays where customers can select paint samples of almost every imaginable color. The colors are a result of mixtures of pigments. For example, you might have mixed blue and yellow paint to produce green paint. A **pigment** is a colored material that is used to change the color of other substances. The color of a pigment results from the different wavelengths of light that the pigment reflects.

Mixing Colored Lights From the glowing orange of a sunset to the deep blue of a mountain lake, all the colors you see can be made by mixing three colors of light. These three colors—red, green, and blue—are the primary colors of light. They correspond to the three different types of cones in the retina of your eye. When mixed together in equal amounts, they produce white light, as **Figure 28** shows. Mixing the primary colors in different proportions can produce the colors you see.

✓ **Reading Check** What are the primary colors of light?

Paint Pigments If you were to mix equal amounts of red, green, and blue paint, would you get white paint? If mixing colors of paint were like mixing colors of light, you would, but mixing paint is different. Paints are made with pigments. Pigments produce color as a result of the wavelengths of light they reflect. Paint pigments usually are made of chemical compounds such as titanium oxide, a bright white pigment, and lead chromate, which is used for painting yellow lines on highways.

Figure 28 White light is produced when the three primary colors of light are mixed in equal amounts.

342 CHAPTER 11 Sound and Light

Active Reading

Cause-and-Effect Chart This strategy is used to focus on cause-effect relationships. Have students write *Mixing Colors*. On the left, instruct them to write combinations of the primary colors of light, followed by combinations of the primary pigments. On the right side, have students record the color that will result from each combination.

Mixing Pigments You can make any pigment color by mixing different amounts of the three primary pigments—magenta (bluish red), cyan (greenish blue), and yellow. In fact, color printers use these pigments, as well as black ink, to make full-color prints like the pages in this book. A primary pigment's color depends on the wavelengths of the light that it reflects. Actually, pigments both absorb and reflect a range of colors in sending a single color message to your eye. For example, in white light, yellow pigment appears yellow because it reflects red and green light but absorbs the other wavelengths of visible light. The color of a mixture of two primary pigments is determined by the primary colors of light that both pigments reflect.

Look at **Figure 29**. The area in the center where the colors all overlap appears to be black because the three blended primary pigments absorb all the primary colors of light. Recall that the primary colors of light combine to produce white light. They are called additive colors. However, when the primary pigment colors are combined, they absorb all wavelengths of visible light and produce black. Because black results from the absence of reflected light, the primary pigments are called subtractive colors.

Figure 29 The three primary pigment colors appear to be black when they are mixed.
Describe how the primary pigment colors are similar to the primary colors of light.

Caption Answer
Figure 29 Primary pigment and light colors can each be mixed in different amounts to form all colors.

Post Reading

Lab Notes Give small groups of students red, blue, and yellow fingerpaints. Students should wear lab aprons as they experiment with mixing the colors. Have them take lab notes as they work, describing the color combinations they produce.

3 Assess

DAILY INTERVENTION

Check for Understanding
Kinesthetic Create some color samples with combinations of magenta, cyan, and yellow paints. Provide students with sets of magenta, cyan, and yellow paint. Have students match the color samples with the paint you have provided.

Reteach
Pigments Have students work in groups to combine small amounts of various primary pigment paints to make other colors. For each color, have them describe which colors are reflected and which are absorbed. Be sure they mix all three primary pigments to produce black. Point out that black pigment absorbs almost all light and reflects almost none.
L2 ELL COOP LEARN IS
Kinesthetic

section 4 review

Summary

Why Objects Have Color

- The color of an object is determined by the wavelengths of light it reflects.
- The color of a filter is the color of the light the filter transmits.

Seeing Color

- Rod and cone cells are light-sensitive cells found in the retina of the human eye.
- Rod cells are sensitive to dim light. Cone cells enable colors to be seen.
- There are three types of cone cells. One type responds to red light, another to green light, and another to blue light.

Mixing Colors

- Red, green, and blue are the primary light colors. Any color of light can be created by mixing these primary light colors.
- Any pigment color can be formed by mixing the primary pigment colors—magenta, cyan, and yellow.

Self Check

1. **Identify** what colors are reflected and what colors are absorbed if a white light shines on a red shirt.
2. **Discuss** how the primary colors of light differ from the primary pigment colors.
3. **Explain** why a red apple would appear black if you looked at it through a blue filter.
4. **Determine** why a white fence appears to be white instead of multicolored if all colors are present in white light.
5. **Think Critically** Light reflected from an object passes through a green filter, then a red filter, and finally a blue filter. What color will the object seem to be?

Applying Math

6. **Use Percentages** In the human eye there are about 120,000,000 rods. If 90,000,000 rods trigger at once, what percentage of the total number of rods triggered?
7. **Convert Units** The wavelengths of light are measured in nanometers (nm) which equals 0.000001 mm. Find the wavelength in mm of a light wave that has a wavelength of 690 nm.

section 4 review

1. Red is reflected and all others are absorbed.
2. The primary colors of light are red, green, and blue. The primary pigment colors are magenta, cyan, and yellow. The primary colors of light transmit the color you see, whereas the primary pigment colors reflect
3. Red light from the apple would be absorbed by the filter.
4. The fence reflects all colors of visible light. Because all the cones in your eyes are stimulated, you see white.
5. It will appear black.
6. 75%

7. 0.00069 mm
MA.A.3.4.1, MA.B.2.4.2

Assessment

Oral Assess students' understanding of colors by asking them to explain why black and white are not true colors. Black is a lack of color that occurs when all light is absorbed. White occurs when all colors are reflected. Use **PASC**, p. 89.

Real-World Problem

Purpose Students will test various sound barriers for effectiveness. **L2** **AS** **Auditory-Musical**

Process Skills form a hypothesis, predict, test a hypothesis, identify and manipulate variables, collect data, interpret data

Time Required 2 weeks outside of class time

Materials Many of these barriers are not normally located around a school. Students may need to be provided with a sound meter and a meterstick or metric tape measure to perform this lab outside of class.

Safety Precautions Students should have some adult supervision when collecting their data.

Form a Hypothesis

Possible Hypothesis Students may hypothesize that thick concrete walls or thick stone walls are the best sound barriers and hanging laundry is the least effective.

Test Your Hypothesis

Possible Procedures Students should choose a sound that will remain constant for each sound barrier tested, such as a recording of a sound at a constant volume. At the location of the sound barrier, students should record the level of the sound using the sound meter at the same distance from the source to the meter both behind the sound barrier and bypassing the sound barrier. These conditions will provide a test with only one variable.

Blocking Noise Pollution

Real-World Problem

What loud noises do you enjoy, and which ones do you find annoying? Most people enjoy a music concert performed by their favorite artist, booming displays of fireworks on the Fourth of July, and the roar of a crowd when their team scores a goal or makes a touchdown. Although these are loud noises, most people enjoy them for short periods of time. Most people find certain other loud noises, such as traffic, sirens, and loud talking, annoying. Constant, annoying noises are called noise pollution. What can be done to reduce noise pollution? What types of barriers best block out loud noises? What types of barriers will best block out noise pollution?

Form a Hypothesis

Based on your experiences with loud noises, form a hypothesis that predicts the effectiveness of different types of barriers at blocking out noise pollution.

Test Your Hypothesis

Make a Plan

1. **Decide** what type of barriers or materials you will test.
2. **Describe** exactly how you will use these materials.

Goals

■ **Design** an experiment that tests the effectiveness of various types of barriers and materials for blocking out noise pollution.

■ **Test** different types of materials and barriers to determine the best noise blocks.

Possible Materials

radio, CD player, horn, drum, or other loud noise source
shrubs, trees, concrete walls, brick walls, stone walls, wooden fences, parked cars, or hanging laundry
sound meter
meterstick or metric tape measure

Alternative Inquiry Lab

Real-World Connection To extend this lab, have students research various sound barriers and sound control strategies in their own municipality and in other municipalities nationally and worldwide. Which areas of the world have the most noise pollution? What causes the noise pollution? What effects does noise pollution

have on human and animal health? Other topics of research include the use of destructive wave strategies through headphones to reduce noise for helicopter pilots and for factory workers. Encourage students to test noise-reduction materials and methods that can be used.

Using Scientific Methods

3. **Identify** the controls and variables you will use in your experiment.
4. **List** the steps you will use and describe each step precisely.
5. **Prepare** a data table in your Science Journal to record your measurements.
6. **Organize** the steps of your experiment in logical order.

Follow Your Plan

1. Ask your teacher to approve your plan and data table before you start.
2. **Conduct** your experiment as planned.
3. **Test** each barrier two or three times.
4. **Record** the results from each test in your data table in your Science Journal.

Analyze Your Data

1. **Identify** the barriers that most effectively reduced noise pollution.
2. **Identify** the barriers that least effectively reduced noise pollution.
3. **Compare** the effective barriers and identify common characteristics that might explain why they reduced noise pollution.
4. **Compare** the natural barriers you tested with the artificial barriers. Which type of barrier best reduced noise pollution?
5. **Compare** the different types of materials the barriers were made of. Which type of material best reduced noise pollution?

Conclude and Apply

1. **Evaluate** whether your results support your hypothesis.
2. **Predict** how your results would differ if you used a louder source of noise such as a siren.
3. **Infer** from your results how people living near a busy street could reduce noise pollution.
4. **Identify** major sources of noise pollution in or near your home. How could they be reduced?
5. **Research** how noise pollution can be unhealthy.

Communicating Your Data

Draw a poster illustrating how builders and landscapers could use certain materials to better insulate a home or office from excess noise pollution.

LAB 345

Assessment

Process Have students describe their procedures and their results for this activity in lab reports. Suggest that they include diagrams or photographs of their setups. Use **Performance Assessment in the Science Classroom**, p.119 **L2**

Communicating Your Data

A gardening book from your local library will be helpful in choosing plants to use in the landscape design.

Teaching Strategy Remind students that it is important for the sound barriers to be tested using the same distance from the sound source to the sound meter in each test.

Expected Outcome Most results will show that thick concrete walls or thick stone walls are the best sound barriers.

Analyze Your Data

Answers to Questions

1. Answers will vary but may include concrete and stone walls.
2. Answers will vary but may be similar to hanging laundry.
3. The effective barriers are thick and dense structures.
4. Answers will vary.
5. Answers will vary.

Error Analysis Have students compare their results and their hypotheses and explain why differences occurred.

Conclude and Apply

1. Answers will vary.
2. The ranking of sound barriers would be the same.
3. People could build some type of sound barrier between the house and the street.
4. Answers will vary.
5. Reported findings should include eardrum damage.

Understanding Literature

Japanese Haiku Because haiku uses few words, the reader must use his or her imagination to complete the picture or message.

Respond to the Reading

1. Possible answer: It helps the reader picture the season.
2. Possible answer: Lingering indicates that the Sun remains longer in the sky each day during spring.
3. **Linking Science and Writing** Suggest that students pay attention to the mood they want to convey with their poems, and use color and properties of light appropriately.

Color

The perception of color can affect the human body. For example, the color red can cause physiological changes in the body. Some studies have shown that seeing red can be correlated with increasing blood pressure, more rapid breathing, increased taste bud sensitivity, and heightened sense of smell. Seeing the color blue has been linked to the opposite effects: slowing of the pulse, lowering of the body temperature, and reduction of the appetite.

Yellow is usually the first color a person notices when he or she looks at something. Studies have suggested that yellow prepares a person for flight or fight, that children are more apt to cry in a yellow room, and that allergies flare up more frequently in yellow surroundings. Green, on the other hand, has been found to help decrease allergic reactions in some people.

spring sunlight
Issa

Understanding Literature

Japanese Haiku A haiku is a verse that consists of three lines and 17 syllables in the Japanese language. The first and third lines have five syllables each, and the middle line has seven syllables. Why is imagination important in reading haiku?

Respond to the Reading

1. How do the illustrations help the reader better understand the poems?
2. What do you think is meant by the word *lingering* in the Haiku about spring sunlight?
3. **Linking Science and Writing** Write one haiku about summer and another about fall. In one poem, use color to help you describe the season. In the other, use light or some property of light to help describe the season.

Research has determined that there is a connection between color and mood. Warm colors have longer wavelengths and can be more stimulating. Cool colors, which have shorter wavelengths, tend to have a calming or soothing effect on people. Light and color have long been used as literary symbols. Does the use of color change what you imagine when you read the haiku?

Resources for Teachers and Students

The Essential Haiku, ed. and trans. Robert Hass, The Ecco Press, 1994

The Power of Color, Dr. Morton Walker, Avery Publishing Group, 1991

Reviewing Main Ideas

Section 1 Sound

1. Sound waves are compressional waves that travel only in matter.
2. The speed of sound in a material depends on the type of material as well as its temperature.
3. Loudness depends on a sound wave's intensity. Pitch depends on a sound wave's frequency.
4. Sound waves are used in echolocation, sonar, and medical imaging.

Section 3 Mirrors, Lenses, and the Eye

1. Plane mirrors form upright, virtual images.
2. Images formed by concave mirrors and convex lenses depend on the location of the object relative to the focal point.
3. Convex mirrors and concave lenses form virtual, upright images that are smaller than the object.
4. The lens in the human eye changes shape to produce a sharp image on the retina.

Section 2 Reflection and Refraction of Light

1. Light can be absorbed, reflected, or transmitted by a material.
2. When light waves are reflected, they obey the law of reflection—the angle of incidence equals the angle of reflection.

3. A light wave is refracted, or bent, when it changes speed as it travels at an angle from one material to another.

Section 4 Light and Color

1. You see color when light is reflected off objects and into your eyes.
2. Cone cells in the retina are light-sensitive cells that enable you to distinguish colors.
3. Red, blue, and green are the three primary colors of light and can be mixed to form all other colors.
4. The primary pigment colors are magenta, cyan, and yellow.

FOLDABLES Use the Foldable you made at the beginning of the chapter to help you review sound and light.

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

 translucent p. 327
 transparent p. 327

Complete each statement with the correct vocabulary word or phrase.

1. A change in frequency due to a moving sound source is due to the _____.
2. A flat, smooth surface that reflects light and forms an image is a(n) _____.
3. An object is _____ if you can see through it clearly.
4. The _____ of a material indicates how much the speed of light in the material changes as light passes through.
5. You can change the color of white paint by adding a(n) _____ to it.
6. A(n) _____ is a reflecting surface that curves outward like the back of a spoon.
7. The human perception of the intensity of a sound wave is _____.

Checking Concepts

Choose the word or phrase that best answers each question.

8. Which of the following best describes image formation by a plane mirror?
 - A) A real image is formed in front of the mirror.
 - B) A real image is formed behind the mirror.
 - C) A virtual image is formed in front of the mirror.
 - D) A virtual image is formed behind the mirror.

9. For a sound with low pitch, what else is also always low?

A) amplitude C) wavelength
 B) frequency D) wave velocity

10. Which of the following occurs when a sound source moves away from you?

A) The sound's velocity decreases.
 B) The sound's loudness increases.
 C) The sound's frequency decreases.
 D) The sound's frequency increases.

Use the table below to answer question 11.

Speed of Sound in Air

Temperature (°C)	Sound Speed (m/s)
0	331.4
10	337.4
20	343.4

11. Based on the data in the table above, which of the following would be the speed of sound in air at 30°C?
 - A) 340.4 m/s C) 349.4 m/s
 - B) 346.4 m/s D) 353.4 m/s
12. What happens to a light ray traveling parallel to the optical axis of a convex lens that passes through the lens?
 - A) It travels parallel to the optical axis.
 - B) It passes through the focal point.
 - C) It is bent away from the optical axis.
 - D) It forms a virtual image.
13. Light waves of which color are bent most when passing through a prism?
 - A) blue C) violet
 - B) red D) yellow
14. Which way does a concave lens bend light?
 - A) toward its optical axis
 - B) toward its center
 - C) toward its edges
 - D) toward its focal point

Interpreting Graphics

Use the illustration below to answer question 15.

15. **Describe** how the position of the candle changed if the image of the candle moved away from the focal point.

Thinking Critically

16. **Apply** Acoustic scientists sometimes do research in rooms that absorb all sound waves. How could such a room be used to study how bats find their food?
17. **Compare** White light passes through a translucent pane of glass and shines on a shirt. Both the translucent glass and the shirt appear green. Compare the colors of light that are absorbed and transmitted by the glass and the shirt.
18. **Infer** Most mammals, including dogs and cats, can't see colors. Infer how the retina of a cat's eye might be different from the retina of a human eye.
19. **Determine** whether a convex lens could form an image that is enlarged, real, and upright.
20. **Infer** A car comes to a railroad crossing. The driver hears a train's whistle and its pitch becomes lower. What can be assumed about how the train is moving?
21. **Compare and contrast** the reflection of light from a white wall with a rough surface with the reflection of light from a mirror.

22. **Infer** why a convex mirror and a concave lens can never produce a real image.
23. **Predict** what color a white shirt would appear to be if the light reflected from the shirt passed through a red filter and then through a green filter.
24. **Explain** why windows might begin to rattle when an airplane flies overhead.
25. **Communicate** Some people enjoy using snowmobiles. Others object to the noise that they make. Write a proposal for a policy that seems fair to both groups for the use of snowmobiles in a state park.

Applying Math

Use the wave speed equation, $v = f\lambda$, to answer questions 26 and 27.

26. **Calculate Frequency** A sonar pulse has a wavelength of 3.0 cm and a speed in water of 1,500 m/s. Find its frequency.
27. **Calculate Wavelength** What is the wavelength of a sound wave with a frequency of 440 Hz if the speed of sound in air is 340 m/s?
28. **Calculate Angle of Incidence** A light ray is reflected from a mirror. If the angle between the incident ray and the reflected ray is 136° , what is the angle of incidence.
29. **Determine Object Distance** You hold an object in front of a concave mirror with a focal length of 30 cm. If you do not see a reflected image, how far from the mirror is the object?
30. **Calculate Speed** The speed of light in a vacuum is 300,000 km/s. If the index of refraction of water is 1.33, what is the speed of light in water?

Thinking Critically

18. Possible answer: A cat's retina does not have the cone nerve cells that a human's retina does.
19. No; a convex lens forms an enlarged, upright image that is virtual when the object is less than one focal length from the lens and an enlarged, real image that is inverted when the object is between one and two focal lengths from the lens. An object more than two focal lengths from the lens forms a real, upright, smaller image.
20. The train is moving away from the crossing.
21. Both reflect all the colors of light that hit them. Reflection from a rough white wall is diffuse, whereas reflection from a mirror is regular.
22. Both a convex mirror and a concave lens cause light rays that strike them always to diverge.
23. The red filter transmits only the red light reflected from the shirt. This light would be absorbed completely by the green filter, and no light would be transmitted. The shirt would appear black.
24. The airplane produces sound waves that vibrate the glass.
25. Proposals might suggest limiting the use of snowmobiles to certain times of the day or to certain areas that are more isolated.

Applying Math

Math Standards

National: 1, 4, 9

Florida: MA.B.1.4.2, MA.B.2.4.1

26. 50,000 Hz (50 kHz)
27. 0.77 m
28. 68°
29. 30 cm
30. 225,000 km/s

SC.F.1.4.2

7. Which of the following parts of the eye enable you to see colors in bright light?

- A. cone cells
- B. cornea
- C. lens
- D. rod cells

Gridded Response

Use the graph below to answer questions 8 and 9.

- 8. Determine how far, in centimeters, the image is from the lens when the object is 15 centimeters from the lens.
- 9. How far, in centimeters, is the object from the lens when the image distance and object distance are equal?

Test-Taking Tip

Note Units Read carefully and make note of the units used in any measurement.

Short Response

- 10. A shirt has stripes that are black and white in white light. If green light shines on this shirt, what colors will the black and white stripes be?
- 11. If you are on a moving train, what happens to the pitch of a crossing bell as you approach the crossing and then move away from the crossing?

Extended Response

Use the figure below to answer question 12.

SC.F.1.4.2

- 12. Describe the vision problem shown by the figure and explain how this vision problem can be corrected.

SC.F.1.4.2

- 13. Explain why the human eye can see colors better in bright light than in dim light.

Gridded Response

- 8. 7.5 cm
- 9. 10 cm

Short Response

- 10. The black stripes will still appear black, and the white stripes will appear green.
- 11. The pitch is higher as you approach the signal and lower as you move away.

Extended Response

- 12. This problem is farsightedness, which is the inability to focus on nearby objects. A convex lens in front of the eye converges light rays so the lens in the eye is able to focus on nearby objects.
- 13. In bright light, cone cells in the retina are stimulated by visible light and produce the sensation of color. In dim light, these cells are not stimulated.

Rubrics

For more help evaluating Short- and Extended-Response questions, see the rubric on p. 9T.

Section/Objectives	Standards		Lab/Features
Chapter Opener	National	State/Local	Launch Lab: Global Jigsaw Puzzle, p. 353 Foldables , p. 353
	See pp. 16T–17T for a Key to Standards.		
Section 1 Evolution of Earth's Crust  1 session  .5 block 1. Explain supporting evidence for the continental drift hypothesis. 2. Discuss the failings of the continental drift hypothesis.	National Content Standards: UCP.1-3, UCP.5, A.1, A.2, D.1	Florida Benchmarks: SC.A.1.4.1, SC.A.1.4.2, SC.D.1.4.4, SC.H.1.4.1-3, SC.H.1.4.6, SC.H.2.4.1	Applying Math: Spreading Distances, p. 357 Integrate Physics , p. 358 Science Online , p. 359
Section 2 Earthquakes  2 sessions  1 block 3. Describe the causes and characteristics of earthquakes. 4. Explain how seismic waves affect Earth's surface. 5. Describe how seismic waves are used to infer Earth's internal structure. Section Focus

Section Focus Transparency Chapter 12

A Man with a Vision

Alfred Wegener once wrote, "Scientists still do not understand sufficiently that all earth sciences must contribute evidence toward unveiling the state of our planet in earlier times... It is only by combing the information... that we can hope... to find the picture that sets out all the known facts in the best arrangement and that therefore has the highest degree of probability. Further, we have to be prepared always for the possibility that each new discovery, no matter what science furnishes it, may modify the conclusions we draw."

1. Why was Wegener's belief that all branches of science must work together considered radical during his lifetime?
2. Have commonly accepted ideas about scientific research changed since then?
3. Do you agree with Wegener's statement? Why or why not?

L2

Section Focus Transparency Chapter 12

Earthquake Hazards

During earthquakes, buildings and bridges can collapse, roads can be twisted and underground utilities such as electric, water, and natural gas lines can be broken. Even after the earthquake is over, damaged structures still pose a risk of falling and exposed electrical and gas sources can still be dangerous.

1. How do you think earthquakes affect physical structures?
2. Where are earthquakes most likely to occur?
3. Where, do you think, would be the safest place to be during an earthquake?

L2

Section Focus Transparency Chapter 12

A Hollow Earth?

The French author Jules Verne wrote one of the greatest science fiction books of all time called *A Journey to the Center of the Earth*. In the book, the professor does indeed find the entrance to the hollow Earth. The professor and his companions walk on the underside of Earth's crust and gaze at the inner Earth's sun. They sail the inner sea, traverse immense dense forests, and even encounter beings much like ourselves.

1. Do you believe Earth could be hollow?
2. How could living beings survive inside a hollow Earth?
3. Does modern science disprove the possibility that Earth is hollow? How?

L2

Section Focus Transparency Chapter 12

Under the Volcano

In 79 A.D., Mount Vesuvius erupted near the Roman city of Pompeii. Dust, ash, cinders, and rocks flew high into the air. During the first eight hours of the eruption they fell on Pompeii to depths of eight to ten feet. In the wreckage of the eruption, a superheated cloud of steam and mud flowed from the side of Vesuvius and covered the town of Herculaneum.

1. Based on the description, what kind of volcano was Mount Vesuvius?
2. What could the people of Pompeii and Herculaneum have done to save themselves?
3. What might modern scientific knowledge have done to help minimize the damage?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.
- ELL** ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Assessment

Assessment Transparency Chapter 12

Earth's Internal Processes

Earthquakes, volcanoes, and most tectonic activities occur at the point where two plates meet or move against each other. At convergent boundaries, plates move towards each other and collide. At divergent boundaries, plates move away from each other and the space is filled by molten rock rising and cooling to add new material and area to the plates. But with transform-fault boundaries, plates move horizontally past each other. Where these transform-fault lines are located, the regions are geologically very active. The most volcanically and seismically active region on Earth is known as the "Ring of Fire." Three-fourths of Earth's active and dormant volcanoes lie along this arc, at the margins of the large Pacific Plate.

1. What happens at convergent boundaries such as the Nazco Plate and the South American Plate? What surface features exist along these boundaries?
2. Identify a large divergent boundary. What does this mean for the continents resting on these two plates?
3. Why are volcanoes located most often along transform fault boundaries?
4. What is the correlation between volcanoes and earthquake events? Can one occur without the other?

L2

Teaching

Teaching Transparency Chapter 12

Earthquake Intensity Scale

Richter Scale Earthquake Severity

The Richter scale was developed by a scientist named Charles Richter in 1934. His scale measures the amplitude of seismic waves measured at a number of sites for any given earthquake to determine its assigned magnitude. The Richter scale ranges from 1 to 10 on a logarithmic scale with 10 being the most severe earthquake.

Modified Mercalli Intensity Scale

The Mercalli scale was invented by Giuseppe Mercalli in 1902 and updated in 1931 by seismologists Harry Wood and Frank Neumann to become the Modified Mercalli scale. This scale uses observations and personal accounts by survivors to assign a Roman numeral value of I to XII to an earthquake event with XII being the most severe. Lower numbers generally reflect how an earthquake felt to people while higher numbers are based on observed structural damage.

Hands-on Activities

Student Text Lab Worksheet

LAB A Case for Pacific Plate Motion

Lab Preview
Directions: Answer these questions before class.

1. What are the three main types of plate boundaries?
2. What are the three main types of plate boundaries?

Real World Problem
The Pacific Plate is moving northward at a rate of about 10 cm per year. How fast is this in miles per year?

Procedure
1. Read the article about the Pacific Plate.

Exit Ticket
Write a short paragraph about the Pacific Plate.

L2

Laboratory Activities

LAB Laboratory Activity

Tasty Quake

Strategy
Visual discrimination

Materials
popsicles
straws

Procedure
1. Cut a popsicle in half.

Observation
Observe what happens to your structure building.

Science Content Background

Evolution of Earth's Crust

Continental Drift

The theory of plate tectonics has its roots in Alfred Wegener's hypothesis of continental drift. Key ideas are:

- that the theory is “new”, barely a century old.
- Wegener was unable to explain a mechanism for his hypothesis. The hypothesis was not accepted.
- World events helped to develop the technology needed to support the theory.

Seafloor Spreading Hypothesis

Dr. Harry Hess revived the notion of moving plates. He added several important revisions:

- Earth's crust is divided into interconnected plates.
- Plates may consist of continental crust, oceanic crust, or both.
- Oceanic crust is forming along the mid-ocean ridge system, which is coincident with divergent zones.

• Growth of Earth's crust is counteracted by destruction of crust at other locations. The seafloor spreading hypothesis supports plate tectonic theory.

- Convection beneath the crust is hypothesized to be the driving mechanism.
- Convection drives both divergent and convergent zones; it creates tensional stress beneath continental crust, which results in formation of rift valleys.
- It facilitates the collision and destruction of crust at plate boundaries.
- Collision zones are locations of many earthquakes and formation of volcanic mountain chains either at sea (island arcs) or along continental margins (volcanic arcs).
- The mid-ocean ridge seafloor spreading zone experiences shallow volcanic activity.

Earthquakes

Predicting Earthquakes

Earthquakes are a subsurface phenomena that originate at a point of weakness in the rock structure. Faults are breaks or cracks in rock along which movement has occurred. Energy radiates spherically outward in all directions from the focus. Energy travels in three different seismic wave patterns: primary, secondary, and surface. The different patterns are critical to the behavior of surface materials and their destructive effects. These waves can break the integral structure of buildings, allowing them to collapse under their own weight. Attempts to precisely predict earthquakes have been unsuccessful to date. Efforts center around: (1) measuring stresses and strain across known faults, (2) monitoring suspected precursor factors, such as changes in water table levels or release of gases into the fault zone, or (3) monitoring surface deformation using laser surveying technology.

section 3

Earth's Interior

Density Differentiation

Earth's layered structure was created through density differentiation. During its formational stages, Earth was bombarded by meteors and asteroids (planetesimals). Impact of planetesimals caused melting of primordial Earth. The molten matter then separated or differentiated according to density and either sank toward the planetary center or solidified on the surface. Millions of years of this process have allowed the densest matter to accumulate in the core and grade toward a less dense crust.

The physical state of these layers is dependent on the interaction of temperature and pressure. The outer core is a liquid. This is believed to be because the pressure of the overlying matter is insufficient to overcome the effect of temperature created by heat release from radioactive material in the core.

section 4

Volcanoes

Differences in Magma

Volcanic eruptions are controlled by temperature, gas content, and composition of the magma. The interplay of these variables produces a variety of eruption styles and resulting landforms. As a rule, temperature is most important and is directly linked to composition. High temperature magmas tend to be low in silica (basaltic) and have a low viscosity. This facilitates rapid flow and low profile landforms. In contrast, low temperature magmas are high in silica (granitic) and are resistant to flow. This creates high profile landforms. Magmas can change composition and viscosity as they move up to the surface or as they flow across the surface.

Bowen's reaction series is critical to an understanding of the order of crystallization of various magma compositions.

Italian Fireworks

Sicily's Mt. Etna is the largest volcano in Europe. Molten rock from deep in Earth rose through a weak spot in the crust and erupted many times onto Earth's surface. Some of the exposed lava at the base of Mount Etna is nearly 300,000 years old.

Science Journal Research the most recent eruption and write a report about how it affected the surrounding environment.

352

Theme Connection

Stability and Change An expanding sphere will grow in diameter and its surface material will thin, much like an inflating balloon. An expanding Earth should do the same; however, it does not. This is because even though in some places Earth appears to be expanding (divergent boundaries), in others it appears to be contracting (convergent boundaries).

About the Photo

Get Ready Mt. Etna is located on the island of Sicily and is one of Earth's most active volcanoes. The photo shows a pyroclastic mixture of gas and lava erupting from the cone. Scientists predict that this is the beginning of more frequent eruptions due to increased earthquake activity associated with a recent, large intrusion of magma.

Start-Up Activities

Global Jigsaw Puzzle

Alfred Wegener, a German scientist, noticed that the shapes of continental coastlines appeared as though they could match up. He suggested that the continents once were together as one giant landmass. Use a map of the world to test this idea. Can you see what he saw? 

1. Cut out continents from a copy of a world map provided by your teacher.
2. Try to arrange continents so that they fit together.
3. Infer why the fit might not be perfect.
4. **Think Critically** What changes in procedure might demonstrate a better fit for the continents?

Preview this chapter's content and activities at www.ck12.org

FOLDABLES™ Study Organizer

Systems Make the following Foldable to help you organize information about types of plate boundaries.

- STEP 1** Fold one piece of paper lengthwise into thirds.

- STEP 2** Fold the paper widthwise into fourths.

- STEP 3** Unfold, lay the paper lengthwise, and draw lines along the folds. Label your table as shown.

Plate Boundary Type	Description	Illustration
Divergent		
Convergent		
Transform		

Making a Table As you read the chapter, complete the table describing and illustrating divergent, convergent, and transform plate boundaries.

Purpose Use this Launch Lab to introduce students to Wegener's concept of continental drift. [L2]

LS Kinesthetic

Preparation Make copies of a world map. Be careful to use a modern conic or Robinson projection. Use a different map projection to stimulate class critical thinking.

Materials copies of a world map, scissors

Teaching Strategy Be open ended. Allow students to be creative.

Troubleshooting Discuss what a continent is and how to locate its edges.

Think Critically

Answers may vary, but the map projection used will be most important. Using something other than continental edges for positioning land masses should be discussed.

Assessment

Oral Have students speculate why this idea was not thought of sooner. Technology of map making and knowledge of longitude was lacking.

FOLDABLES™ Study Organizer

Section Focus Transparency A Man with a Vision Chapter 12

Alfred Wegener once wrote, "Scientists still do not... understand sufficiently that all earth sciences must contribute evidence toward unveiling the state of our planet in earlier times... It is only by combing the information... that we can hope... to find the picture that sets out all the known facts in the best arrangement and that therefore has the highest degree of probability. Further, we have to be prepared always for the possibility that each new discovery, no matter what science furnishes it, may modify the conclusions we draw."

1. Why was Wegener's belief that all branches of science must work together considered radical during his lifetime?
2. Have commonly accepted ideas about scientific research changed since then?
3. Do you agree with Wegener's statement? Why or why not?

L2

★ FCAT Vocabulary

What You'll Learn

- **Explain** supporting evidence for the continental drift hypothesis.
- **Discuss** the failings of the continental drift hypothesis.

Why It's Important

Wegener's continental drift hypothesis led to a unifying theory of Earth sciences known as plate tectonics.

Review Vocabulary

hypothesis: statement proposed to explain an observation or answer a question

New Vocabulary

- ★ **mid-ocean ridge**
- ★ **rift valley**
- **divergent boundary**
- ★ **convergent boundary**
- **subduction**
- **transform boundary**

Continental Drift

Figure 1 This illustration is an artist's conception of what Pangaea may have looked like 200 million years ago.

In the early twentieth century, there was no single theory of how Earth processes interrelated. Much geologic study was done locally because transportation and communication were expensive. Based upon their observations, geologists developed theories that emphasized vertical changes, for example, an erosion process that leveled high places, and a mountain-building process that lifted them up again.

Then in 1915, Alfred Wegener (VEG nur) proposed a hypothesis that suggested that Earth's continents once were part of a large super-continent, shown in **Figure 1**, called Pangaea (pan GEE uh). Then, about 200 million years ago, the super-continent broke into pieces that drifted over the surface of Earth like rafts on water. This revolutionary idea of horizontal movement met with great resistance among his peers. He was unable to find the force capable of moving continents. It wasn't until after his death in 1930, that scientific advances finally justified his hypothesis.

IDENTIFYING

Misconceptions

Continental Boundaries Wegener's misconception was that the continents alone were drifting through the ocean basins. Students can easily have the same view. Stress that plate edges often are not the same as continental edges and that the whole plate is moving.

Make a Model

Continents Have students use construction paper or cardboard to trace the shapes of the continents and carefully cut them out. Add geographical features. Students may match up the edges of the continents to illustrate Wegener's hypothesis. **L1 ELL**

Visual-Spatial

Activity

Continental Reconstruction Replicate Wegener's argument about torn newspaper. Randomly tear an entire section of newspaper into strips. Jumble all the page strips. Give different groups different strips and clear tape. Have the groups reconstruct what they can and then collaborate with other groups to reassemble the whole section.

Caption Answer

Figure 3 Mobile animals could overcome gaps between continents.

Matching Coastlines The most apparent match of continents is the eastern coastline of South America with the western coastline of Africa. If you use your imagination, you can see that the coastline of northwestern Africa fits nicely with that of the eastern United States. When South America and Africa are joined together, their southern tips fit very well into the Weddell Sea of Antarctica.

Wegener had to show that the continents were actually joined. He used the analogy of a torn newspaper being repaired. Not only did you have to match the shapes, but also join the lines of print. And the print had to match in terms of its content as well. What kind of content could this refer to in coastal regions of the continents? Wegener argued that you could match rock types, fossils, erosion features, and mountain ranges. If you found similar formations and structures on each continent then the continents could have been joined together in that place.

Wegener's opponents pointed out that the coastlines are constantly wearing away due to wave action. How could someone compare the present coastlines? Years later, during the revival of the hypothesis, oceanographers were able to show, using sonar, that the edges of the continental shelves matched very well, as shown in **Figure 2**.

Matching Fossils Wegener could not use the remains of just any ancient living thing to support the existence of Pangaea. For instance, animals that could fly or swim could appear in the fossil record in widely separated places due to their mobility, not because the places were necessarily joined. Large land animals provided better evidence because they could not have crossed oceans. Animals such as *Lystrosaurus* or *Cynognathus*, large animals that preceded the dinosaurs, supported a contiguous landmass. *Glossopteris*, a large fern with large, heavy spores also supported the idea of Pangaea. You can see in **Figure 3** that these living things were widely distributed.

Figure 2 Weathering of the continental edges does not affect the continental shelves (light blue).

Figure 3 Wegener chose fossils of animals that could not swim or fly to prove Pangaea's existence.

Explain Why would being able to fly or swim eliminate a fossil organism from Wegener's proof?

Discussion

Animal Evidence Challenge the students to list animals that would not have been useful to Wegener in his proof of continental drift, and why. **Students should list saltwater swimmers and fliers because they can move from continent to continent freely.** **L3**

IDENTIFYING Misconceptions

Subduction Inform students that most rocks sink. This is how one plate can subduct beneath another. It is heavier and denser than the material below it.

✓ Reading Check

Answer Wegener couldn't explain the force or mechanism that moved the continents.

Visual Learning

Figure 4 Ask students to examine a world map and note the position of mountain ranges. Then have them look at the figure and locate these mountain ranges. Ask them if these mountain ranges could once have been positioned at plate boundaries. **Yes, many mountain ranges were formed through plate tectonic activity. This shows how plate boundaries have changed over time.** [L2]

ELL **LS** Linguistic

Figure 4 Wegener's hypothesis showed mountains on several continents were once part of the same range.

Matching Rocks and Mountains Mountain ranges were shown to be continuous in Pangaea, as shown in **Figure 4**. Once Pangaea broke apart, the mountain ranges became separated. For decades, geologists studied and attempted to explain the origin of these mountains as separate ranges; Wegener showed them to be one mountain range. Wegener was able to show that continents that were joined shared unique rocks and minerals.

Wegener's hypothesis was not accepted by his contemporaries because he was unable to conceive of a force or mechanism that could drive continents apart. Wegener reasoned that Earth's rotation, the gravitational pull of the Sun and the Moon, and centrifugal force could move continents. Physicists quickly showed that even combining these forces would not be sufficient.

✓ Reading Check *Why didn't Wegener's contemporaries accept his hypothesis?*

Wegener used the analogy of continents moving over Earth's surface as ships moving through water. Skeptics argued that this ship would push a wall of water ahead of it and leave a wake. The continents didn't leave a wake. Instead of the continents pushing up a wall of water, they were deformed. How could this be if they were thicker and stronger?

Seafloor Spreading Hypothesis

After World War II, Dr. Harry Hess revived Wegener's ideas. He used sonar, intended to detect submarines, to obtain accurate maps of the seafloor. Using sonar data, astonishing three-dimensional seafloor models were created in 1960. Soon it was apparent that a **mid-ocean ridge** system, or MOR, was continuous and wrapped around Earth. A MOR is shown in **Figure 5**.

Hess proposed a hypothesis of seafloor spreading, or divergence. He suggested that magma from the mantle is forced upward because of its low density. This causes the crust to crack (fault) and move apart. The faulting causes twin mountain ranges with a down-dropped **rift valley** between. This continuous process allows new rock to form as magma fills in from below. See **Figure 6**.

Figure 5 Discovery of a mid-ocean ridge led Hess to hypothesize seafloor spreading.

Differentiated Instruction

Visually Impaired Use a large, raised-relief world map or maps that denote different intervals of elevation with color. Even better, have students work together to develop their own maps. Visually impaired students can work with materials that circumvent their disabilities. For example: red-green color blind students might use blue-yellow colors. [L2] **LS** **Visual-Spatial**

Ages of Sediment and Rocks In the early 1960s, massive programs for drilling into the seafloor began. Extracted cores of seafloor showed that sediments are thicker on top of seafloor basalt near the continents. MOR sediments, however, are thin. Cores of both sediments found that near the continents the oldest sediments are at the bottom and young sediments are at the top. MOR sediments are all of recent age. When the ages of rocks are measured, the continental rocks are billions of years old, while seafloor rocks are less than 200 million years of age. Rocks of the oceanic crust increase in age as their location extends from the MOR, and at the MOR they are new.

Figure 6 A rift valley forms along the mid-ocean ridge as plates diverge.

Applying Math

Solve One-Step Equations

SPREADING DISTANCES The spreading rate along the mid-ocean ridge varies. In the Atlantic Ocean, it averages about 2.5 cm/year. About how far, in kilometers, would the Atlantic seafloor have widened after 100 million years?

IDENTIFY known values and unknown values

Identify the known values:

time = 100,000,000 years

spreading rate = 2.5 cm/year

Identify the unknown values:

spreading distance

SOLVE the problem

Substitute the known values into the equation:

distance = rate $\times$ time

distance = 2.5 cm/year $\times$ 100,000,000 years = 250,000,000 cm

1 km/100,000 cm $\times$ 250,000,000 cm = 2,500 km

CHECK the answer

Does your answer seem reasonable? How wide is the Atlantic Ocean?

Practice Problems

If the East Pacific Rise spreads at 12 cm/year, how wide will it be in 10 million years?

For more practice problems, go to page 879 and visit Math Practice at fl.gpescience.com.

Use an Analogy

Displacement and Distortion

Masses moving through a fluid displace and distort the fluid. When riding a bike, your body pushes against the air. The air moves aside, and your body is not distorted. In Wegener's model, he envisioned the continents getting distorted as they moved, while the oceans and the oceanic crust remained the same. This is actually backward and did not help his argument. [L2]

Applying Math

Math Standards

Florida: MA.B.1.4.2

Teaching Strategy

Remind students of the velocity formula, $v = d/t$.

Answer to Practice Problem

1,200 km

Active Reading

Write-Draw-Discuss This strategy encourages students to actively participate in reading and lectures, assimilating content creatively. Students write about an idea, clarify it, and then make an illustration or drawing. They share responses with the class and display several examples. Have students Write-Draw-Discuss as they read about seafloor spreading.

Sonar In the process of refining sonar's capabilities, discoveries were made that had peacetime benefits. For example, sonar often is equipped on boats to locate schools of fish. A related technique called ultrasound is used in medicine. Use print and online resources to research current uses and applications of sonar and ultrasound. The speed of sound in water is about 1,500 m/sec. If a sonar pulse takes 2 s to reach the sea floor and return to the ship, how deep is the water? Remember that $d = rt$. **The depth is 1,500 m; remind students to take into account the roundtrip time of 2 s.**

Sonar In the process of refining sonar's capabilities, discoveries were made that had peacetime benefits. For example, sonar often is equipped on boats to locate schools of fish. A related technique called ultrasound is used in medicine. Research current uses and applications of sonar and ultrasound.

Figure 7 Large lakes and volcanic mountains are characteristics of a continental rift valley.

Magnetic Polarity of Rocks Studies show that Earth's magnetic field repeatedly reverses itself, meaning that the magnetic north pole becomes the south pole. Vine, Matthews, Wilson, et al discovered bands of reversed polarity in the seafloor rocks similar to those found on the continents. As magma crystals form, they take on the polarity of Earth at the time they form. The pattern is identical on both sides of the MOR.

Theory of Plate Tectonics

Originating in the 1960s, the theory of plate tectonics is relatively new. After seafloor spreading demonstrated that Earth's crust moved horizontally on a global scale, many investigators were determined to understand such a whole-Earth system of movement. This system consists of about a dozen major plates and many minor ones. Plates are composed of a rigid layer of uppermost mantle and a layer of either oceanic or continental crust above. Some plates are composed only of oceanic crust, and some are composed of part oceanic and part continental crust. J. T. Wilson is credited with describing the cycle of repeated opening and closing of ocean basins through Earth's history.

There are three main kinds of plate motions. These are best visualized by considering how plates interact along plate boundaries, where they meet. Plates can move apart, move together, or slide past one another. Although often visualized as narrow boundaries, scientists now consider many boundaries to be wide zones of interaction.

Divergent Plate Boundaries You learned that at a mid-ocean ridge (MOR), magma rises along a faulted rift valley, spreads, and cools to form new oceanic crust. This spreading apart is what happens at **divergent boundaries**. An MOR represents divergence that is well-developed and that has resulted in the production of major ocean basins. In some locations on Earth today, divergent boundaries exist as rift valleys, where no mature ocean basins exist yet, such as in East Africa, shown in **Figure 7**.

Using Science Words

Word Origin Introduce the prefixes used in the vocabulary words from this chapter:

litho = stone

astheno = weak

seismo = shake

epi = upon

Have the students choose two prefixes and list other words with the same prefix. Have them explain how they are related.

Litho = lithography, lithograph—the process of, or writing or engraving on stone **L2** **LS** **Linguistic**

✓ Reading Check

Answer folded mountains

Convergent Plate Boundaries Where plates collide, they come together to form **convergent boundaries**. In some cases, less-dense, thick continental lithosphere moves toward denser, thin oceanic lithosphere. This results in the oceanic side bending and being forced downward beneath the continental slab in a process called **subduction**. Heat along a subduction zone partially melts rock at depth and produces magma, which rises toward the surface. This magma feeds a volcanic arc that parallels this zone, shown in **Figure 8**. The region of collision also has a deep-sea trench that parallels the zone. The Andes mountain range in South America is an example.

Convergent plate boundaries also exist between two slabs of oceanic lithosphere. In this case, the oceanic lithosphere that is colder, and therefore denser, subducts. Magma erupted here produces chains of volcanic islands called island arcs. Japan is an example of an ocean-ocean convergent boundary, also shown in **Figure 8**. As plates converge, stress builds, which could be released as tsunami-causing earthquakes.

Along some convergent plate boundaries, two continental slabs of low density collide and tend not to subduct. Because of this resistance to subduction, the plates collide and buckle upward to form a high range of folded mountains. Volcanic activity is noticeably absent and there is no trench. The Himalaya of Asia are an example of folded mountains that occur where continental lithosphere collides.

Figure 8 When plates collide, the more dense plate is subducted. The resulting features include volcanoes, mountains, and deep trenches.

Science

Topic: Tsunamis

Visit fl.gpescience.com for Web links to information about tsunamis.

Activity Research the most recent tsunami and its destruction. Record the epicenter and magnitude of the earthquake that caused the tsunami and post these data on a world map. Write a short report that describes the tsunami's impact on humans and the environment.

✓ Reading Check

What is formed when two continental plates converge?

Teacher FYI

Compare and contrast the different types of plate boundaries. Some students easily get them confused. Use of overheads and other media may be helpful. Stress the fact that each boundary type has at least one characteristic that differentiates it from the others.

Quick Demo

Mantle Convection

Materials lava lamp

Estimated Time 30 minutes

Procedure Leave the lamp on long enough for convection to become well-developed. Explain that convection currents cannot happen in solids. The presence of these currents is based on an assumption that the layer beneath the crust is not rock solid. The rising and falling blobs of wax in a lava lamp demonstrate mantle convection. Students will learn more about this idea later in the chapter. L2

ELL **Visual-Spatial**

Reading Strategy

Causal Relationships Have students determine the causes of each of the following: sea-floor spreading, divergent plate boundaries, convergent plate boundaries, and transform plate boundaries. Encourage students to make sketches to help clarify cause and effect relationships.

Figure 9 Friction between plates moving side by side causes cracks and breaks in the edges of the plates. This is the site of brief, but rapid energy release called an earthquake.

Transform Plate Boundaries Some boundaries among plates exist as large faults, or cracks, along which mostly horizontal movement is taking place, as shown in **Figure 9**. In this case, no new lithosphere is forming, as along a divergent boundary. In addition, old lithosphere is not being recycled, as along a subduction zone. The main result of **transform boundaries** is horizontal motion of lithosphere.

Transform faults are extremely important where they cut perpendicular to the MOR. These fault systems allow movement away from ridge crests to occur, as shown in **Figure 10**. If you observe arrows that indicate net motion along these transform faults, you will notice that this net motion trends away from the MOR.

What drives the plates?

Research indicates that plates are driven by a combination of forces. One such force is ridge push at the MOR. Because divergent boundaries are higher at the center of the ridge, gravity forces material down the slopes of the MOR.

When a plate subducts back into Earth at some convergent boundaries, the process of slab pull is thought to operate. You probably have experienced an analogy to slab pull when you found your bed covers on the floor in the morning. During the night, as you tossed and turned, the covers began to move off of the bed. Eventually, enough of the covers were over the side that gravity took over and pulled the rest of the covers to the floor. Subducting plates may act in much the same way, as portions of descending plates are pulling the rest of a plate down with them.

Figure 10 A transform fault cuts through the MOR, offsetting the mountain range.

360 CHAPTER 12 Earth's Internal Processes

Post Reading

Time-Line Project Ask students to research the following: continental drift, sea floor spreading, and the theory of plate tectonics. Have students develop a timeline that illustrates the evolution of ideas regarding the movement of Earth's crust.

Teacher FYI

Driving Forces The convection below the surface causes conveyor-belt-like motion at the surface. At the MOR, rising magma causes *ridge push*, friction below the plate causes *plate drag*, and subduction in convergent zones promotes *slab pull*. Treat these as an integrated system driven by internal heating and convection in the mantle.

Friction between a plate and mantle material below the plate probably is of major importance in relative plate motion. For example, plates that drag continental material along with them are noticeably slower than are purely oceanic plates. Scientists think that continental lithosphere has deep roots that cause more frictional force than would be expected at the base of oceanic lithosphere.

✓ Reading Check What role does friction play in plate motion?

Thermal Energy Internal convection of mantle material is the driving force for all mechanisms of plate motion. In turn, the main source of thermal energy that keeps Earth materials convecting comes from the decay of radioactive elements in Earth. Increased temperature due to pressure and frictional heating produced as part of the mechanism itself probably are important. Conversion of secondary earthquake waves in the outer core may yet be another source of energy.

section 1 review

Summary

Continental Drift

- Wegenèr proposed that former super-continent Pangaea broke up into pieces, which drifted to their present positions.
- Evidence favoring continental drift includes matching shorelines of continents and correlating rocks, fossils, and mountain ranges of those continents.

Seafloor Spreading Hypothesis

- Hess suggested that seafloor was created and spread apart at the mid-ocean ridge.
- Moving away from the MOR, rocks are older and sediments are thicker.
- Magnetic reversals preserved in seafloor rocks are symmetrically distributed on either side of the MOR.

Theory of Plate Tectonics

- Earth's rigid, outermost layers are composed of a dozen or so major plates and many smaller ones.
- New lithosphere is created at the MOR and recycled at convergent boundaries. Convective flow within the mantle drives the plates.

Self-Check

1. **Explain** the processes of convergence and divergence.
2. **Describe** the key features of a divergent boundary.
3. **Compare and contrast** the three types of convergent plate boundaries.
4. **Describe** the possible driving mechanisms in the plate tectonic theory.
5. **Think Critically** Predict what would happen if Earth's plates stopped moving.
6. **Think Critically** What would have to occur to stop Earth's plate movement?

Applying Math

7. If two plates diverge at a rate of 1.3 cm/year, how much farther apart will the plates be after 200 million years?
8. How many times faster are plates moving at 7.3 cm/year than those moving at 1.3 cm/year?
9. The average distance across an ocean is 16,000 km. Two continents on either side of the ocean are converging at a rate of 10 cm/year. How long will it take for them to collide?

✓ Reading Check

Answer Continental lithosphere has deep roots which cause friction and slows their movement.

3 Assess

DAILY INTERVENTION

Check for Understanding

Kinesthetic Using thin (oceanic) and thick (continental) blocks of foam rubber, have students model the movements that take place at plate tectonic boundaries. **L2**

ELL

Reteach

Density Differences Using sponges, wood blocks, ceramic tiles, and water, have students model what happens when objects of different densities come into contact with each other. **L1** **ELL** **LS** **Visual-Spatial**

✓ Assessment

Process Have students correctly label sketches of different plate tectonic boundaries. **L2** **ELL**

Visual-Spatial

Create Have each student prepare a quiz-show answer for the category Plate Tectonics. Critique each answer and save the best for a game at the end of the chapter. **L2**

section 1 review

1. During convergence, plates collide and one subducts under the other; during divergence, plates move apart and create a rift valley.
2. mid-ocean ridge in some places, rift valley from which magma flows, new ocean crust forms
3. There is collision at all convergent plate boundaries. Continental-ocean boundaries have volcanic arcs, ocean-ocean have volcanic island arcs, continental-continental generally lack volcanic activity and develop high mountains.
4. All are the result of convection currents in the upper mantle; *ridge push*, divergence due to magma injection; *plate drag*, due to friction between plate and asthenosphere; *slab pull*, due to gravitational pull during subduction in convergent zones
5. Earthquakes and volcanic activity would cease. Erosion would wear down continents to sea level.
6. Earth's core would have to cool.
7. 2,600 km
8. 5.6 times faster
9. 8×10^7 years

Section Focus Transparency Chapter 12

Earthquake Hazards

During earthquakes, buildings and bridges can collapse, roads can be twisted and underground utilities such as electrical, water, and natural gas lines can be broken. Even after the earthquake is over, damaged structures still pose a risk of falling and exposed electrical and gas sources can still be dangerous.

1. How do you think earthquakes affect physical structures?
2. Where are earthquakes most likely to occur?
3. Where do you think would be the safest place to be during an earthquake?

L2

Reading Guide

FCAT Vocabulary

What You'll Learn

- **Describe** the causes and characteristics of earthquakes.
- **Explain** how seismic waves affect Earth's surface.
- **Describe** how seismic waves are used to infer Earth's internal structure.

Why It's Important

Earthquakes kill people and destroy property. Understanding earthquakes may help minimize their effects.

Review Vocabulary

friction: force that opposes the sliding motion between two touching surfaces

New Vocabulary

- **fault**
- elastic rebound
- focus
- epicenter

Global Earthquake Distribution

For decades, scientists have known that earthquakes are not distributed randomly, but rather, they occur in well-defined zones. These zones coincide with the edges of lithospheric plates. In fact, seismic data originating from earthquakes helped to decipher the structure of Earth's ocean floor and to infer the structure and motion of Earth's plates. **Figure 11** shows the distribution of large earthquakes.

Figure 11 Most earthquakes occur along the edges of plates. **Identify** some other places earthquakes occur.

Depth of Focus Patterns develop when data about the focus depths of earthquakes are plotted on a world map. Recall that divergent boundaries are associated with transform faulting that allows plates to move in opposite directions. All of this faulting creates a narrow band of numerous, shallow earthquakes. In contrast, convergent boundaries have broad zones of earthquakes with the shallowest foci near the surface at the point of convergence, and the deepest foci located under volcanoes or mountains created in the collision area, as shown in **Figure 12**.

Figure 12 The depth of the earthquake focus (indicated by the stars) is related to the activity causing the earthquake.

Causes of Earthquakes

An earthquake is any seismic vibration of Earth caused by the rapid release of energy. Earthquake events can be either natural or human-caused. Passing trains or large trucks and explosions can cause Earth to vibrate. As shown in **Figure 13**, sudden, virtually unpredictable, natural earthquakes that result in major destruction are greatly feared.

Deformation Earth's crust is composed of rigid, rocky material. Engineers would describe it as brittle. When a stress is applied to a brittle material it shows little sign of strain, or deformation, until it suddenly breaks. A strain is the manner of deformation in response to a stress. Stress is the force per unit area that acts on a material. Stresses can be of four types:

(1) compressive stress, in which a mass is squeezed or shortened, (2) a tension stress, in which the mass is stretched or lengthened, (3) a shear stress, in which different parts of a mass are moved in opposite directions along a plane, or (4) torsion stress, in which a mass is subjected to twisting.

Figure 13 This damage was caused when the buildings were shaken off their foundations.

Explain How might this damage have been prevented?

SECTION 2 Earthquakes 363

Visual Learning

Figure 13 Have students examine the types of buildings and their construction in the picture, and not the damage. Ask them what might have been done to avoid such damage. *Students might suggest changes to improve building structure, construction farther away from earthquake prone areas, etc.*

2 Teach

Caption Answer

Figure 11 near artificial disturbances, such as bomb blasts

Teacher FYI

Nukes v. Earthquakes There is no real difference between the wave patterns of nuclear bombs and earthquakes. Seismic studies advanced during the cold war because the U.S. thought that it could monitor Soviet bomb testing through seismic monitoring. It didn't work.

Discussion

Earthquake or not? Use photographs of destruction from earthquakes and bomb blasts. Ask students if they can tell the difference. *Earthquake patterns show response to gravity alone—vertically collapsed building or tilted structures. Bomb blasts show an outward, "radial" pattern.* **L2 ELL LS Visual-Spatial**

Fun Fact

Both the U.S. and the former Soviet Union placed their nuclear testing facilities in remote areas that had plenty of natural earthquakes so that their testing would be cloaked.

Caption Answer

Figure 13 The building could be anchored to the foundation; the foundation should be on solid ground.

Reading Strategy

Think Aloud Model this strategy by reading aloud a section of text. Share how you absorb the text. You might say, "I don't understand this paragraph. I need to slow down and reread." Have students brainstorm other ways of comprehending challenging text.

Fun Fact

Meteorologists now use the same pattern identification idea to distinguish between tornado damage and microburst damage. Microburst debris is scattered outward like the spokes of a wheel from a point; tornado debris tends to be scattered along the sides of a "lane" of destruction and may show a hop-and-skip type pattern.

Mini LAB

Purpose Students will model four types of stress and their resulting deformations.

Materials taffy bars

Teaching Strategy Have students keep their palms facing down and hands in constant contact with each other during the entire procedure.

Analysis

1. Step 1: shear;
Step 2: torsion;
Step 3: tension;
Step 4: compression
2. Compression: smooshed, squeezed, folded, compressed, crushed, condensed; Tension: stretched, pulled apart, broken, pulled thin, snapped, drawn out; Shear: shaved off, sliced, split, ground up, scraped, peeled, abrasion; Torsion: twisted, wrenched, wound up, coiled, curled, entwined, spiraled, corkscrewed, turned, torque

Assessment

Oral Have students describe some examples of items they have observed that have been deformed by each of the four types of stress. Use **Performance Assessment in the Science Classroom**, p. 123. [L2]

Mini LAB

Demonstrating Four Types of Stress

Procedure

1. With palms facing down at all times and your hands in contact with each other, clasp a **large bar of taffy** with both hands. First, push one hand forward 2 cm while simultaneously pulling the other backward 2 cm. Return your hands to the original position.
2. Still holding your hands in contact, twist your hands in opposite directions and return them to the original position.
3. Next move your hands about 4 cm apart.
4. Finally push your hands back together to the original position.

Analysis

1. Which type of stress did you demonstrate in each of steps 1–4?
2. Describe the kinds of deformation you would expect to result from each of the four stresses.

Elastic Deformation Elastic deformation occurs when a material deforms as a stress is applied, but snaps back to its origin shape when the stress is removed. Plastic deformation occurs when a material deforms, or changes shape, as a stress is applied and remains in the new shape when the stress is released. Modeling clay behaves plastically. You would expect all rocks to show brittle deformation, which means breaking in response to stress. But rocks at depth, where temperatures are high enough, display plastic behavior. For example, you can break off an edge of a wax candle when it is cold and brittle, but the wax bends more under stress—without breaking—when it warms up.

Energy Release Strain energy builds up along cracks in Earth's crust in response to stress. When this strain energy is released suddenly, it causes rock to lurch to a new position. A **fault** is a crack along which movement has taken place. If no movement takes place, the crack is a fracture. Earthquake-producing faults occur in broad zones in which rock is deformed in a brittle manner during the fault movements. These zones can be tens of meters wide. The sudden energy release that goes with fault movement is called **elastic rebound**. Elastic rebound causes seismic vibrations, or earthquakes, like when you drag a table across the floor and the legs catch and release making a rumbling sound.

Earthquake Waves

Earthquake waves travel out in all directions from a point where strain energy is released. This point is the **focus**, or point of origin, of an earthquake. The point on Earth's surface directly above the focus is the **epicenter**. When you throw a stone into water you see concentric rings of waves move out across the surface from the point of impact. Earthquake waves are much the same, except they move out from the focus in all directions, like a sphere of waves. These ideas are shown in **Figure 14**.

Earthquake waves can be sorted broadly into two major types. Body waves travel through Earth. Surface waves travel across Earth's surface.

Figure 14 Waves moving out from the focus may travel through the mantle. These may be picked up by seismographs on the opposite side of Earth.

Body Waves One type of body wave is called a primary wave. Primary waves, also called P-waves, cause particles in a material to undergo a push-pull type motion as shown in **Figure 15**. Because this motion is in the direction of wave travel, the wave energy is transferred very quickly. The particles do not permanently change location. If there is matter around where particles can bump into each other, then primary waves can move through it. Much like sound waves, P-waves travel through all kinds of matter.

Secondary waves (S-waves) are body waves that travel more slowly than primary waves. They are sometimes called shear waves, because of the relative motion of particles as energy is transferred. S-waves cause particles to move perpendicular to the direction of wave travel. The farther body waves travel from an earthquake focus, the farther behind the S-waves get. It is this lag in time between the arrival of the first P-waves and the first S-waves that is important in locating epicenters.

S-waves only can travel through solids. When one particle moves, it moves its neighbors along with it. In gases and liquids the bonds are weak, or there are no bonds, so particles can move independently. The motions of S-waves are shown in **Figure 16**.

Figure 15 P-waves are compressional waves like those moving in a coiled spring.

Describe How are P-waves like sound waves?

Quick Demo Wave Motion

Materials toy spring

Estimated Time 10 minutes

Procedure Demonstrate the action of P-waves and S-waves. This is best done on the floor or a long table. A rope tied to a doorknob can be used to model S-wave movement.

Activity

Turn the Quick Demo into an activity. Provide groups with toy springs or ropes and have them investigate how the waves change with different energy inputs or different lengths of input movement, i.e. short v. long push-pull movement to make P-waves, or short and long side-to-side movement for S-waves. **L2 ELL LS**

Visual-Spatial

Caption Answer

Figure 15 Both waves are compressional and both need particles that can bump into one another.

Figure 16 S-waves cause the earth to undulate creating surface damage.

Fun Fact

There are thousands of earthquakes every day—most are too small to even report. Show students a world map plotting the distribution of different magnitude earthquakes.

Figure 17 During an earthquake the surface can roll like the ocean and shift side to side at the same time.

Surface Waves Surface waves move in a more complex manner, often causing a rolling motion much like ocean waves. As surface waves travel through material, they can exhibit an up and down rolling motion, and also a side-to-side motion that parallels Earth's surface. Foundations of human-built structures often are susceptible to the side-to-side rocking that might result from surface waves. These surface wave motions are illustrated in **Figure 17**.

Table 1 Estimates of Earthquake Magnitude and Frequency

Richter Magnitude Range	Description Index	Estimated Occurrence per Year
< 2.0	recorded, but not generally felt	600,000
2.0–2.9	potentially felt	300,000
3.0–3.9	felt by some	49,000
4.0–4.9	felt by most	6200
5.0–5.9	damaging	800
6.0–6.9	destructive in densely populated areas	266
7.0–7.9	potential to inflict major damage	18
8.0 and above	potential to destroy communities near epicenter	1.4

Cultural Diversity

Stories from Home Have students from another culture describe their culture's beliefs and attitudes toward earthquakes, particularly if the student comes from a place that has frequent earthquakes.

Earthquake Measurement

Two measurement schemes that have been used to characterize earthquakes are the Modified Mercalli intensity scale and the Richter magnitude scale. Intensity is a measure of ground shaking and the damage that it causes. The Modified Mercalli scale, **Table 2**, ranks earthquakes in a range from I–XII, XII being the worst, and uses eyewitness observations and post-earthquake assessments to assign an intensity value. The Richter magnitude scale, Richter scale for short, uses the amplitude of the largest earthquake wave. Richter magnitude is intended to give a measure of the energy released during the earthquake. **Figure 18** shows a seismogram and how it is used to determine a Richter value. **Table 1** shows the global frequency of different magnitude earthquakes.

Figure 18 A seismograph is an instrument used to measure earthquake waves. A seismogram is a tracing of the seismograph's pen.

Table 2 The Mercalli Scale of Earthquake Intensity

Level	Description
I	Rarely felt by people.
II	Felt by resting people indoors; some hanging objects may swing.
III	Felt indoors by several. Vibration like passing of a light truck.
IV	Felt indoors by many. Vibration like passing of a heavy truck. Standing autos rock. Windows, dishes and doors rattle. Walls and frames may creak.
V	Felt by nearly everyone indoors and outdoors. Small unstable objects upset. Some dishes and glassware broken. Swaying of tall objects noticed.
VI	Felt by all. Walking is unsteady, many run outdoors. Windows, dishes, and glassware broken. Furniture overturned and plaster may crack.
VII	Difficult to stand. Noticed by drivers of autos. Furniture and chimneys broken. Well built buildings hardly damaged. Poor structures considerable damage.
VIII	People frightened. Ordinary buildings slightly damaged. Driving of autos affected. Tree limbs fractured. Damage to tall objects. Cracks in wet ground.
IX	General panic. Damage great in substantial buildings. Some houses thrown off foundations. Underground pipes broken. Serious ground cracks.
X	Most masonry and frame structures destroyed. Serious damage to dams, dikes, embankments. Water splashed out of rivers, canals, lakes. Rails bent.
XI	Few structures remain standing. Bridges destroyed. Broad fissures in the ground. Slumps and landslides. Rails bent generally.
XII	Damage nearly total. Waves seen on ground surfaces. Lines of sight and level distorted. Objects thrown into the air. Large rock masses displaced.

367

Discussion

Shaky Earth Ask the students for ways that Earth might be vibrated other than fault movement. Stress that scale makes a difference. **bomb blasts (nuclear), pounding of surf, heavy trucks, railroad trains, people walking/running, etc;** All are detectable by modern seismic equipment. L2

Inquiry Lab

Earthquake Magnitude Scale

Question How can you design a model of an earthquake magnitude scale?

Possible Materials pennies, nickels, foreign coins, metric ruler, meterstick, magazines, paperback books, heavy books.

Estimated Time 30 minutes

Teaching Strategies

- Students can stand coins on their ends and drop different-sized books from uniform heights and distances to measure the "earthquake" size produced by each item. Students can experiment with placing different-sized coins and different numbers of coins on a flat surface to establish a magnitude scale and to measure the vibrations of different-sized books. They also can fine-tune their measurement systems by placing the coins at different angles with respect to the falling books.
- Encourage students to experiment with the magnitude of vibrations passing through different surfaces such as tile, carpet, and wood.

For additional inquiry activities, see *Science Inquiry Lab Manual*.

Visualizing Earthquake-Proof Buildings

Have students read the information and examine the pictures. Then ask the following questions: Why do some parts of the world experience more earthquakes than others? **Locations that are close to plate boundaries often experience more earthquakes.** Why do earthquakes of the same magnitude destroy buildings in some parts of the world, but not in others? **Different localities have different regulations and building codes.** Why do similar buildings within a city collapse, while others remain standing? **The nature of the soil and rock material under some buildings can magnify vibrations.** Buildings located on wet soil, loose sediment, and land-filled areas often experience more damage.

Activity

Earthquake Proofing Have students use wooden blocks to build structures on a table. Vibrate the table until the structure collapses. Have students devise methods of reinforcing their structures to withstand the vibrations. Test their new structures after they have been reinforced.

Figure 19

Because the most severe damage from an earthquake is not caused when a structure shakes, but when it falls down, engineers are developing ways to make buildings safer. Their job is to prevent the energy of an earthquake from damaging a building's structure.

What happens when the ground moves back and forth under a building? The first floor moves back and forth, but the energy is not transferred to the whole building. The result is that the bottom of the structure collapses.

One way to keep the building stable is to design a system that allows the whole structure to move as a unit. Base isolation systems use bearings that separate the building from the ground. These bearings can be made of large rubber pads or giant metal springs and are placed between the ground and the building support beams. The stretchy rubber or metal spring absorbs the earthquake energy.

Another way to protect buildings in an earthquake is active damping. Large blocks of metal or concrete, weighing many tons slide back and forth as the building sways. The pendulum motion of the damper absorbs the energy of the earthquake, and reduces the movement of the building.

Buildings also can be protected by using structures that can bend. These diagonal braces, called unbonded braces, are made of steel and concrete. The steel beam is shaped so that it can bend back and forth without breaking. The building moves but it does not collapse.

368 **CHAPTER 12** Earth's Internal Processes

Differentiated Instruction

Challenge The gigantic steel ball, shown above in the third photograph, is called a tuned mass damper. It is situated on the 89th floor in the tallest building in the world—the Taipei 101 Building, in Taipei, Taiwan. Have students research this object to discover how it is intended to avert or mitigate earthquake damage. Students can share their discoveries with the class by preparing demonstration models or posters and performing a class presentation.

Levels of Destruction The level of destruction by earthquakes is extremely variable. Research has shown that poor building methods are the largest contributors to earthquake damage and loss of life. In countries where there are poorly constructed buildings, it is not uncommon for tens of thousands of people to die in a single earthquake event. It is possible to use high-technology building methods to make structures earthquake resistant, but not earthquake proof. A large proportion of earthquake damage is secondary, such as damage by landslides, fires, and tsunamis. Active earthquake zones are well established, but predicting precise times for earthquakes in those zones is not yet possible.

Earthquake Proofing Although no building can be made entirely earthquake proof, scientists and engineers are finding ways to reduce the damage to structures during mild or moderate earthquakes. Much damage occurs when older structures are shaken off their foundations, so securing a building to its foundation is important. Large masses that can move with the earthquake absorb energy to make a building more secure. **Figure 19** shows some other possible methods for reducing the effects of earthquakes and making buildings safer.

Post Reading

Extended Research Have students research a particular earthquake. Ask them to develop a poster or paper that describes the fault movement, wave generation, and effects of the quake. Students can present their poster to the class.

3 Assess

DAILY INTERVENTION

Check for Understanding

Auditory-Musical Because earthquake waves and sound waves have different frequencies, have students write lyrics and an appropriate rhythm pattern for different-frequency P and S waves. **Sound does not produce S waves except in solids.** [L2] [ELL]

Reteach

Mold a block of plasticene into a rectangle about 3 cm thick. Demonstrate plastic deformation by steadily pulling the block apart. Then demonstrate brittle deformation by quickly pulling the block apart. It should snap apart. Compare how much of the block is deformed in both instances. [L1]

[ELL] Visual-Spatial

Assessment

Create Have each student prepare a quiz-show answer for the category Earthquakes. Critique each answer and save the best for a game at the end of the chapter. [L2] [PBL]

section 2 review

Summary

Global Earthquake Distribution

- The majority of earthquakes occur at varying depths, and in zones that define the locations of plate boundaries.

Causes of Earthquakes

- Earthquake waves are the result of elastic rebound in faults.

Earthquake Waves

- Body waves move throughout Earth.
- Surface waves move along Earth's surface. Their motions cause the majority of earthquake damage.

Earthquake Measurement

- The Modified Mercalli scale is a subjective damage scale that indicates earthquake intensity.
- The Richter magnitude scale measures amplitudes of waves generated by an earthquake. Energy released by an earthquake are estimated from amplitude data.

Self Check

- Describe the elastic rebound process.
- Contrast primary and secondary seismic waves.
- Compare and contrast the Richter scale with the Mercalli scale.
- Summarize the patterns of global earthquake distribution.
- Think Critically Why couldn't you use the Mercalli scale to measure an undersea earthquake?

Applying Math

- Calculate If a primary earthquake wave travels at a rate of about 6 km/s through continental crust, how long will it take it to reach a seismic station located 1,200 km away?
- Calculate If the secondary wave travels at 10 km/s to the same station in question 6, how much longer will it take for the secondary wave to arrive after the primary wave?

More Section Review fl.gpscience.com

SECTION 2 Earthquakes 369

section 2 review

- Stress builds up along a fault. When the rock can no longer resist the stress, rock on either side of the fault snaps to a new position, releasing energy.
- Primary waves are waves of compression, have high velocities, and cause matter to move in the direction of wave motion. They can travel through all matter. Secondary waves are waves of translation, have low velocities, and cause matter to move at right angles to the direction of wave motion. They can only travel through solid matter.
- difference in arrival time of primary and secondary waves, velocity graph for both P and S waves, and location of at least three cities that have a record of the earthquake
- Most earthquakes occur at plate margins.
- The time difference between P- and S- wave arrival at the epicenter allows for calculation of focus depth. San Andreas Fault is a transform fault and foci are usually shallow.
- 200 seconds or 3.33 minutes
- 80 seconds or 1.33 minutes

Reading Guide

What You'll Learn

- **Explain** how geologists infer the structure of Earth's deep interior.
- **Describe** Earth's internal structure and composition.

Why It's Important

Using waves to indirectly determine the internal structure of an object has many applications in the sciences and engineering.

Review Vocabulary

refraction: the bending of a wave as it changes speed in moving from one medium to another

New Vocabulary

- discontinuity
- shadow zone
- asthenosphere

What's inside?

How is it possible to know anything about the interior of Earth? In 1961 scientists drilled a 200 m deep hole into the oceanic crust trying to reach the Mohorovicic discontinuity. The project was discontinued after Phase I. It is 6,371 km to the center of Earth. By human standards, this attempt was barely a scratch on Earth's surface. Imagine adding this feature to the diagram in **Figure 20**.

Figure 20 Also known as the Moho layer, the red line below was the target of the 1961 Mohole Project.

Infer why they attempted to drill through oceanic crust instead of continental crust.

Uniform Earth? If Earth was uniform in structure and composition, and you knew how fast earthquake waves traveled through its material, then it would be easy to calculate when earthquake waves should be detected on its opposite side. Observations show that seismic waves arrive at different times than expected. In order for seismic waves to change speed, Earth must not be uniform throughout. If Earth is not uniform, then is there a pattern to its interior structure?

Earthquake Observations

As seismic wave recording stations began to spread over Earth, new discoveries were made as seismic wave data from earthquakes were interpreted. Observations of refracted waves show that the waves do indeed bend as they encounter sharp changes in density. A boundary that marks a density change between layers is called a **discontinuity**. One such discontinuity separates the crust from uppermost mantle, and is known as the Mohorovicic (moh huh ROH vee chihch) discontinuity, or Moho, illustrated in **Figure 20**.

Shadow Zones Observations show that, from a given epicenter, P-waves and S-waves travel through Earth for 105 degrees of arc in all directions. Between 105 and 140 degrees from the epicenter, nothing is recorded. This “dead zone” is termed the **shadow zone**. From 140 degrees to 180 degrees (directly opposite the epicenter), only P-waves are recorded.

Shadow zones reveal two interesting facts about Earth’s interior. Because S-waves seem not to appear on seismographs located beyond 105 degrees from an epicenter, scientists think that there is a layer of Earth that is absorbing them. In fact, these waves are thought to be converted to P-like waves in the outer core. Recall that S-waves only travel through solids. This suggests that the outer core is in a liquid state. See **Figure 21**.

If you move an energy source all around an object, you would eventually be able to compile many different views and describe the three-dimensional shape of the object. This process is called tomography and is the way Magnetic Resonance Imaging (MRI) can show doctors the inside images of the human body. With earthquakes happening all over the globe, seismologists have thousands of point sources of energy, and can construct a tomographic view of the core.

Solid Inner Core The fact that P-waves pass through the core, but are refracted along the way, indicates that the inner core is denser than the outer core and solid. The state of a particular material depends on both pressure caused by the weight of overlying material and temperature. When pressure dominates, atoms are squeezed together tightly and exist in the solid state. If temperatures are high enough, atoms move apart enough to exist in the liquid state, even at extreme pressures.

Figure 21 S-waves only travel through solids so they cannot penetrate the liquid outer core, creating shadow zones.

SECTION 3 Earth’s Interior 371

2 Teach

Text Question Answer

Yes, Earth appears to have a layered structure.

Caption Answer

Figure 20 Oceanic crust is thinner.

Quick Demo

Earth’s Layers

Materials clay, clear straw, plastic knife

Estimated Time 15 minutes

Procedure Construct a 20-cm model of Earth using concentric layers of clay. Use a clear straw to drill into the sphere and extract a core that shows layering. Slice a wedge out of model to show layering. Ask students if this is how we know that the Earth has a layered structure.

Possible answers: No, earthquake wave patterns are used to infer layered structure. Drilling and mining don’t go deep enough. [L2] [ELL] [LS] **Visual-Spatial**

Discussion

Seeing Earth’s Layer’s Ask students what methods, other than drilling and mining, might be used to visualize Earth’s interior. **Possible Answers:** X-rays, lasers, or ultrasound (won’t penetrate rock), sonar or radar (reflected). Low frequency waves from blasts or natural earthquake waves will penetrate and refract or reflect to reveal interior. [L2]

Activity

Calculate Use your school’s football field to model a cross section of Earth. Have one goal line be the center of Earth and one be the surface of Earth. Have students calculate on what yard line the inner core would end, outer core, etc. Have students stand on these boundaries. center = goal line; inner core = 19.2 yards; outer core = 54.5 yards; lower mantle = 89.5 yards; asthenosphere = 96.9 to 98.5 yards; upper mantle = 99.6 yards; surface = 100 yards [L2] [ELL] [LS] **Logical-Mathematical**

SECTION 3 Earth’s Interior 371

Reading Strategy

Question a Partner Before reading, ask students to develop questions based these topics: shadow zones, Earth’s interior structure, and the composition of Earth’s layers. After reading, have students work in pairs to ask and answer questions.

Differentiated Instruction

Learning Disabled Have these students be the field crew for the football field Earth activity in this Section. Have them count off the yards and place the markers. Colored flags might be used to represent the boundary of each layer. For example: white = center; light yellow = inner core; goldenrod = outer core; tan = lower mantle; red = asthenosphere; orange = upper mantle; brown = surface

Post Reading

Science Journal Ask students to write a response to the following prompt: What do scientists know about Earth's interior? How do they know this? Have students share their thoughts with a partner or with the class.

Visual Learning

Figure 22 Display cross-sectional drawings of all nine planets in our solar system. Remove any identifying labels. Ask students to identify Earth and explain their choice. Ask what all the planets seem to have in common. Then refer students to the figure to confirm their selection. *Be prepared to give clues about Earth's layer composition. All the planets are alike in that their layers increase in density toward the center.* L2

Figure 22 Layering of Earth is caused by heat and pressure. The most dense materials are at the center and the less dense materials are near the crust.

Composition of Earth's Layers

Earth's internal layers, illustrated in **Figure 22**, generally become denser with depth. The crust and uppermost mantle, which together form the lithosphere, are made of rocky material—mostly silicates. The **asthenosphere** is a weaker, plasticlike layer upon which Earth's lithospheric plates move. Much like the lithosphere, mantle below the asthenosphere also is composed of silicates, but the minerals present have different structures in response to conditions of higher pressure. The cores are made mostly of metallic material, such as iron and nickel with noticeable amounts of oxygen and sulfur also present. The core apparently has a composition similar to some iron meteorites that have struck Earth throughout its history.

Astronomers hypothesize that early Earth may have formed from meteorite-like material that was forced together by gravity and heated to melting. Some of the material then was able to migrate toward the core. Over billions of years, Earth's matter has melted and differentiated. The densest materials settled toward the core, and relatively low-density materials floated toward the surface. This differentiation due to gravity is thought to have taken place in all of the planets.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students identify the various layers of Earth's interior, their compositions, and states of matter. Ask how we know the thickness and the state of matter of these layers. L2

Reteach

Seismic Wave Movement Using **Figure 24**, discuss the relationship between P and S waves and their movement through Earth. Point out the liquid layers and explain that S waves do not travel through the outer core. L1 ELL

section 3 review

Summary

What's inside?

- Earthquake-generated seismic waves provide information about Earth's deep interior.

Earthquake Observations

- Earth's interior has a layered structure.
- Earth's layers become denser with depth.
- Changes in density occur at layer boundaries called discontinuities.

Composition of Earth's Layers

- Layers of crust and mantle are rocky, and composed mainly of silicates.
- The cores have a high density, metallic composition.
- Composition of Earth closely resembles the composition of meteorites.

Self Check

1. **Describe** the evidence used for subdividing Earth's interior into layers.
2. **Explain** the following points, using seismic evidence for your argument:
 - a. Earth has a non-uniform density.
 - b. Earth has a layered structure.
 - c. Earth has a liquid outer core.
3. **Compare and contrast** the inner and outer cores of Earth.
4. **Think Critically** Explain why it is impossible to ever really know what materials compose Earth's interior.

Applying Math

5. **Calculate** What percent of the mantle are the upper mantle, lower mantle, and the asthenosphere?

section 3 review

1. refraction of P and S waves; seismic waves arriving at different times; and absorption of S waves
2. a. Seismic waves arrive sooner than expected if all of Earth had a density equal to the crust, the conclusion is that density must increase toward the core.
3. Both have a metallic composition; outer core is liquid, inner core is solid.
4. It is impossible to extract actual samples.
5. Upper mantle 21%
Lower mantle 72%
Asthenosphere 7%

Assessment

Create Have each student prepare a quiz-show answer about Earth's interior. Critique answers and save the best for a game at the end of the chapter.

Volcanoes

Reading Guide

What You'll Learn

- **Describe** the types and causes of different types of volcanic eruptions.
- **Explain** the pattern of occurrence of volcanoes and its link to plate tectonics.

Why It's Important

Volcanic eruptions have an impact on the composition of the atmosphere and on climate.

Review Vocabulary

melting point: temperature at which a solid begins to liquefy

New Vocabulary

- viscosity
- cinder cone volcano
- shield volcano
- composite volcano

Origin of Magma

Recall that faults are weaknesses in Earth's crust along which movement takes place. This movement results in a local decrease in pressure, called decompression. With less pressure, the melting point of rock material decreases, but the temperature can remain the same. Hot, nearly molten rock in Earth's asthenosphere, considered an important source for molten rock material, can change to a liquid by decompression melting. Rising magma can become more fluid as it decompresses, particularly if its gas content is high.

Any molten rock material has a lower density than that of its solid counterpart. Because of this density difference, a buoyant force acts on magma that forms from rock surrounding it. Rising magma may reach Earth's surface if pressure conditions allow and the rock has conduits through which it can flow.

Imagine hot magma rising through the crust, creating brittle deformation near the surface in the form of fractures or faults. The cracks in turn cause a drop in pressure, and more paths are available through which magma can move toward the surface, as shown in **Figure 23**. This causes more deformation until magma reaches Earth's surface as a volcanic eruption.

Figure 23 Less dense, liquid rock rises to the surface through cracks and fissures creating a volcano.

Under the Volcano

Chapter 12

In 79 A.D., Mount Vesuvius erupted near the Roman city of Pompeii. Dust, ashes, cinders, and rocks flew high into the air. During the first eight hours of the eruption they fell on Pompeii to depths of eight to ten feet. In the next stage of the eruption, a superheated cloud of steam and mud flowed down the side of Vesuvius and covered the town of Herculaneum.

1. Based on the description, what kind of volcano was Mount Vesuvius?
2. What could the people of Pompeii and Herculaneum have done to save themselves?
3. What might modern scientific knowledge have done to help minimize the damage?

L2

Reading Preview

Tie to Prior Knowledge

Melting/Freezing Point Most materials have a temperature above which they exist in nature as a liquid; and below it as a solid. L2

Word Associations Have students scan the text to find images and ideas that are associated with the new vocabulary terms. For example, while thinking of the word *viscosity*, students might consider the analogy of cold and warm flowing syrup. Using either phrases or sketches, students should record word associations.

2 Teach

Quick Demo

Dissolved Gases

Materials tap water, carbonated water, mixture of tap and carbonated water, clear bottles with lids (3)

Estimated Time 15 minutes

Procedure Provide students with the three solutions in clear, capped plastic bottles. Shake each bottle vigorously, uncap, and observe the reactions.

Ask them to estimate the amount of dissolved gas in each container. Ask how this would relate to a volcanic eruption. The tap water is like magma that has little dissolved gas and is a quiet eruption; the mixture is like a lava that is not very thick, has some dissolved gas and is somewhat explosive; the carbonated water is like thick lava that has a lot of dissolved gas and is explosive. [L2]

ELL Visual-Spatial

Teacher FYI

Gas Composition Magmatic gases are usually composed of water vapor or carbon dioxide. Smoke seen coming from erupting volcanoes is usually a mix of volcanic ash and condensed water vapor.

Figure 24 Volcanoes are common in subduction zones. Friction, conduction, and convection may all play a role in creating fissures through which a volcano may erupt.

Magma on the Surface Two major physical settings on Earth produce most lava flows at the surface. Eruptions most commonly are found near boundaries that separate tectonic plates, above mantle plumes or hot spots on continents or in the ocean basins. Figure 24 illustrates these volcanic settings.

Eruptive Products

Volcanoes expel a wide variety of materials. These materials can be sorted first by their state of matter. Volcanoes erupt lava, gases, and chunks of solid material.

Solids All solid materials expelled by a volcano are collectively called pyroclasts. Often, lava is ejected into the air as globules. These globules cool and solidify as they fall to Earth. The smallest particles cool very quickly and form volcanic ash. Larger globules form streamlined, volcanic bombs. In addition to chunks that cool as they fall, there often are chunks of already solid material ripped away from the conduit of the volcano as material travels through it. These chunks of rock are termed volcanic blocks. The larger the size of a pyroclastic particle, the closer it will fall to the volcano. Blocks fall back to ground on a volcano's flanks. Ash can be picked up by wind and blown hundreds or even thousands of kilometers away.

Science online

Topic: Huge Eruptions

Visit fl.gpscience.com for Web links to information about the world's most powerful volcanic eruptions.

Activity In your Science Journal, list information, including dates and locations, of ten of the world's most powerful volcanic eruptions. On a copy of a world map, plot the locations of these events. Is there a pattern to their occurrence in place or in time?

Science Journal

Internal Activity Have students keep a current events page for all of the volcanic and earthquake activity that takes place worldwide during the time you spend on the chapter. Encourage them to look for government internet sources that report daily Earth activity. [L2] P

Gases Volcanoes release a broad variety of superheated gases, the most common of which is water vapor. In addition carbon dioxide and gases composed of sulfur compounds are expelled high into the atmosphere. There is strong evidence that volcanoes are major contributors of greenhouse gases that can affect climate long after an eruption is over.

Liquids Magma from a volcano or fissure may remain a liquid, at least initially, and flow across the Earth's surface as lava. Lavas can vary considerably in composition, which in turn affects their physical properties.

Viscosity is a measure of the resistance of a fluid to flow. The temperature of molten rock material influences its viscosity. You have experience with temperature control on viscosity when you try to pour cold pancake syrup. It has a high viscosity when it first comes out of the refrigerator. But, let it warm up and it flows more easily because its viscosity decreases. Other factors that affect viscosity and flow are gas content and composition.

Low-viscosity lavas are generally basaltic in composition. Basaltic lavas are low in silica (SiO_2) content, and high in certain chemical elements such as calcium, magnesium, and iron. Basaltic lavas flow from fissures—such as along the MOR and zones of continental rifting, and also from hot spot volcanoes. They tend to flow easily and form huge volcanic forms such as shield volcanoes and flood basalts, both of which cover large areas on Earth's surface.

If lavas have large quantities of gas dissolved in them, then the viscosity is lowered. High gas quantities allow magma to forcefully migrate through rock, sometimes spewing out explosively as a lava fountain that behaves much like a geyser!

Eruptive Styles

Volcanoes can erupt in many different ways, depending on viscosity. Thick, sticky, high-silica magmas are so viscous that they tend not to erupt, causing internal pressure within a volcano to rise. When Earth's crust fails under such high pressure conditions, a violently explosive eruption occurs. This style of eruption is characterized by abundant pyroclasts. In contrast, the runny, low-silica, high-temperature basaltic lavas are so low in viscosity that they erupt quite easily and often produce quiet eruptions of freely flowing lava. Eruptive style is strongly linked to temperature and composition, factors that are hard to measure until after an eruption. Temperature and composition of a magma that ultimately erupts as lava can be linked to the type of plate boundary associated with it.

Modeling Lava Viscosity

Procedure

1. Mix a small batch of batter from **pancake mix** according to directions.
2. Mix a second small batch, but use 25% more **milk**.
3. Hold your finger under a **small funnel** and fill the funnel with the first batch of batter.
4. Have a partner hold a **watch with a second hand**. Remove your finger and time how long it takes the funnel to empty. Record your data.
5. Clean the funnel and repeat step 4 using the second batch of batter.
6. Gently heat a **small pan** on a **hot plate**.
7. Pour part of the first batch of batter on the pan and observe.
8. Repeat step 7 using the second batch of batter.

Analysis

1. Which batter made the flattest pancakes? Explain why.
2. Compare and contrast the properties of the batters.
3. Which batter modeled low-silica lava?

Video Lab available.

Purpose Students will model viscosity.

Materials pancake mix, water, spoon or whisk, plastic spatula, plastic measuring cup with pouring lip, small funnel, watch with second hand, non-stick pan, hot plate, oil (optional)

Teaching Strategies Stress careful measurement so that batters have noticeably different textures.

Safety Precautions

Analysis

1. 25% more water; has a lower viscosity
2. both have similar ingredients; one has more water and is runnier
3. the runny batter is more like low-silica (basaltic) lava

Assessment

Oral Ask students to give other examples of viscosity differences. **road tar or syrup at different temperatures; flour or corn starch added to foods as a thickener** [L2]

Discussion

Additional Dangers Have students list the ancillary events that might occur during and after a volcanic eruption. **earthquakes, collapsed structures from weight of ash, thunderstorms, forest fires; if volcanoes are ice-capped, then flooding, and mudflows** [L3]

Caption Answer

Figure 26 Pinatubo, Fujiyama, Mt. St. Helens, Paricutin

Activity

Identify Display a variety of rocks, some of which are volcanic (extrusive igneous rocks). Ask the students to select those that are volcanic and justify their choices. Recall volcanic rock may have gas bubble holes (vesicular), will be fine grained or glassy. **L2** **ELL** **LS** **Visual-Spatial**

Reading Strategy

Discussion Groups Form groups of three or four students. Assign a facilitator and recorder in each group. Ask students to hold a discussion using the following questions as prompts: Where does magma form and how does it move to the surface? What happens during a volcanic eruption? Where are volcanoes commonly found?

Figure 25 Many volcanoes occur on Earth along plate boundaries, over hot spots, or in rift valleys.

Plate Boundary Setting Look at **Figure 25**. Most of Earth's volcanoes are located along the Ring of Fire, which rims the Pacific Ocean. They lie in subduction zones where continental and oceanic materials are being mixed and partially melted. This plate motion and the associated melting create a wide variety of magma types that can potentially erupt. Large earthquakes and violent volcanic eruptions often are located along these ocean-continent and ocean-ocean convergent boundaries.

Divergent plate boundaries also are volcanically active, but most of the activity is underwater, along the MOR, and goes unnoticed by most people. There are places where divergence takes place on land and you could witness its associated volcanic activity. Iceland and the East African Rift Valley are examples of land areas that are part of divergent boundaries. Lava erupted in these settings is generally low-viscosity and basaltic in composition.

Hot Spots Hot spots are volcanically active sites that arise in places where large quantities of magma move to the surface in large, column-like plumes. Scientists think that plumes are positioned according to internal convection patterns within the mantle, and some may originate at the core-mantle boundary. It seems that hot spots do not move much, but the plates move over them. When a hot spot occurs under an oceanic plate, this stable source of hot magma forms volcanic island chains. The Hawaiian islands are such a chain. Yellowstone National Park is an example of a hot spot under a continental plate. When a volcano moves off the hot spot it becomes inactive.

Hot spot volcanic eruptions produce lava somewhat similar to that formed along divergent boundaries, but they are not an exact match. These lavas tend to contain greater abundances of alkali metals such as potassium and sodium. Like MOR lavas, hot spots, which can occur far from a plate boundary, tend to generate fluid, basaltic lavas. But their compositions can change as magmas penetrate rock material of changing composition, like in continental crust.

Science online

Topic: Mt. Pinatubo

Visit fl.gpescience.com for Web links to information the 1991 eruption of Mt. Pinatubo in the Philippines.

Activity Construct a time line for this eruption. Begin with precursors, which are events that indicate volcanic activity is imminent, and end with long-term effects after the eruption.

LAB DEMONSTRATION

Purpose Demonstrate the effect of silica content on lava viscosity

Materials 250-mL beaker, graduated cylinder, stirring rod, table salt, liquid hand soap

Procedure Pour 120 mL of hand soap into a 250-mL beaker. Stir the liquid with a stirring rod. Describe the viscosity. Add 30 g of

NaCl (table salt) to the liquid. Stir well. Describe what happens. Repeat the procedure three more times by adding 30 g of NaCl, stirring, and observing. Describe what happens.

Expected Outcome The liquid will become thicker with each addition of the salt.

Assessment

Ask the students what the liquid and the salt represent in terms of volcanoes. What is the relationship between the salt and soap and lava and silica? *The soap represents lava and the salt represents silica. Just as the salt thickens the soap, silica thickens lava.* **L2**

Types of Volcanoes

Volcanoes are classified according to their size, shape, and the materials that compose them. Recall that eruptive materials that form a volcano are related to the physical properties of its magma source. The temperature, composition, and gas content of magma are important controls on the type of volcanic structure that forms during an eruption. **Table 3** summarizes the characteristics of main types of volcanoes.

Cinder Cone Volcanoes When eruption of gas-rich magma takes place, eruptive products often are spewed into the air explosively as large chunks. These large pyroclastic materials may pile up near the exit hole, or vent. When the primary eruptive products are large fragments of solid material, **cinder cone volcanoes** form. They tend to be small, with most cones having heights in the hundreds of meters range. When cinder cones occur on the flanks of larger volcanoes, they are called parasitic cones. An example of a volcano with parasitic cones is Mount Kilimanjaro in the African rift valley.

Reading Check What are the characteristics of cinder cones?

Shield Volcanoes Because they form from high-temperature, fluid, basaltic lava, **shield volcanoes** erupt with abundant lava flows that can move for kilometers over Earth's surface before stopping. Shield volcanoes are broad, flat structures made up of layer upon layer of lava. Think of pancake batter. If the batter is cold or thick, it piles up and you get thick pancakes. Add more milk and make a runny batter, and it flows easily across the skillet and makes thin pancakes. Volcanism in Hawaii produces shield volcanoes.

Volcano Eruptions

Volcanic eruptions can throw tons of ash into the atmosphere where winds carry the ash around the world. The ash blocks sunlight and affects plant growth. Scientists measure fossilized tree rings to infer the affect ancient volcanoes had on Earth. Research the amount of ash produced by Mount Pinatubo and how quickly it circled the globe.

Reading Check

Answer small, made up of cinders and pyroclastic materials, heights in the hundreds of meters range

Post Reading

Create a Chart Have students develop a chart to describe characteristics of volcano types, including cinder cones, shield volcanoes and composite volcanoes. Remind them to include information regarding magma composition, shape of the volcano, and locations around the world.

Table 3 Comparison of Melt Properties

Composition	Silica Content	Gas Content	Viscosity	Volcano Type
Basaltic	lowest	least (1-2%)	lowest	shield, fissure eruptions (such as MOR)
Andesitic	intermediate	intermediate (3-4%)	intermediate	composite
Rhyolitic	highest	highest (4-6%)	highest	volcanic dome

Differentiated Instruction

Learning Disabled Have students use modeling clay to make and label models of the three principle forms of volcanoes. Help them to recognize the relationship between the height and width ratios and overall size. **L1 ELL**

Visual-Spatial

Curriculum Connection

Geography The spatial content of this chapter can be summarized on a world map with earthquake zones, volcanic zones, and plate tectonic boundaries plotted on it. Decide how much data to provide on the map and how much is to be added by the students. Once the map is completed have students use a world atlas to identify countries with particular connection to these geologically hazardous zones.

L2 ELL

Visual-Spatial

Visual Learning

Figure 26 Display slides or photos of volcanoes. Ask students to compare these to the illustration and classify each one as to type. Most photos will be of composite volcanoes—Fuji, Kilimanjaro, Mt. St. Helens, etc. Cinder cones will be small and noticeably devoid of vegetation, and Hawaiian volcanoes are all shield volcanoes. **L2**

ELL **AS** Visual-Spatial

Figure 26 Shield volcanoes, like Mauna Loa, have created some of the largest mountains on Earth. Cinder cones, like Sunset Crater, are the smallest. Some of the famous volcanoes are the composites, like Mount Rainier.

Composite Volcanoes When volcanoes occur along convergent plate boundaries, they tend to have magmas that are richer in silica content than those formed at hot spots or divergent boundaries. This is because as subduction takes place, water and sediment are forced down to regions of higher temperature. Partial melting of materials, in which the silica-rich portion of rock and sediment melts first, produces viscous magma. This produces volcanoes formed from alternating explosive events that produce pyroclastic materials, and lava flows. These **composite volcanoes**, composed of alternating layers, are large, often thousands of meters high and tens of kilometers across the base. **Figure 26** shows all three types.

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Use a world map with several major volcanoes plotted on it. Ask the students to identify the type of volcano and type of plate tectonic boundary associated with each point. Be sure to include Hawaii, which has an unusual plate tectonic connection. Also include islands found along the MOR as examples of divergent boundary volcanoes. **L2** **ELL**

Reteach

Volcano Shape Lead a discussion in which students compare how fluid the lava is and the resulting volcano shape. **L1** **ELL**

Assessment

Create Have each student prepare a quiz-show answer for the category Volcanoes. Critique each answer and save the best for a game at the end of the chapter. **L2**

section 4 review

Summary

Origin of Magma

- Magma originates as molten rock material below the surface and erupts at Earth's surface as lava.
- When the density of magma is lower than surrounding solid rock, it is forced toward Earth's surface.

Eruptive Products

- Eruptive products can be solids, liquids, or gases.

Eruptive Styles

- The style of eruption, whether quiet or explosive, is related to its plate tectonic setting.

Types of Volcanoes

- Cinder cones are small, but they erupt violently.
- Shield volcanoes are very large and mostly expel free-flowing lava quietly.
- Composite volcanoes are large and tend to erupt violently.

Self Check

1. **Explain** why most volcanoes are found at plate boundaries.
2. **Compare and contrast** the physical settings for composite volcanoes, cinder cones, and shield volcanoes.
3. **Describe** causes for variation in eruptive style for volcanoes.
4. **Explain** how magma that originates at depth can erupt as lava at the surface.
5. **Describe** how island chains form over a hot spot.
6. **Think Critically** List some possible consequences if volcanic activity on Earth were to slow down or stop.

Applying Math

7. If a cinder cone is 540 m high and has a base diameter of 3 km, what is the volume of the volcanic cone in cubic meters? Use the formula $V_{\text{cone}} = (r^2 h \pi)/3$.
8. The dome in the caldera of the volcano has a height of 12 meters and a diameter of 50 m. What is its volume?

section 4 review

1. Plate boundaries contain numerous faults along which decompression melting occurs. The fractured crust here allows magma to reach the surface easily.
2. All are landforms created by eruption of magma; cinder cones are small and composed mostly of pyroclastics; composite volcanoes are intermediate in size and composed of layers of pyroclastics and lava flows; shield volcanoes are largest and composed mostly of lava flows.
3. Eruptive style is controlled by silica (quartz) content, gas content, and temperature.
4. Molten rock material has a lower density than the solid rock around it so it is forced upwards.
5. The hot spot remains at a fixed location in the mantle while the overlying plate passes over it. Magma erupts through the plate at new locations forming a chain.
6. Slowing of volcanic activity might cause changes in atmospheric composition; volcanic mountains in divergent zones to stop growing; volcanic mountains in convergent zones to stop growing.
7. $1.27 \times 10^9 \text{ m}^3$
8. $7,850 \text{ m}^3$

A Case for Pacific Plate Motion

To measure motion you have to have a starting and an ending point. You must also know the time it took to get from start to end. Volcanic activity associated with a hot spot beneath Hawaii gives geologists exactly that.

Real-World Problem

How can scientists show that Earth's plates are moving?

Goal

- Infer** a rate of movement for the Hawaiian Islands over a hot spot

Materials

ruler calculator
scale map of the Hawaiian Islands

Procedure

- Make a data table like the one shown below.
- Measure and record** the distances between the island sets in the data table. Use the map scale to convert measurements to km.
- Refer to average ages given for each island on the map. Calculate and record the age

Distance/Time Data for Hawaiian Islands

From/To	Distance (km)	Time (years)	Rate (km/year)
Hawaii to Maui	161		
Maui to Molokai			
Molokai to Oahu			
Oahu to Kauai			

differences for each set of islands in the data table. Use the hot spot beneath the island of Hawaii as a starting reference point.

- Calculate** the rate of motion in km/year. Assume that the hot spot is stationary and that the Pacific plate is moving over it.

Conclude and Apply

- Evaluate** how meaningful your calculated rate numbers are. Determine a better rate unit and convert your km/year rates to these new units.
- Infer** why the rates are not consistent using what you know about plate movement.
- Describe** the overall motion of the Pacific Plate based on your data.
- Observe** a map of the Pacific Ocean and infer the location of a divergent zone that could be "pushing" the Pacific plate.

Communicating Your Data

Share your findings with the class and discuss alternative interpretations.

LAB 379

Real-World Problem

Purpose Students will determine if scientists can prove that Earth's plates are moving.

Process Skills measure, infer, record, calculate

Time Required 40 minutes

Procedure

Teaching Strategy Students must measure very carefully between dots on each island.

From/To	Distance (km)	Time (years)	Rate (km/yr)
H-M	161	10^6	1.61×10^{-4}
M-M	80	7.5×10^5	1.06×10^{-4}
M-O	116	3.5×10^5	3.31×10^{-4}
O-K	186	3.2×10^6	5.8×10^{-5}

Conclude and Apply

- The numbers are very small; use cm/yr; 16.1, 10.6, 33.1, 5.8
- Plates move at different rates over time.
- The Pacific plate appears to be moving WNW to NW at an average rate of 10.2 cm/yr.
- East Pacific Rise

Assessment

Process Using a world map showing plate boundaries, have students infer various directions of plate motion and the divergent zones assisting that motion. L2

ELL **Visual-Spatial**

Communicating Your Data

Class discussion Select a plate and identify the ridge push and slab pull regions. Pacific Plate; push—East Pacific Rise, pull—Aleutian, Kuril, Japan Trenches.

 Real-World Problem

How do you determine the location of an earthquake epicenter?

Purpose Demonstrate the method used to locate earthquake epicenters.

Process Skills measure, make and use graphs, record, infer, interpret data

Time Required 70 minutes

 Procedure**Teaching Strategies**

- Do the lab in two stages. Check students' graphs for accuracy before they use them to find an epicenter.
- Caution students that it is the time difference between the curves that is used.
- Graph is non-standard in that time is a y-axis variable.

Table 3 Answers

Time Diff.	Distance to Epicenter	Distance On Map
3m 0 sec	1500 km	7.5 cm
7m 30 sec	2100 km	10.5 cm
2m 30 sec	1200 km	6.0 cm

Goals

- **Examine** a table of seismic wave velocities.
- **Analyze** data from the table.
- **Determine** the location of an epicenter.

Possible Materials

plain white paper
graph paper
compass
metric ruler

Safety Precaution

Earthquake! Earthquake! Where's the earthquake?

Understanding earthquakes begins with locating them. To determine the epicenter of an earthquake, scientists use a method called triangulation. If you know the locations of three points on a map, you can determine a fourth point **Diagram 1** shows how triangulation works.

 Real-World Problem

You are on vacation in City A and experience an earthquake. The radio stations are broadcasting information about the earthquake. Your home is in City B. Is your home near the epicenter?

 Procedure

1. Draw a 20-cm $\times$ 15-cm rectangle on a piece of plain white paper. Orient the rectangle so that the 20-cm edge is vertical. This rectangle will serve as your map.
2. Using a scale of 1 cm = 200 km, draw a distance scale just below the rectangle on the white paper. Place an arrow parallel to one of the 20-cm vertical edges and label it *North*.
3. Within the rectangle, place City A 400 km from the north edge and 400 km from the west edge. Locate City B 800 km from the north edge and 800 km from the east edge; and City C 1,200 km from the south edge and 1,200 km from the west edge of the rectangle. Your map will look similar to **Diagram 2**.
4. The earthquake happened at 08:37:00 PST. Copy and complete **Table A** on your own paper. Subtract the P-wave and S-wave arrival times to find the time differences for cities B and C. Use the travel time graph and the time differences to complete the last two columns.

Table A Earthquake Arrival Time Data for Cities A, B, and C

City	P-wave Arrival	S-wave Arrival	Time Difference (min/sec)	Distance to Epicenter	Distance on Map
A	08:40:00	08:43:00	3 min/0 sec		
B	08:41:15	08:45:00			
C	08:39:40	08:42:10			

Using Scientific Methods

5. **Estimate** the distance from each city from Table B below.
6. Use the Distance on Map measurement for City A to set the compass width, and then draw the distance circle around City A on your map. Your circle may go off the map, but don't worry. The epicenter is somewhere on the arc you can draw on the map. Repeat this process for City B and City C.

Table B Seismic Wave Arrival Times

Point	Time difference between P-waves and S-waves (min)	Distance (km) traveled by waves
M	1.3	500
O	2.2	1,000
P	3.6	2,000
Q	4.5	3,000
R	5.4	4,000

Diagram 1

Diagram 2

Analyze Your Data

1. **Estimate** the time difference for P-waves and S-waves coming from 2,500 km.
2. **Estimate** the distance for a P-wave and S-wave pair that measure a time difference of 3.3 minutes.
3. **Determine** how much closer to the epicenter City A is than City B. City A received waves 3.0 minutes apart. City B received waves 4.2 minutes apart.

Conclude and Apply

1. **Explain** the relationship between body wave travel time differences and the distance to an earthquake epicenter.
2. **Evaluate** the potential danger to your home City B. How far is your city from the epicenter?
3. **Infer** the arrival time difference for S-waves and P-waves at or very close to the epicenter.
4. **List** the possible sources of error in the methods you used to determine an epicenter. How can you minimize errors?

Communicating Your Data

Describe the location of the epicenter in terms of distances from a reference point on your map. **Compare** your descriptions with others.

Analyze Your Data

Expected Outcome Slight variations in answers are expected due to plotting and estimation. Students should be able to explain that as seismic waves travel farther, the difference in arrival times between them increases.

Answers to Questions

1. 4.5 sec
2. 8.3 sec
3. 3,450-3,500 km

Error Analysis

Ask students to identify the sources of any errors in this procedure.

Conclude and Apply

1. distance to epicenter increases as time difference increases
2. 2,100 km; Because it is farther away, damage should be less than other cities. Damage is dependent on magnitude, which is not established by the graph.
3. arrival time difference should be near zero. There should be a slight difference due to the depth of the focus. If the epicenter and focus are at the surface, the answer is zero.
4. plotting, measuring, calculation; responses will vary.

LAB 381

Communicating Your Data

Have students use their data to deliver a newscast which informs the public of what effects the earthquake had.

Assessment

Process Show students seismic wave graphs with less slope or greater slope—flatter or more upright and ask what this implies about the seismic waves. flatter = faster; upright = slower L2 ELL LS
Visual-Spatial

Content Background

Current theories are that the cooling effect of volcanoes is mostly due to aerosols—very small droplets—of sulfuric acid in the stratosphere. Stratospheric effects only occur during very large volcanic eruptions. Because it is so high in the atmosphere, the material is not quickly removed by rain. By reflecting and absorbing sunlight, these aerosols significantly reduce surface temperatures. A drop of several degrees has a major effect on growing season and crop productivity. In addition to less light and lower temperatures, the cooling causes more clouds and rainfall. Even a small change in average temperature can have a major effect on wind patterns.

Not all of the effects of volcanic eruptions are negative. In addition to ash and sulfuric acid, volcanoes bring up air and water from deep inside Earth. Much of the cloud above a volcano consists of steam. Some theories attribute the water of the oceans to ancient volcanic activity.

Historical Significance

Strothers' research demonstrates the value of historic records to current scientific research. In a paper published in 1999, he reported that the seven largest volcanoes of the last 2000 years were all followed by plague epidemics. This is a strong enough correlation to suggest a connection. Shortages of food and cold, wet weather tend to weaken disease resistance within a population. The cool and moist conditions are also favorable for the microorganisms that cause plague.

Volcano Weather

In 1815, people worldwide noticed unusually brightly colored sunsets. Then in 1816, the weather in many parts of the world was colder than normal. In North America and Europe, 1816 was known as “the year without a summer.” Parts of New England had damaging frosts in July and August. The fantastic sunsets and the cold summer resulted from the massive eruption of Tambora, a volcano in Indonesia.

Giant Weather Makers

Communication was slow in the early nineteenth century, so scientists immediately did not connect Tambora's eruption to weather change. Today, many researchers study the effects of volcanic eruptions on weather. When Mount Pinatubo in the Philippines erupted in June 1991, weather stations around the world—and even in space—recorded its effects.

Mt. Pinatubo's eruption was smaller than Tambora's but was the second largest eruption in over 100 years. It blew ash and gases into the stratosphere, where they were carried by wind around the world. Because the suspended particles and droplets absorbed and reflected sunlight, average temperatures temporarily dropped by about 0.5°C in many places. Other weather-related affects included the increased strength of hurri-

cans in the Atlantic and Pacific Oceans and as well as flooding rains in the U.S. Midwest.

Looking Back at Volcanoes

The effect of volcanoes on climate is so important that some scientists even study volcanic eruptions from thousands of years ago. They compare the dates of these ancient eruptions with records of unusual weather. It has been found that crop failures and disease epidemics often occurred soon after large eruptions. Because changes in weather can affect the growth of trees, the growth rings of ancient trees also are evidence that support the data from written records. These ancient records help scientist predict the weather impacts of future volcanic eruptions.

Experiment Lay two sheets of black construction paper on a sunny windowsill and place a thermometer on each sheet. Tape a large piece of gauze or cheesecloth to the window so that it shades one of the sheets. Record the change in temperature for one half hour.

TIME

For more information, visit
fl.gpscience.com

Experiment Students should observe a significant temperature difference between the two sheets of paper. Be sure that conditions other than shading by the screening material are identical. If a sunny windowsill is not available, an incandescent lamp can be used.

Krakatoa, The Day the World Exploded by Simon Winchester, HarperCollins, 2003

Volcanoe Weather: The Story of The Year Without a Summer 1816, by Henry Stommel & Elizabeth Stommel, Seven Seas Press 1983

Reviewing Main Ideas

Section 1 Evolution of Earth's Crust

1. Earth's crust and uppermost mantle, together called the lithosphere, consist of about seven large and numerous smaller plates.
2. Plate motion over the asthenosphere is influenced by forces that include ridge push, frictional drag, and slab pull.
3. Mantle convection drives the system of plates. Thermal energy sources for convection include heat left over from Earth's formation, and decay of radioactive isotopes.
4. Plates meet along divergent, convergent, and transform boundaries.

Section 2 Earthquakes

1. Earthquakes are vibrations in Earth caused by the sudden release of energy.
2. During an earthquake caused by movement along a fault, strain energy is released in the form of seismic waves.
3. Most earthquake activity is confined to regions near plate boundaries.
4. Short-term prediction of earthquakes is not yet possible, but earthquakes can be rated by their intensities and magnitudes.

Section 3 Earth's Interior

1. The interior of Earth consists of four main layers: crust, mantle, inner and outer core.
2. The crust and mantle are largely composed of solid silicates. The asthenosphere is a layer of mantle in a semi-solid state.
3. The two innermost layers, the inner and outer core, are mainly composed of iron, nickel, oxygen and sulfur. The outer core is in a liquid state, and the inner core is solid.
4. The crust is the thinnest layer, while the mantle is the thickest.

Section 4 Volcanoes

1. Most volcanic activity on Earth occurs in the vicinity of plate boundaries or above mantle plumes.
2. The viscosity of the magma feeding volcanoes controls the volcanoes' eruptive characteristics.
3. Major controls on magma viscosity are: temperature, chemical composition, and gas content.
4. Cinder cones, shield volcanoes, and composite volcanoes are three principle volcanic landforms.

FOLDABLES Use the Foldable that you made at the beginning of this chapter to help you review Earth's internal process.

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment

Assessment Transparency Earth's Internal Processes Chapter 12

Earthquakes, volcanoes, and most tectonic activities occur at the point where two plates meet or move against each other. At convergent boundaries, plates move towards each other and collide. At divergent boundaries, plates move away from each other and the space is filled by molten rock rising and cooling to add new material and area to the plates. But with transform-fault boundaries, plates move horizontally past each other. Where these transform-fault lines are located, the regions are geologically very active. The most volcanically and seismically active region on Earth is known as the 'Ring of Fire.' Three-fourths of Earth's active and dormant volcanoes lie along this arc, at the margins of the large Pacific Plate.

1. What happens at convergent boundaries such as the Nazca Plate and the South American Plate? What surface features exist along these boundaries?
2. Identify a large divergent boundary. What does this mean for the continents resting on these two plates?
3. Why are volcanoes located most often along transform-fault boundaries?
4. What is the correlation between volcanoes and earthquake events? Can one occur without the other?

L2

FOLDABLES Have students use their Foldables to review divergent, convergent, and transform plate boundaries.

Using Vocabulary

1. focus
2. fault
3. rift valley
4. cinder cone
5. discontinuity

★ FCAT Vocabulary

Complete each sentence with the correct vocabulary word or words.

1. The _____ is the point of origin of an earthquake.
2. A zone of cracking in Earth's crust along which movement takes place is a _____.
3. A long, linear feature within a divergent plate boundary is a(n) _____.
4. A feature consisting of a relatively small pile of pyroclastic materials is a(n) _____.
5. A boundary marking an abrupt change in density is a(n) _____.

Checking Concepts

Choose the word or phrase that best answers the question.

6. What process causes a material to break due to excess stress?
 - A) plastic deformation.
 - B) elastic rebound.
 - C) elastic deformation.
 - D) brittle deformation.
7. Which best identifies a shield volcano?
 - A) sticky, silica-rich magmas
 - B) great height compared to width
 - C) forms above hot spots
 - D) found mostly on continents

8. What characteristic was first used to identify Earth's layers?
 - A) temperature.
 - B) composition.
 - C) density.
 - D) thickness.
9. Which pair of plate tectonic boundaries is best characterized by mostly shallow-focus earthquakes?
 - A) divergent and transform
 - B) divergent and continent-ocean convergent
 - C) continent-continent and continent-ocean convergent
 - D) transform and ocean-ocean convergent zones
10. Which feature is common to and only found in diverging regions?
 - A) trenches
 - B) rift valleys
 - C) volcanic arcs
 - D) island arcs
11. Which is NOT evidence used by Wegener to support the continental drift hypothesis?
 - A) matching magnetic patterns symmetrical to the Mid-Ocean Ridge
 - B) matching of continental margins
 - C) correlation of fossils among the continents
 - D) mountain-range matching among the continents

Use the illustration below to answer question 12.

12. Which volcano type has small height, small diameter and consists mostly of pyroclasts?
 - A) Hawaiian volcano
 - B) cinder cone volcano
 - C) composite volcano
 - D) shield volcano

Use the ExamView® Pro Test Bank CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

13. Which earthquake waves travel through matter with a push-pull motion?

A) secondary waves
B) surface waves
C) primary waves
D) body waves

Interpreting Graphics

14. Copy and complete the concept map below summarizing characteristics of divergent, convergent and transform plate boundaries.

15. Copy and complete the table summarizing three types of volcanoes.

Magma Properties and Volcano Types

General Composition	Relative silica (SiO ₂) Content	Relative Viscosity	Volcano Type
Basaltic	lowest	lowest	shield
Andesitic	intermediate	intermediate	composite
Rhyolitic	highest	highest	Lava Dome

Thinking Critically

16. **Explain** why the island of Kauai, often referred to as the "Garden Isle," has thicker soils and is better able to sustain agriculture than other Hawaiian Islands.
17. **Infer** what general depth of focus earthquakes are likely to occur in the Himalaya.
18. **Explain** how the processes associated with plate tectonics maintain Earth's recycling of materials.

Applying Math

19. **Calculating Lava Thickness** Suppose that hot spot volcanism produces an average of 76,000 m³ of lava per day and does so for 340 days. This lava flows across a region that has an area of 10 km². How thick will the resulting lava flow be?
20. Located on the island of Hawaii, Mauna Loa is the largest volcano on Earth and rises 17 km above its base. Using the thickness you found in question 19 as the annual thickness, how many years did it take for Mauna Loa to build from the sea bed?
21. Mauna Loa rises 4 km above sea level. How many years did it take to grow from sea level to its present height?
22. An active volcano called Loihi lies just off the coast of the island of Hawaii. It is called a seamount because it still lies below the surface. If it grows at the same rate you used in question 21 and lies 1250 m below the surface, how long will it take for Loihi to break the ocean surface?

Interpreting Graphics

14. See student page.
15. See student page.

Thinking Critically

16. It is older and has had a longer time for rock to weather and produce a soil.
17. Himalayas are in a continent-continent convergence zone, which results in deep focus earthquakes.
18. At convergent boundaries sediment and rock is subducted, metamorphosed and eventually melted. The resulting magma returns to the surface during volcanic eruptions to be weathered to sediments again.

Answer Sheet An answer sheet can be found at fl.gpescience.com.

Standardized Test Practice Answer Sheet

Multiple Choice

1. ☐ A ☐ B ☐ C ☐ D

2. ☐ A ☐ B ☐ C ☐ D

3. ☐ A ☐ B ☐ C ☐ D

Gridded Response

1	2	3	4	5
6	7	8	9	0
+	-	x	/	=

Go On

Multiple Choice

1. C
2. B
3. A
4. C
5. C

Gridded Response

6. 5.75 meters
7. 6 times farther (34.5 m/5.75 m)

Short Response

8. The magnetic polarity of Earth has reversed many times during geologic history. This reversal is reflected in symmetrical bands of igneous rocks that are located on either side of the MOR. This indicates that the new ocean floor moves horizontally away from the MOR and in opposite directions.
9. Tectonic plates can converge, diverge, or move past each other.
10. When two continental plates converge, they build up mountain ranges as Earth's crust is compressed and folded. When two oceanic plates converge, the denser one subducts under the less dense one. When an oceanic plate con-

verges with a continental plate, the denser oceanic plate subducts under the less dense continental plate.

11. He was using sonar to search for and detect submarines. While doing this, he also determined the distance from the ocean surface to the ocean floor, enabling him to

map the ocean floor.

12. Upwelling magma causes cracks to form in the overlying crust. As the cracks develop, movement of the magma causes crust on either side of the cracks to move away from each other. Faulting then causes a down-dropped valley between two

parallel mountain ranges.

13. Sediments are thinner near the mid-ocean ridge and thicker as you approach the continents. Also, sediments near the MOR are recent in age, whereas sediments near the continents are recent on top, but older near the bottom. This

Record your answers on the answer sheet provided by your teacher or on a sheet of paper. The assessed Florida Benchmark appears above the question.

Multiple Choice

1. Who first proposed the hypothesis of continental drift?
 - A. Matthews
 - B. Vine
 - C. Wegener
 - D. Wilson

Use the image below to answer question 2.

2. Which is the fern, pictured above, that provided support for Pangaea?
 - A. Antarctica
 - B. Glossopteris
 - C. Mesosaurus
 - D. Lystrosaurus

Test-Taking Tip

For each question, double-check that you are filling in the correct answer bubble for the question number you are completing.

3. What did oceanographers show, using sonar, which helped revive continental drift?
 - A. edges of the continental shelves matched
 - B. edges of the continents matched
 - C. fossils match similar fossils
 - D. rocks match similar rocks

SC.8.1.12

4. Which forms when a less-dense plate converges on a denser plate?
 - A. mid-ocean ridge
 - B. rift valley
 - C. subduction zone
 - D. transform boundary

Use the image below to answer question 5.

5. The shadow zone, illustrated above, is caused by which layer of Earth?
 - A. crust
 - B. mantle
 - C. outer core
 - D. inner core

Gridded Response

SC.D.1.4.4

6. If a divergent boundary separates at a rate of 2.5 cm/year, how much farther apart would the two plates be after 230 years?
7. Compared to the two plates in question 7, how much farther apart would two plates be after 230 years if the divergent boundary between them separated at 15 cm/year?

Short Response

Use the illustration below to answer question 8.

SC.H.1.4.2

8. The illustration shows reverse polarity bands on the seafloor. How does magnetic polarity of rocks support seafloor spreading?

SC.D.1.4.2

9. What are the three different ways in which tectonic plates can move?

SC.H.1.4.2

10. What is different about what happens to plate edges at the different types of convergent boundaries?
11. How did Dr. Harry Hess obtain detailed maps of the ocean floor?

SC.D.1.4.2

12. What causes a rift valley to form at divergent boundaries?

SC.H.1.4.2

13. What is true about the thickness and age of sediments at different locations on the ocean floor that supports seafloor spreading?
14. What is the driving force for all mechanisms of tectonic plate movement?
15. What is the difference between a crack in Earth's crust and a fault?
16. What causes the energy of an earthquake?
17. How are the focus and epicenter of an earthquake related?

Extended Response

Use the image below to answer question 18.

18. **Part A** What is true about the depth of earthquake foci and the location of tectonic plate boundaries?
Part B Why are deep-focus earthquakes noted only at ocean-ocean convergent boundaries and ocean-continental convergent boundaries?

Short Response

indicates that sediments on the ocean floor near the MOR are too recent to have accumulated into thick deposits such as are found nearer the continents.

14. Internal convection of mantle material inside Earth.
15. A fault is a crack in Earth's crust along which there has been movement.
16. Elastic rebound, the sudden energy release that occurs when brittle rocks move along a fault, provides the energy to cause vibrations (earthquakes) in the rock layers.
17. The point inside Earth where energy is released to cause an earthquake is the focus, the point on Earth's surface directly above the focus is the epicenter of the earthquake.

18. **Part A** Shallow focus earthquakes occur along divergent and transform boundaries. Both shallow and deep focus earthquakes occur at convergent boundaries.
Part B Deep focus earthquakes occur at ocean-continent and ocean-ocean convergent boundaries where subduction forces one plate down and under a less dense plate. As the one plate subducts under the other, earthquakes are generated near Earth's surface and deep inside Earth along the subducting plate.

WebQuest *Maglev Trains: Floating Locomotives*

is an investigation of magnets and how they work. Using online resources, students study different types of magnetic levitation, design and build a maglev train, then test and refine their models. Class presentations reflect student designs, procedures, refinements, and results.

How Are Clouds & Toasters Connected?

**PROJECT****CRISS****Study Skills**

Discussion Provide students with sticky notes. Have students read through one or more chapters in the unit, either at home or as an in-class assignment. As they read, they should use the sticky notes to mark topics or examples they find especially interesting or difficult. They may use the notes for short descriptions or questions they may have, or to mark uses for electricity, magnetism, or nuclear energy that they find interesting.

unit projects

In the late 1800s, a mysterious form of radiation called X rays was discovered. One French physicist wondered whether uranium would give off X rays after being exposed to sunlight. He figured that if X rays were emitted, they would make a bright spot on a wrapped photographic plate. But the weather turned cloudy, so the physicist placed the uranium and the photographic plate together in a drawer. Later, on a hunch, he developed the plate and found that the uranium had made a bright spot anyway. The uranium was giving off some kind of radiation even without being exposed to sunlight! Scientists soon determined that the atoms of uranium are radioactive—that is, they give off particles and energy from their nuclei. In today's nuclear power plants, this energy is harnessed and converted into electricity. This electricity provides some of the power that is used to operate everything from lamps to toasters.

unit projects

Visit unit projects at fl.gpscience.com to find project ideas and resources. Projects include:

- **History** Research ten historical weather-related events and how the use of technology has improved the quality of life.
- **Technology** Design a safe, efficient, and economical cooking device. Draw blueprints, apply for a patent, and test your appliance. Submit your recipe, appliance, and food to the class.
- **Model** Construct a unit review game that demonstrates electricity or magnetism. Review information with the answer key should be provided in a well-designed, marketable package.

Using *Maglev Trains* WebQuest, research, design, build, and test your own version of a maglev train, then present your model to the class.

History Have students research ten historical weather-related events. Students prepare a brief summary of these events, how they relate to geographical features, and how technology and weather forecasting have improved everyday lives.

Technology Ask students to design a safe, efficient, and economical cooking device that uses energy other than fossil fuels. Have students draw blueprints, apply to the teacher for a “patent” on their original device, test their appliance with a recipe, and then submit the recipe, appliance, and cooked food for teacher and peer evaluation.

Model Have students design and construct a unit review game or toy that demonstrates electricity or magnetism as one of its characteristics. The completed model should contain directions for use, an ample amount of unit review information with answer guide, and be contained in a well-designed box, ready for the game-store market. Display each creative, quality product for class review, as well as evaluation by peers and teachers for educational review value, electric and magnetic modeling, construction quality, safety, and enjoyment.

Additional Resources Visit unit projects at fl.gpscience.com for more information, resources, and assessment rubrics.

**NATIONAL
GEOGRAPHIC**
How Are Clouds & Toasters Connected?

- Ask students to list the connections between clouds and toasters. You might want them to use a concept map to relate one step to another.
- Students might start this activity with negative ideas about nuclear energy. Have them make a two-column table they can use to

list the positive and negative aspects of nuclear energy as they learn more about it.

- Ask students to brainstorm what geographic areas might most likely use nuclear power to produce electricity and why. *Most nuclear power plants are in regions of the country with the highest populations, where there is the greatest need.*

Section Focus

Section Focus Transparency **Chapter 13**

Stick to Your Laundry Duty

What happens when you put clothes in a dryer? As the clothes tumble, they rub against other articles of clothing and the walls of the dryer. As you can see, items of clothing can build up a static charge.

1. If you line-dry clothes, will they have static cling? Why or why not?

2. As you separate clothes that are clinging together, what might you see and hear? Is this similar to anything else that you can think of?

L2

Section Focus Transparency **Chapter 13**

Go with the Flow

The force of gravity causes water to flow down. The water takes the path of least resistance. It flows where it can most easily go. Electric currents flow and experience resistance.

1. Which do you think has more energy, the waterfall in the picture or Niagara Falls which are higher and have more water flowing over? Explain your answer.

How do you think the electric flow is similar?

L2

Section Focus Transparency **Chapter 13**

One Big Electric Bill

How many ways can the use of electricity power? Look at the image below of lights at night. You can pick out areas such as Europe and the east and west coasts of the United States because of all the electric lights.

1. If electric lights are an accurate gauge of electricity usage, what areas use the most electricity?

What areas use the least electricity?

Do you see any areas that use electricity? What would you guess is it?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Assessment Transparency **Chapter 13**

Electricity

Directions: Refer to the graph and answer the following questions.

Life of Batteries

As he tested four different brands of batteries, He found that the first kind lasted 10 hours, the second kind lasted 20 hours, the third kind lasted 5 hours, and the fourth kind lasted 25 hours. Which represents the second kind?

A. Q
B. R
C. S
D. T

2. According to the graph, which battery lasted the LEAST amount of time?

A. Q
B. R
C. S
D. T

3. About how much longer did battery T last than battery Q?

A. 2 hours
B. 7 hours
C. 10 hours
D. 15 hours

Science Content Background

Electric Charge

Positive and Negative Charge

Waterfalls produce airborne negative charges. Some people believe these charges make us feel happy and healthy. Ion machines were created to produce negative charges in houses and offices.

Transferring Charge

Benjamin Franklin invented the lightning rod to protect homes by transferring charge. It was a metal rod that was grounded through a wire. The top of the rod was sharpened to a point. Recently scientists discovered that the rods actually work better if they are not sharpened at the top.

Electric Current

Current and Voltage Difference

Electric current flows from a region of high electric potential energy to low electric potential energy. Electric charge loses electric potential energy as it flows through a circuit just as a ball loses gravitational potential energy when it falls. The electric potential energy lost by a coulomb of charge from one point to another is the voltage difference between the two points. This energy can be used to do useful tasks, such as run electric

motors. A battery increases the electrical potential energy of charges, just as lifting a ball increases the ball's gravitational potential energy. All circuits contain electric resistance that converts some electric potential energy to thermal energy as charges move through the circuit.

Electric current has the unit of the ampere, which is defined as one coulomb per second. One coulomb is equivalent to the charge of 6.25×10^{18} electrons.

Electrical Energy

Series and Parellel Circuits

We pay the electric company for our use of electrical energy. The electrons that transfer electrical energy are not used up in the process; they keep flowing.

In a series circuit with three different resistors, the current at all points in the circuit is the same but the voltage difference across each resistor is different. In a parallel circuit with three different resistors, the voltage difference across the resistors is the same but the current is different.

Electric Power

Electric power is found by multiplying current (coulombs/second) times voltage (joules/coulomb), giving units of joules/second, which is equivalent to a watt.

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that . . .

Voltage is the same at different places in a circuit and it exists only when current flows.

Because electrons and the flow of charge that make up electricity cannot be seen directly, electricity can be difficult to understand and terms such as voltage, current, power, and energy can be confusing. Of all these terms, voltage is the most abstract and can be the most difficult to grasp. Because of the omnipresence of batteries, students are probably familiar with the volt as a unit of measure. This may conceal their misconceptions about voltage. They may confuse the relationship between voltage and current and may come to the wrong conclusion that voltage is a consequence of current and not the cause of it. They also may have inaccurate conceptions of how voltages in a circuit vary.

Activity

Draw the circuit shown in the figure below on the board, and ask students to predict and write what the voltages will be between the points A–B, B–C, C–D, B–D, and A–E.

Promote Understanding

Activity

Give each group of students four wires, two flash-light bulbs in sockets, a D battery in a battery holder, and a voltmeter. Ask students to make a series circuit using the battery, bulbs, and four wires. Caution students not to touch a hot bulb.

- Instruct them in the use of the voltmeter. Then have them refer to the figure above and record the voltages between points A–B, A–E, B–C, B–D, and C–D.
- The experimental results should show a voltage of approximately 1.5 volts across points A–E, and B–D, an approximate voltage of 0.75 volts across B–C and C–D, and zero across A–B.

- Have them compare their experimental results with the predictions they made in the previous activity.
- Remove the lightbulb at points B–C from the circuit to leave a gap in the circuit.
- Ask students what they think the voltage across points B–C will now be. Have them share their thoughts and then test their ideas.
- The voltage across the gap should be approximately 1.5 volts.

Assess

After completing the chapter, see *Identifying Misconceptions* in the Study Guide at the end of the chapter.

Shine on Brightly

Electricity lights these city lights so that people can continue to work and have fun, day or night. Electric lights and other electric devices operate by converting electrical energy into other forms of energy.

Science Journal For five electric devices, list the form of energy that electrical energy is converted into by each device.

Theme Connection

Energy This chapter explores the fundamental nature of electrical energy—how it is produced, measured, transmitted, and transformed into other forms of energy.

About the Photo

Keeping the Lights On Cities are connected to large power distribution grids, or networks. Energy is transmitted through big power lines from generating plants, which are often hundreds of miles away. In the city the power lines usually run through underground tunnels to each of the buildings. Regional control centers use computers to regulate the flow of energy within and between power grids.

Start-Up Activities

Electric Circuits

No lights! No CD players! No computers, video games or TVs! Without electricity, many of the things that make your life enjoyable wouldn't exist. For these devices to operate, electric current must flow in the electric circuits that are part of the device. Under what conditions does electric current flow in an electric circuit?

1. Obtain a battery, a flashlight bulb, and some wire.
2. Connect the materials so that the lightbulb lights.
3. Draw diagrams of all the ways that you were able to light the bulb.
4. Record a few of the ways that didn't work.
5. Can you light the bulb using only one wire and the battery?
6. **Think Critically** Write a paragraph describing the requirements to light the bulb. Write out a procedure for lighting the bulb and have a classmate follow your procedure.

FOLDABLESSM Study Organizer

Electricity Make the following Foldable to help you organize information about electricity.

- STEP 1** Fold a sheet of paper vertically from top to bottom. Make the top edge about 2 cm shorter than the bottom edge.

- STEP 2** Turn lengthwise and fold into thirds.

- STEP 3** Unfold and cut only the top layer along both folds to make three tabs.

- STEP 4** Label the Foldable as shown.

Organize Information As you read the chapter, organize the information you find about electric charge, electric current, and electrical energy under the appropriate tab.

Science online

Preview this chapter's content and activities at jglscience.com

Purpose Students explore how electric light circuits work.

L2 ELL IS Kinesthetic

Preparation Strip insulation off the ends of the wires.

Materials battery, flashlight bulb, insulated wire, electrical tape or battery holder

Teaching Strategy If battery holders are used, demonstrate how to attach the wires to the clips. If not, show students how to tape the stripped ends of the wires to the battery.

Think Critically

In order to light the bulb, a continuous path must be made from the battery, through a wire, to the bottom of the bulb. The path must then lead from the side of the bulb, through another wire, and back to the battery.

Assessment

Process Have students make a list of configurations that did NOT light the bulb. Have them infer what was wrong in each. Use **Performance Assessment** in the Science Classroom, p. 89.

L2 ELL

Section Focus Transparency **Stick to Your Laundry Duty** Chapter 13

What happens when you put clothes in a dryer? As the clothes tumble, they rub against other articles of clothing and the walls of the dryer. As you can see below, the result could be a bit of static cling.

1. If you line dry clothes, will they have static cling? Why or why not?
2. As you separate clothes that are clinging together, what might you see and hear? Is this similar to anything else that you can think of?

L2

Reading Preview

Tie to Prior Knowledge

Static Cling Ask students whether they have ever noticed clothes sticking together when they are taken out of the dryer. Explain that this is caused by static electricity, the topic of this section.

Predict Ask students what they think *charging by contact* and *charging by induction* might mean in a study of electricity. Some will surmise that contact means touching and induction means not touching. Have students preview the text to see if their predictions are correct.

Reading Guide

What You'll Learn

- **Describe** how electric charges exert forces on each other.
- **Compare** the strengths of electric and gravitational forces.
- **Distinguish** between conductors and insulators
- **Explain** how objects become electrically charged.

Why It's Important

The electrical energy that all electrical devices use comes from the forces that electric charges exert on each other.

Review Vocabulary

atom: the smallest particle of an element

New Vocabulary

- static electricity
- law of conservation of charge
- conductor
- insulator
- charging by contact
- charging by induction

Positive and Negative Charge

Why does walking across a carpeted floor and then touching something sometimes result in a shock? The answer has to do with electric charge. Atoms contain particles called protons, neutrons, and electrons, as shown in **Figure 1**. Protons and electrons have electric charge, and neutrons have no electric charge.

There are two types of electric charge. Protons have positive electric charge and electrons have negative electric charge. The amount of positive charge on a proton equals the amount of negative charge on an electron. If an atom contains equal numbers of protons and electrons, the positive and negative charges cancel out and the atom has no net electric charge. Objects with no net charge are said to be electrically neutral.

Figure 1 The center of an atom contains protons (orange) and neutrons (blue). Electrons (red) swarm around the atom's center.

Transferring Charge Electrons are bound more tightly to some atoms and molecules. For example, compared to the electrons in atoms in the carpet, electrons are bound more tightly to the atoms in the soles of your shoes. **Figure 2** shows that when you walk on carpet, electrons are transferred from the carpet to the soles of your shoes. The soles of your shoes have an excess of electrons and become negatively charged. The carpet has lost electrons and has an excess of positive charge. The carpet has become positively charged. The accumulation of excess electric charge on an object is called **static electricity**.

Section 1 Resource Manager

Chapter FAST FILE Resources

Transparency Activity, p.42
Note-taking Worksheets, pp. 31–33
Directed Reading for Content Mastery, pp. 17–18

Enrichment, p. 28
MiniLAB, p. 3
Reinforcement, p. 25

Before the shoe scuffs against the carpet, both the sole of the shoe and the carpet are electrically neutral.

As the shoe scuffs against the carpet, electrons are transferred from the carpet to the sole of the shoe.

Conservation of Charge When an object becomes charged, charge is neither created nor destroyed. Usually it is electrons that have moved from one object to another. According to the **law of conservation of charge**, charge can be transferred from object to object, but it cannot be created or destroyed. Whenever an object becomes charged, electric charges have moved from one place to another.

✓ Reading Check How does an object become charged?

Charges Exert Forces Have you noticed how clothes sometimes cling together when removed from the dryer? These clothes cling together because of the forces electric charges exert on each other. **Figure 3** shows that unlike charges attract each other and like charges repel each other. The force between electric charges also depends on the distance between charges. The force decreases as the charges get farther apart.

Just as for two electric charges, the force between any two objects that are electrically charged decreases as the objects get farther apart. This force also depends on the amount of charge on each object. As the amount of charge on either object increases, the electrical force also increases.

As clothes tumble in a dryer, the atoms in some clothes gain electrons and become negatively charged. Meanwhile the atoms in other clothes lose electrons and become positively charged. Clothes that are oppositely charged attract each other and stick together.

Figure 2 Atoms in the shoe's sole hold their electrons more tightly than atoms in the carpet hold their electrons.

Explain how the sole gained charge even though charge can't be created or destroyed.

Figure 3 Positive and negative charges exert forces on each other.

2 Teach

Activity

Changes Have students use balloons, glass rods, polystyrene, puffed cereal, and pieces of silk and wool cloth to explore the ideas of positive and negative charge and the law of conservation of charge. **L2 ELL**

IS Kinesthetic

Caption Answer

Figure 2 Charge was transferred from the carpet to the shoe.

Use an Analogy

Swarming Bees Reinforce the idea that electrons, not atoms, move to cause static electricity by describing an atom as being like a swarm of bees (the electrons) around honey (the tightly held protons and neutrons). **L1**

IS Visual-Spatial

✓ Reading Check

Answer Electrons move from one object to another. The object that gains electrons becomes negatively charged. The one that loses electrons becomes positively charged.

Reading Strategy

Double-Entry Notes Ask students to divide their papers into two columns and label the left column *Main Ideas* and the right column *Important Details*. Have them use topic headings and bold print words as entries on the left side. In the right column, have students add important details related to the main ideas.

Science Journal

Flyaway Hair Have students write a paragraph in their journals in which they use conservation of charge to explain why hair combed on a dry day may become "flyaway hair." *Before combing, both the comb and hair have equal numbers of positive and negative charges. Combing causes hair to lose electrons to the comb. The hairs then have like charges on them and repel one another. This makes them "fly away."* **L2 IS Linguistic, Logical-Mathematical, Intrapersonal**

Discussion

Conductivity Explain that, when substances are categorized as conductors, semiconductors, and insulators, they are being ranked according to the ease with which electrons move around in them (their conductivity). Then have students explain, in terms of electrons, the two extreme limits of conductivity; that is, what would zero conductivity mean and what would the maximum possible conductivity mean? **Zero conductivity means that no electrons can move. Maximum conductivity means that electrons move freely; there is no resistance to electron movement.** [L2] [IS] **Logical-Mathematical**

Use Science Words

Word Meaning Students may have heard the word *semiconductor*. A semiconductor is a material, such as silicon or germanium, that is neither a good insulator nor a good conductor on its own, but becomes a good conductor when a tiny impurity is added to it. Have students find what semiconductors are used for. **Semiconductors are used in computer chips and to make electronic components such as transistors and diodes.** [L3] [IS] **Linguistic**

✓ Reading Check

Answer The electric force between protons and electrons is greater than the gravitational force between the particles.

Quick Demo

Static Shock

Materials pieces of wool carpeting, metal objects (doorknob, ring stand, etc.)

Estimated Time 5 minutes

Procedure Scuff your feet across the carpet several times and then touch the metal object, producing a spark as in **Figure 5**. Darkening the room may make the spark visible; works best on a dry day. Invite the students to try the demo.

Figure 4 Surrounding every electric charge is an electric field that exerts forces on other electric charges. The arrows point in the direction a positive charge would move.

An electric field surrounds every electric charge, as shown in **Figure 4**, and exerts the force that causes other electric charges to be attracted or repelled. Any charge that is placed in an electric field will be pushed or pulled by the field. Electric fields are represented by arrows that show how the electric field would make a positive charge move.

The Strength of Electric Forces The force of gravity between you and Earth seems to be strong. Yet, compared with electric forces, the force of gravity is much weaker. For example, the attractive electric force between a proton and an electron in a hydrogen atom is about a thousand trillion trillion trillion times larger, or 10^{39} times larger, than the attractive gravitational force between the two particles.

In fact, all atoms are held together by electric forces between protons and electrons that are tremendously larger than the gravitational forces between the same particles. The chemical bonds that form between atoms in molecules also are due to the electric forces between the atoms. These electric forces are much larger than the gravitational forces between the atoms.

✓ **Reading Check** Compare the strength of electric and gravitational forces between protons and electrons.

Some Observable Forces are due to Electric Forces

Many of the forces that act on objects are due to the electric forces between atoms and molecules. All atoms contain electrically charged electrons and protons. When atoms or molecules get close enough, they can exert electric forces on each other that can be attractive or repulsive. For example, when you push on a door, the atoms on the surface of your hand get close to the atoms on the surface of the door. These atoms are close enough that they exert electric forces on each other. The electric forces the atoms in your hand exert on the atoms in the door cause the door to move. The frictional force between two surfaces in contact is due to the attractive electric forces between the atoms on the two surfaces. These forces cause the surfaces to stick together.

394 CHAPTER 13 Electricity

Curriculum Connection

Ancient Greeks and Electricity Have students research what ancient Greeks knew about electricity. **Ancient people knew that if amber was rubbed, it would become charged. Elektron is Greek for "amber."** [L2]

[IS] **Linguistic, Intrapersonal**

Conductors and Insulators

If you reach for a metal doorknob after walking across a carpet, you might see a spark. The spark is caused by electrons moving from your hand to the doorknob, as shown in **Figure 5**. Recall that electrons were transferred from the carpet to your shoes. How did these electrons move from your shoes to your hand?

Conductors A material in which electrons are able to move easily is a **conductor**. Electrons on your shoes repel each other and some are pushed onto your skin. Because your skin is a better conductor than your shoes, the electrons spread over your skin, including your hand.

The best electrical conductors are metals. The atoms in metals have electrons that are able to move easily through the material. Electric wires usually are made of copper because copper metal is one of the best conductors.

Insulators A material in which electrons are not able to move easily is an **insulator**. Electrons are held tightly to atoms in insulators. Most plastics are insulators. The plastic coating around electric wires, such as the one shown in **Figure 6**, prevents a dangerous electric shock when you touch the wire. Other good insulators are wood, rubber, and glass.

Charging Objects

You might have noticed socks clinging to each other after they have been tumbling in a clothes dryer. Rubbing two materials together can result in a transfer of electrons. Then one material is left with a positive charge and the other with an equal amount of negative charge. The process of transferring charge by touching or rubbing is called **charging by contact**.

Figure 6 The plastic coating around wires is an insulator. A damaged electrical cord is hazardous when the conducting wire is exposed.

Explain how the coating on a wire prevents an electric shock.

Fun Fact

The process of charging by contact is known as *triboelectricity*. The triboelectric properties of materials are of significant interest to scientists working on missions to Mars. The dry, windy conditions on Mars provide an ideal environment for triboelectric charging.

Teacher FYI

Charging by Friction The process of charge transfer by rubbing is often called *charging by friction*. This term can be misleading because the process requires only light contact, not heating. The rubbing increases the area of contact, thereby enhancing the charge transfer.

Caption Answer

Figure 6 Electrons cannot travel easily through the insulator. The coating prevents the electrons in the wire from traveling into your body as an electric shock.

Active Reading

Cause-and-Effect Chart Have students design a cause-and-effect chart for static electricity. In the center, students write the topic, in this case, static electricity. To the left, they write the apparent causes of static electricity. On the right, they write the apparent effects of static electricity. **L2** **LS** **Mathematical, Visual-Spatial**

Differentiated Instruction

Challenge Have students investigate various conductors and insulators. Suggest that they design and make a circuit to test these objects. They also should make a chart to show which items are conductors and which are insulators. **L3** **LS** **P**

Kinesthetic

Caption Answer

Figure 7 from the balloon to the sweater

Discussion

Winter Shocks Why are you more likely to get shocked when you touch a door handle in the winter than in the summer? In winter, the air in homes and buildings is often dry. Dry air is an insulator and doesn't easily discharge the excess charge on your body. The charge is therefore more likely to remain until your hand nears a door handle. **L2**

Logical-Mathematical

Use Science Words

Word Meaning Ask students to look up the word *static* and tell one reason why this word is appropriate for the term *static electricity* and one reason why the word is misleading. The word *static* means "not moving." It is true that static electricity is not in continual motion like current electricity. However, a static discharge is far from motionless; it is a very rapid, though noncontinuous, transfer of charge. **L2** **Linguistic**

IDENTIFYING

Misconceptions

Franklin's Kite Students may have heard the tale of Benjamin Franklin's kite being struck by lightning. Fortunately, the kite was *not* struck by lightning, but a negative charge from the air collected on a wire attached to the kite and traveled down the wet string. The sparks Franklin observed enabled him to show (as French scientists had done a month before) the relation between lightning and electricity.

Figure 7 The balloon on the left is neutral. The balloon on the right is negatively charged. It produces a positively charged area on the sleeve by repelling electrons.

Determine the direction of the electric force acting on the balloon.

Charging at a Distance

Because electrical forces act at a distance, charged objects brought near a neutral object will cause electrons to rearrange their positions on the neutral object. Suppose you charge a balloon by rubbing it with a cloth. If you bring the negatively charged balloon near your sleeve, the extra electrons on the balloon repel the electrons in the sleeve. The electrons near the sleeve's surface move away from the balloon, leaving a positively charged area on the surface of the sleeve, as

shown in **Figure 7**. As a result, the negatively charged balloon attracts the positively charged area of the sleeve. The rearrangement of electrons on a neutral object caused by a nearby charged object is called **charging by induction**. The sweater was charged by induction. The balloon will now cling to the sweater, being held there by an electrical force.

Lightning Have you ever seen lightning strike Earth? Lightning is a large static discharge. A static discharge is a transfer of charge between two objects because of a buildup of static electricity. A thundercloud is a mighty generator of static electricity. As air masses move and swirl in the cloud, areas of positive and negative charge build up. Eventually, enough charge builds up to cause a static discharge between the cloud and the ground. As the electric charges move through air, they collide with atoms and molecules. These collisions cause the atoms and molecules in air to emit light. You see this light as a spark, as shown in **Figure 8**.

Thunder Not only does lightning produce a brilliant flash of light, it also generates powerful sound waves. The electrical energy in a lightning bolt rips electrons off atoms in the air and produces great amounts of thermal energy. The surrounding air temperature can rise to about 25,000°C—several times hotter than the Sun's surface. The hot air in the lightning bolt's path expands rapidly, producing sound waves that you hear as thunder.

The sudden discharge of so much energy can be dangerous. It is estimated that Earth is struck by lightning about 100 times every second. Lightning strikes can cause power outages, injury, loss of life, and fires.

Scienceonline

Topic: Lightning

Visit fl.gpscience.com for Web links to information about lightning strikes.

Activity Make a table listing tips on how people can protect themselves from lightning.

Science Journal

Thunderstorm Safety You often hear the warning, "Don't stand near a tree during a thunderstorm." Ask students to explain the reasoning behind this warning based on what they have learned in this section. Trees are more susceptible to lightning strikes because they are often the tallest objects around. **L2** **Logical-Mathematical**

Figure 8

Storm clouds can form when humid, Sun-warmed air rises to meet a colder air layer. As these air masses churn together, the stage is set for the explosive electrical display we call lightning. Lightning strikes when negative charges at the bottom of a storm cloud are attracted to positive charges on the ground.

A Convection currents in the storm cloud cause charge separation. The top of the cloud becomes positively charged, the bottom negatively charged.

B Negative charges on the bottom of the cloud induce a positive charge on the ground below the cloud by repelling negative charges in the ground.

C When the bottom of the cloud has accumulated enough negative charges, the attraction of the positive charges below causes electrons in the bottom of the cloud to move toward the ground.

D When the electrons get close to the ground, they attract positive charges that surge upward, completing the connection between cloud and ground. This is the spark you see as a lightning flash.

INTRACLOUD LIGHTNING never strikes Earth and can occur ten times more often in a storm than cloud-to-ground lightning.

SECTION 1 Electric Charge 397

Visualizing Lightning

Have students examine the pictures and read the captions. Then ask the following questions.

When the warm humid air rises to meet the cold air, what causes the air masses to churn together?
convection currents

What electric property causes the negative charges in the cloud to be attracted to the positive charges in the ground? **like charges repel and unlike charges attract**

Why does the ground below a cloud have a concentration of positive charges? **because the negative charges in the bottom of the cloud repel the negative charges in the ground and attract the positive charges** **L2** **IS**
Visual-Spatial, Logical-Mathematical

Activity

Lightning Posters Have students research the different types of lightning and have them make posters illustrating them. If possible, students also could include statistical data involving the number of strikes that occur per year in their area. **L2** **IS** **Visual-Spatial, Linguistic, Logical-Mathematical**

Differentiated Instruction

Challenge Have students find out more about storm chasers. These professionals intentionally go to areas where tornadoes, hurricanes, typhoons, etc. are occurring to study them. Students should report to the class what they learn. **L3** **IS** **Visual-Spatial**

Text Question Answer

Possible answers: faucet (if plumbing is metal), electrical outlet ground

Purpose Students analyze how charged objects interact with each other. **L1** **ELL** **IS** **Logical-Mathematical,**

IS **Kinesthetic**

Materials transparent tape

Teaching Strategy Cellophane tape often works, but transparent tape is better.

Analysis

1. The tapes attracted each other because they had opposite charges. When pulled apart, one became positively charged and one became negatively charged.
2. The pieces of tape repelled each other because they had like charges. Pulling both strips off the surface charged each the same way.

Assessment

Process Have students write up the procedures and results for this MiniLAB as lab reports. Use **Performance Assessment in the Science Classroom**, p. 119. **L2** **IS** **Linguistic**

Figure 9 A lightning rod directs the charge from a lightning bolt safely to the ground.

Investigating Charged Objects

Procedure

1. Fold over about 1 cm on the end of a **roll of transparent tape** to make a handle. Tear off a strip of tape about 10 cm long.
2. Stick the strip to a clean, dry, smooth surface, such as a countertop. Make another identical strip and stick it directly on top of the first.
3. Pull both pieces off the counter together and pull them apart. Then bring the nonsticky sides of both tapes together. What happens?
4. Now stick the two strips of tape side by side on the smooth surface. Pull them off and bring the nonsticky sides near each other again.

Analysis

1. What happened when you brought the pieces close together the first time? Were they charged alike or opposite? What might have caused this?
2. What did you observe when you brought the pieces together the second time? How were they charged? What did you do differently that might have changed the behavior?

Grounding The sensitive electronics in a computer can be harmed by large static discharges. A discharge can occur any time that charge builds up in one area. Providing a path for charge to reach Earth prevents any charge from building up. Earth is a large, neutral object that is also a conductor of charge. Any object connected to Earth by a good conductor will transfer any excess electric charge to Earth. Connecting an object to Earth with a

conductor is called grounding. For example, to prevent damage by lightning, buildings often have a metal lightning rod that provides a conducting path from the highest point on the building to the ground, as shown in **Figure 9**.

Plumbing fixtures, such as metal faucets, sinks, and pipes, often provide a convenient ground connection. Look around. Do you see anything that might act as a path to the ground?

Detecting Electric Charge

The presence of electric charges can be detected by an electroscope. One kind of electroscope is made of two thin, metal leaves attached to a metal rod with a knob at the top. The leaves are allowed to hang freely from the metal rod. When the device is not charged, the leaves hang straight down, as shown in **Figure 10A**.

Suppose a negatively charged rod touches the knob. Because the metal is a good conductor, electrons travel down the rod into the leaves. Both leaves become negatively charged as they gain electrons, as shown in **Figure 10B**. Because the leaves have similar charges, they repel each other.

If a glass rod is rubbed with silk, electrons move away from the atoms in the glass rod and build up on the silk. The glass rod becomes positively charged.

Visual Learning

Figure 9 The lightning rod's long, narrow shape causes charges induced into it to bunch together and produce a strong electric field. This electric field causes nearby air molecules to be ionized, enabling charges to travel from the storm cloud to the lightning rod. This reduces the likelihood of a lightning strike elsewhere. Look for lightning rods on buildings in your area. **L2** **IS** **Visual-Spatial**

Post Reading

Question A Partner Put students in pairs and ask them to review the contents of the chapter by using their notes. Have them form three questions that are central to the learning in this section. They should then take turns asking the class their questions and monitoring responses for accuracy and completeness.

Figure 10 Notice the position of the leaves on the electroscope when they are **A** uncharged, **B** negatively charged, and **C** positively charged.

Infer How can you tell whether an electroscope is positively or negatively charged?

When the positively charged glass rod is brought into contact with the metal knob of an uncharged electroscope, electrons flow out of the metal leaves and onto the rod. The leaves repel each other because each leaf becomes positively charged as it loses electrons, as shown in **Figure 10C**.

section 1 review

Summary

Positive and Negative Charge

- There are two types of electric charge: positive charge and negative charge.
- Electric charges can be transferred between objects but cannot be created or destroyed.
- Like charges repel and unlike charges attract.
- An electric charge is surrounded by an electric field that exerts forces on other charges.

Electrical Conductors and Insulators

- A conductor contains electrons that can move easily. The best conductors are metals.
- The electrons in an electrical insulator do not move easily. Rubber, glass, and most plastics are examples of insulators.

Charging Objects

- Electric charge can be transferred between objects by bringing them into contact.
- Charging by induction occurs when the electric field around a charged object rearranges electrons in a nearby neutral object.

Self Check

1. **Define** static electricity.
2. **Describe** how lightning is produced.
3. **Explain** why electrically neutral objects can become electrically charged even though charge cannot be created or destroyed.
4. **Predict** what would happen if you touched the knob of a positively charged electroscope with another positively charged object.
5. **Think Critically** Humid air is a better electrical conductor than dry air. Explain why you're more likely to receive a shock after walking across a carpet when the air is dry than when the air is humid.

Applying Math

6. **Determine Lightning Strikes** Earth is struck by lightning 100 times each second. How many times is Earth struck by lightning in one day?
7. **Calculate Electric Force** A balloon with a mass of 0.020 kg is charged by rubbing and then is stuck to the ceiling. If the acceleration of gravity is 9.8 m/s^2 , what is the electrical force on the balloon?

New Vocabulary

- electric current
- voltage difference
- circuit
- resistance
- Ohm's law

Current and Voltage Difference

Figure 11 Electric forces in a material cause electric current to flow, just as forces in the water cause water to flow.

The force that causes water to flow is related to a pressure difference.

The force that causes a current to flow is related to a voltage difference.

When a spark jumps between your hand and a metal door-knob, electric charges move quickly from one place to another. The net movement of electric charges in a single direction is an **electric current**. In a metal wire, or any material, electrons are in constant motion in all directions. As a result, there is no net movement of electrons in one direction. However, when an electric current flows, electrons continue their random movement, but they also drift in the direction that the electron current flows.

Electric current is measured in amperes. One ampere is equal to 6,250 million billion electrons flowing past a point every second.

Reading Check What is electric current?

Voltage Difference The movement of an electron in an electric current is similar to a ball bouncing down a flight of stairs. Even though the ball changes direction when it strikes a stair, the net motion of the ball is downward. The downward motion of the ball is caused by the force of gravity. When a current flows, the net movement of electric charges is caused by an electric force acting on the charges.

In some ways, the electric force that causes charges to flow is similar to the force acting on the water in a pipe. Water flows from higher pressure to lower pressure, as shown in **Figure 11**. In a similar way, electric charge flows when there is a voltage difference. A **voltage difference** is related to the force that causes electric charges to flow. Voltage difference is measured in volts.

Figure 12 Water or electric current will flow continually only through a closed loop. If any part of the loop is broken or disconnected, the flow stops.

A pump provides the pressure difference that keeps water flowing.

A battery provides the voltage difference that keeps electric current flowing.

Electric Circuits One way to have flowing water perform work is shown in **Figure 12**. Water flows out of the tank and falls on a paddle wheel, causing it to rotate. A pump then provides a pressure difference that lifts the water back up into the tank. The constant flow of water would stop if the pump stopped working. The flow of water also would stop if one of the pipes broke. Then water no longer could flow in a closed loop, and the paddle wheel would stop rotating.

Figure 12 also shows an electric current doing work by lighting a lightbulb. Just as the water current stops flowing if there is no longer a closed loop to flow through, the electric current stops if there is no longer a closed path to follow. A closed path that electric current follows is a **circuit**. If the circuit in **Figure 12** is broken by removing the battery, the lightbulb, or one of the wires, current will not flow.

Batteries

To keep water flowing continually in the water circuit in **Figure 12**, a pump is used to provide a pressure difference. In a similar way, to keep an electric current continually flowing in the electric circuit in **Figure 12**, a voltage difference needs to be maintained in the circuit. A battery can provide the voltage difference that is needed to keep current flowing in a circuit. Current flows as long as there is a closed path that connects one battery terminal to the other battery terminal.

Visual Learning

Figure 12 Use the figure to have students identify the corresponding parts of the water flow to electric current analogy. **pipes-wires; pump-battery; water wheel-lightbulb**   **Visual-Spatial**

Teacher FYI

Battery Makeup A 9-volt battery is actually composed of six small 1.5-volt batteries connected in series. A 12-volt car battery is a series of six 2-volt batteries.

Reading Check

Answer the net movement of electric charge in a single direction

IDENTIFYING

Misconceptions

Current Early researchers established the convention that current flows from the positive terminal to the negative terminal of a battery. After the discovery of the electron, researchers realized that the electrons actually move from the negative terminal to the positive terminal. Today, we talk about conventional current, which is the direction of the hypothetical flow of positive charges. However, it is negatively-charged electrons that flow in a wire. It is important for students to learn these distinctions and to realize that positive charges do not flow through the wire.

Quick Demo Simple Cells

Materials small glass or plastic container about three-fourths full of acid solution (lemon juice, tomato juice, or vinegar), strip of copper, strip of zinc or silver, two wires with alligator clips, sensitive voltmeter (0-1 VDC)

Estimated Time five minutes

Procedure Clip one end of a wire to one metal strip and the other end to the voltmeter. Repeat for the second metal strip and wire. Place the metal strips in the acid solution, taking care that the strips do not touch each other. Have a student read the voltage difference that the cell produces between the two electrodes.

Mini LAB

Purpose Students discover the effect of adding an additional battery to a circuit. **COOP LEARN**

L2 Kinesthetic, Visual-Spatial, Logical-Mathematical

Materials D-cell batteries (2), 3-volt bulbs and sockets (3), insulated wire

Teaching Strategy Tell students to leave the bulbs burning only long enough to make observations. Caution them to not touch a hot bulb.

Troubleshooting Connecting more than two batteries per lamp in series will shorten the bulb's life or cause it to burn out.

Analysis

1. 1.5 volts, 3.0 volts
2. As the voltage difference increases across the lamp, the charge flowing through it increases.

Assessment

Performance Have students design and label several possible arrangements showing how to light a bulb at different levels of brightness. Have them demonstrate each method. Use **PASC**, p. 127. **L2 Kinesthetic, Visual-Spatial**

Content Background

Each cell of a battery has an *electrolyte* (a chemical that conducts charge) and two *electrodes* (terminals). One electrode provides electrons to the electrolyte. The other electrode takes electrons from the electrolyte. In dry cells the electrolyte is a paste, and in wet cells it is a liquid.

Mini LAB

Investigating Battery Addition

Procedure

1. Make a circuit by using wire to link two bulbs and one D-cell battery in a loop. Observe the brightness of the bulbs.
2. Assemble a new circuit by linking two bulbs and two D-cell batteries in a loop. Observe the brightness of the bulbs.

Analysis

1. What is the voltage difference of each D cell? Add them together to find the total voltage difference for the circuit you tested in step 2.
2. Assuming that a brighter bulb indicates a greater current, what can you conclude about the relationship between the voltage difference and current?

Dry-Cell Batteries You probably are most familiar with dry-cell batteries. A cell consists of two electrodes surrounded by a material called an electrolyte. The electrolyte enables charges to move from one electrode to the other. Look at the dry cell shown in **Figure 13**. One electrode is the carbon rod, and the other is the zinc container. The electrolyte is a moist paste containing several chemicals. The cell is called a dry cell because the electrolyte is a moist paste, not a liquid solution.

When the two terminals of a dry-cell battery are connected in a circuit, such as in a flashlight, a reaction involving zinc and several chemicals in the paste occurs. Electrons are transferred between some of the compounds in this chemical reaction. As a result, the carbon rod becomes positive, forming the positive (+) terminal. Electrons accumulate on the zinc, making it the negative (−) terminal.

The voltage difference between these two terminals causes current to flow through a closed circuit. You make a battery when you connect two or more cells together to produce a higher voltage difference.

Wet-Cell Batteries Another commonly used type of battery is the wet-cell battery. A wet cell, like the one shown in **Figure 13**, contains two connected plates made of different metals or metallic compounds in a conducting solution. A wet-cell battery contains several wet cells connected together.

Figure 13 Chemical reactions in batteries produce a voltage difference between the positive and negative terminals.

Identify when these chemical reactions occur.

In this dry cell, chemical reactions in the moist paste transfer electrons to the zinc container.

In this wet cell, chemical reactions transfer electrons from the lead plates to the lead-dioxide plates.

Caption Answer

Figure 13 The chemical reactions occur when the battery is connected in a circuit.

Differentiated Instruction

Learning Disabled To emphasize the usefulness of batteries, ask students to list as many things as they can think of that use batteries. Encourage them to think of many different size batteries, from watch batteries to car batteries.

Lead-Acid Batteries Most car batteries are lead-acid batteries, like the wet-cell battery shown in **Figure 13**. A lead-acid battery contains a series of six wet cells made up of lead and lead dioxide plates in a sulfuric acid solution. The chemical reaction in each cell provides a voltage difference of about 2 V, giving a total voltage difference of 12 V. As a car is driven, the alternator recharges the battery by sending current through the battery in the opposite direction to reverse the chemical reaction.

A voltage difference is provided at electrical outlets, such as a wall socket. This voltage difference usually is higher than the voltage difference provided by batteries. Most types of household devices are designed to use the voltage difference supplied by a wall socket. In the United States, the voltage difference across the two holes in a wall socket is usually 120 V. Some wall sockets supply 240 V, which is required by appliances such as electric ranges and electric clothes dryers.

Resistance

Flashlights use dry-cell batteries to provide the electric current that lights a lightbulb. What makes a lightbulb glow? Look at the lightbulb in **Figure 14**. Part of the circuit through the bulb is a thin wire called a filament. As the electrons flow through the filament, they bump into the metal atoms that make up the filament. In these collisions, some of the electrical energy of the electrons is converted into thermal energy. Eventually, the metal filament becomes hot enough to glow, producing radiant energy that can light up a dark room.

Resisting the Flow of Current Electric current loses energy as it moves through the filament because the filament resists the flow of electrons. **Resistance** is the tendency of a material to oppose the flow of electrons, changing electrical energy into thermal energy and light. With the exception of some substances that become superconductors at low temperatures, all materials have some electrical resistance. Electrical conductors have much less resistance than insulators. Resistance is measured in ohms (Ω).

Copper is an excellent conductor and has low resistance to the flow of electrons. Copper is used in household wiring because only a small amount of electrical energy is converted to thermal energy as current flows in copper wires.

Figure 14 As electrons move through the filament in a lightbulb, they bump into metal atoms. Due to the collisions, the metal heats up and starts to glow.

Describe the energy conversions that occur in a lightbulb filament.

IDENTIFYING Misconceptions

Voltage Students sometimes think that voltage is the same at different places in a circuit and it exists only when current flows. See page 192F for teaching strategies that address this misconception.

Use an Analogy

Water Flow You can describe resistance by building on the analogy of charge flow being similar to water flow. Suppose a jug of water has a large hole in one side and a small hole in the other side. More water will flow out of the large hole. Similarly, a wire with a large diameter has less resistance and therefore carries greater current than a smaller-diameter wire.

Discussion

Making Thermal Energy Should the heating elements on a stove top be made of high-resistance or low-resistance material? **high-resistance** **L2** **KS** **Logical-Mathematical**

Caption Answer

Figure 14 Electrical energy is converted into thermal energy and radiant energy.

Activity

Reading Strategy

Context Clues Assign a new vocabulary word to each student. Have students look up the words in the chapter. Then, have them create a sentence using the word in a way that will allow a partner to predict its meaning. Clarify meanings as needed.

Curriculum Connection

Math In a car battery, the following chemical reaction occurs: $\text{Pb} + \text{PbO}_2 + \text{H}_2\text{SO}_4 \rightarrow \text{PbSO}_4 + \text{H}_2\text{O}$. Use coefficients to balance this equation.
 $\text{Pb} + \text{PbO}_2 + 2\text{H}_2\text{SO}_4 \rightarrow 2\text{PbSO}_4 + 2\text{H}_2\text{O}$

✓ Reading Check

Answer The resistance increases as the length of the wire increases and as its thickness decreases.

IDENTIFYING

Misconceptions

Static Danger When it comes to electricity and our bodies, it often is true that high voltages are dangerous and low voltages are safer. Students frequently are not aware of a common situation where this is not true. In many static electricity situations, such as walking across a carpet, sparks of 1,500 volts or higher are generated. No damage occurs to our bodies because there is little actual current flow.

Virtual Labs

Electric Charges How are current, voltage, and resistance related?

Post Reading

Compare and Contrast Ask students to write a brief summary of a wet cell, a dry cell, and lead-acid batteries by using comparison/contrast words such as *both*, *in comparison*, *the difference between*, *more*, *less*, or *about the same*. For example, Both wet cell and lead-acid batteries use lead as a component, but dry cells do not.

Temperature, Length, and Thickness The electric resistance of most materials usually increases as the temperature of the material increases. The resistance of an object such as a wire also depends on the length and diameter of the wire. The resistance of a wire, or any conductor, increases as the wire becomes longer. The resistance also increases as the wire becomes thinner.

In a 60-W lightbulb, the filament is a piece of tungsten wire made into a short coil a few centimeters long. The uncoiled wire is about 2 m long and only about 0.25 mm thick. Even though tungsten metal is a good conductor, by making the wire thin and long, the resistance of the filament is made large enough to cause the bulb to glow.

✓ Reading Check

How does changing the length and thickness of a wire affect its resistance?

The Current in a Simple Circuit

A simple electric circuit contains a source of voltage difference, such as a battery, a device that has resistance, such as a lightbulb, and conductors that connect the device to the battery terminals. When the wires are connected to the battery terminals, current flows in the closed path. An example of a simple circuit is shown in **Figure 15**.

The voltage difference, current, and resistance in a circuit are related. If the voltage difference doesn't change, decreasing the resistance increases the current in the circuit, as shown in **Figure 15**. Also, if the resistance doesn't change, increasing the voltage difference increases the current.

Figure 15 The amount of current flowing through a circuit is related to the amount of resistance in the circuit.

When the clips on the graphite rod are farther apart, the resistance of the rod in the circuit is larger. As a result, less current flows in the circuit and the lightbulb is dim.

When the clips on the graphite rod are closer together, the resistance of the rod in the circuit is less. As a result, more current flows in the circuit and the lightbulb is brighter.

Teacher FYI

High-Temperature Conductivity Conductivity depends on temperature. A higher temperature causes more movement of atoms and generally results in lower conductivity. However, the increased movement of atoms

in some substances, such as carbon and semiconductors, frees electrons so that higher temperatures for these substances results in higher conductivity.

Ohm's Law The relationship among voltage difference, current, and resistance in a circuit is known as Ohm's law. According to **Ohm's law**, the current in a circuit equals the voltage difference divided by the resistance. Ohm's law can be written as the following equation, where I stands for electric current.

Ohm's Law

$$\text{current (in amperes)} = \frac{\text{voltage difference (in volts)}}{\text{resistance (in ohms)}}$$

$$I = \frac{V}{R}$$

Ohm's law provides a way to measure the resistance of objects and materials. First, the equation above is written as:

$$R = \frac{V}{I}$$

An object is connected to a source of voltage difference and the current flowing in the circuit is measured. The object's resistance then equals the voltage difference divided by the measured current.

section 2 review

Summary

Current and Voltage Difference

- Electric current is the net movement of electric charge in a single direction.
- A voltage difference is related to the force that causes charges to flow.
- A circuit is a closed, conducting path.

Batteries

- Chemical reactions in a battery produce a voltage difference between the positive and negative battery terminals.
- Two commonly used types of batteries are dry-cell batteries and wet-cell batteries.

Resistance and Ohm's Law

- Resistance is the tendency of a material to oppose the flow of electrons.
- Ohm's law relates the current, I , resistance, R , and voltage difference, V , in a circuit:

$$I = \frac{V}{R}$$

Self Check

1. **Compare and contrast** a current traveling through a circuit with a static discharge.
2. **Explain** how a carbon-zinc dry cell produces a voltage difference between the positive and negative terminals.
3. **Identify** two ways to increase the current in a simple circuit.
4. **Compare and contrast** the flow of water in a pipe and the flow of electrons in a wire.
5. **Think Critically** Explain how the resistance of a lightbulb filament changes after the light has been turned on.

Applying Math

6. **Calculate** the voltage difference in a circuit with a resistance of 25 ohms if the current is 0.5 A.
7. **Calculate Resistance** A current of 0.5 A flows in a 60-W lightbulb when the voltage difference between the ends of the filament is 120 V. What is the resistance of the filament?

Current and the Human Body When an electric shock occurs, an electric current moves through some part of the body. The damage caused by an electric shock depends on how large the current is. Research the effects of current on the human body. Make a table showing the effects on the body at different amounts of current.

Current and the Human Body Currents of about 0.5 mA can cause a slight shock to a person. Higher currents cause increasing degrees of pain and loss of muscle control. Currents higher than about 150 mA will likely result in death.

Process collect data, make and use tables, record observations, draw conclusions

Time Required 40 minutes

Procedure

Teaching Strategy Have a collection of items ready for students to test, but let students offer additional items to be tested.

Troubleshooting Make sure all connections in the circuit have good contact.

Conclude and Apply

1. Answers will vary. Students should realize that metallic items will conduct electricity.
2. They are metallic.
3. They are nonmetallic.
4. Materials that allow the lightbulb to glow have metallic bonding. Materials that do not allow the lightbulb to glow are nonmetallic.
5. Metallic materials will conduct electricity; bad connections will prevent the lightbulb from lighting.
6. Answers will vary.

Identifying Conductors and Insulators

The resistance of an insulator is so large that only a small current flows when it is connected in a circuit. As a result, a lightbulb connected in a circuit with an insulator usually will not glow. In this lab, you will use the brightness of a lightbulb to identify conductors and insulators.

Real-World Problem

What materials are conductors and what materials are insulators?

Goals

- **Identify** conductors and insulators.
- **Describe** the common characteristics of conductors and insulators.

Materials

battery	bulb holder
flashlight bulb	insulated wire

Safety Precautions

Procedure

1. Set up an incomplete circuit as pictured in the photograph.
2. Touch the free bare ends of the wires to various objects around the room. Test at least 12 items.
3. Copy the table below. In your table, record which materials make the lightbulb glow and which don't.

Material Tested with Lightbulb Circuit

Lightbulb Glows

Lightbulb Doesn't Glow

Results will vary

Results will vary

Conclude and Apply

1. Is there a pattern to your data?
2. Do all or most of the materials that light the lightbulb have something in common?
3. Do all or most of the materials that don't light the lightbulb have something in common?
4. **Explain** why one material might allow the lightbulb to light and another might prevent the lightbulb from lighting.
5. **Predict** what other materials will allow the lightbulb to light and what will prevent the lightbulb from lighting.
6. **Classify** all the materials you have tested as conductors or insulators.

Communicating Your Data

Compare your conclusions with those of other students in your class. For more help, refer to the **Science Skill Handbook**.

Electrical Energy

Reading Guide

What You'll Learn

- **Describe** the difference between series and parallel circuits.
- **Recognize** the function of circuit breakers and fuses.
- **Calculate** electrical power.
- **Calculate** the electrical energy used by a device.

Why It's Important

When you use an electric appliance, such as a hair dryer or a toaster oven, you pay for the electrical energy you use.

Review Vocabulary

energy: the ability to cause change

New Vocabulary

- series circuit
- parallel circuit
- electrical power

Series and Parallel Circuits

Look around. How many electrical devices such as lights, clocks, stereos, and televisions do you see that are plugged into electrical outlets? Circuits usually include three components. One is a source of voltage difference that can be provided by a battery or an electrical outlet. Another is one or more devices that use electrical energy. Circuits also include conductors such as wires that connect the devices to the source of voltage difference to form a closed path.

Think about using a hair dryer. The dryer must be plugged into an electrical outlet to operate. A generator at a power plant produces a voltage difference across the outlet, causing charges to move when the circuit is complete. The dryer and the circuit in the house contain conducting wires to carry current. The hair dryer turns the electrical energy into thermal energy and mechanical energy. When you unplug the hair dryer or turn off its switch, you open the circuit and break the path of the current. To use electrical energy, a complete circuit must be made. There are two kinds of circuits.

Series Circuits One kind of circuit is called a series circuit. In a **series circuit**, the current has only one loop to flow through, as shown in **Figure 16**. Series circuits are used in flashlights and some holiday lights.

Reading Check How many loops are in a series circuit?

Figure 16 A series circuit provides only one path for the current to follow.

INTEGRATE Career

Electrician The installation of electrical wiring in any building usually requires an electrician. Electricians must have a thorough understanding of electricity. They also must constantly be aware of the safety issues involved in working with electricity. Write a paragraph describing other skills that electricians must have.

Open Circuits If you have ever decorated a window or a tree with a string of lights, you might have had the frustrating experience of trying to find one burned-out bulb. How can one faulty bulb cause the whole string to go out? Because the parts of a series circuit are wired one after another, the amount of current is the same through every part. When any part of a series circuit is disconnected, no current flows through the circuit. This is called an open circuit. The burned-out bulb causes an open circuit in the string of lights.

Parallel Circuits What would happen if your home were wired in a series circuit and you turned off one light? This would cause an open circuit, and all the other lights and appliances in your home would go out, too. This is why houses are wired with parallel circuits. **Parallel circuits** contain two or more branches for current to move through. Look at the parallel circuit in **Figure 17**. The current can flow through both or either of the branches. Because all branches connect the same two points of the circuit, the voltage difference is the same in each branch. Then, according to Ohm's law, more current flows through the branches that have lower resistance.

Parallel circuits have several advantages. When one branch of the circuit is opened, such as when you turn a light off, the current continues to flow through the other branches. Houses, automobiles, and most electrical systems use parallel wiring so individual parts can be turned off without affecting the entire circuit.

Figure 17 In parallel circuits, the current follows more than one path. **Describe** how the voltage difference will compare in each branch.

LAB DEMONSTRATION

Purpose to demonstrate series and parallel circuits

Materials battery, small lightbulbs (2), ammeters (2), wire

Procedure Set up a series circuit with the two lightbulbs. Include ammeters in two places in the circuit. Disconnect one lamp

so the circuit is broken. Do the same for a parallel circuit.

Expected Outcome In the series circuit, the entire circuit is broken when the lamp is disconnected. For the parallel circuit, the circuit is only broken in the branch with the disconnected lamp.

Assessment

Why do results differ for the two circuits? **Series-current** has only one path so it is the same everywhere; **parallel-current** has two paths, so it is split between the paths. **L2** **IS** **Logical-Mathematical, Visual-Spatial**

Figure 18 The wiring in a house must allow for the individual use of various appliances and fixtures. **Identify** the type of circuit that is most common in household wiring.

Household Circuits

Count how many different things in your home require electrical energy. You don't see the wires because most of them are hidden behind the walls, ceilings, and floors. This wiring is mostly a combination of parallel circuits connected in an organized and logical network. **Figure 18** shows how electrical energy enters a home and is distributed. In the United States, the voltage difference in most of the branches is 120 V. In some branches that are used for electric stoves or electric clothes dryers, the voltage difference is 240 V. The main switch and circuit breaker or fuse box serve as an electrical headquarters for your home. Parallel circuits branch out from the breaker or fuse box to wall sockets, major appliances, and lights.

In a house, many appliances draw current from the same circuit. If more appliances are connected, more current will flow through the wires. As the amount of current increases, so does the amount of heat produced in the wires. If the wires get too hot, the insulation can melt and the bare wires can cause a fire. To protect against overheating of the wires, all household circuits contain either a fuse or a circuit breaker.

SECTION 3 Electrical Energy 409

Activity

Circuit Diagrams Draw several circuit diagrams on the board and have students identify them either as series circuits or as parallel circuits. At this point, avoid combination series/parallel circuits.

L2 **Visual-Spatial**

Caption Answer

Figure 18 parallel circuit

Quick Demo

Series or Parallel Circuit?

Materials string of miniature lights (should be three-wire type)

Estimated Time 10 minutes

Procedure Hang the string of lights across the front of the classroom and plug them in. Have students predict whether the circuit is series or parallel. Remove one bulb from the first half of the string. One section of the lights should go out. Discuss why one section went out but not the other. Have a student draw a possible circuit diagram on the board. **L2**

Visual-Spatial, Logical-Mathematical, Kinesthetic

Teacher FYI

Resistance In a series circuit, total resistance is equal to the sum of the individual resistances: $R_{\text{total}} = R_1 + R_2 + \dots$. In a parallel circuit, the total resistance is calculated as follows: $1/R_{\text{total}} = 1/R_1 + 1/R_2 + \dots$. The total resistance is less than any single resistance in a parallel circuit.

Visual Learning

Figure 18 Students should notice that all wiring in the house first runs through the fuse box or circuit breaker for protection. Why are three lines shown in the wiring? **One line is ground; the other two are for the closed-current path.** **L2** **Visual-Spatial, Logical-Mathematical**

Caption Answer

Figure 19 A circuit breaker, because it can be easily reset, whereas a fuse must be replaced.

Make a Model

Fuses Students can learn about the behavior of fuses by constructing a simple circuit containing a battery and a lightbulb. To model a fuse, include as part of the circuit's wiring a strip of aluminum foil about 3 cm long. The strip should have a thin middle section that is about 1 mm wide. When the circuit is completed, the thin part of the foil will quickly melt, opening the circuit, and the light will go out, as occurs when a real fuse blows.

L2 IS Kinesthetic, Visual-Spatial

✓ Reading Check

Answer to protect against overheating and possible fire if the current in a wire becomes too high

Discussion

Blowing a Fuse Why is "blowing a fuse" an appropriate phrase to mean losing one's temper? Possible answer: too much current through a circuit causes a fuse to blow just as too many maddening incidents cause you to lose control of your temper.

Linguistic

A

B

Figure 19 Two useful devices to prevent electric circuits from overheating are **A** fuses and **B** circuit breakers. **Evaluate** which device, a fuse or a circuit breaker, would be more convenient to have in the home.

loaded circuit. To enable current to flow again in the circuit, you must replace the blown fuse with a new one. However, before you replace the blown fuse, you should turn off or unplug some of the appliances. Too many appliances in use at the same time is the most likely cause of the overheating of the circuit.

Circuit Breaker A circuit breaker, shown in **Figure 19B**, is another device that prevents a circuit from overheating and causing a fire. A circuit breaker contains a piece of metal that bends when the current in it is so large that it gets hot. The bending causes a switch to flip and open the circuit, stopping the flow of current. Circuit breakers usually can be reset by pushing the switch to its "on" position. Again, before you reset a circuit breaker, you should turn off or unplug some of the appliances from the overloaded circuit. Otherwise, the circuit breaker will switch off again.

✓ Reading Check

What is the purpose of fuses and circuit breakers in household circuits?

Electrical Power

The reason why electricity is so useful is that electrical energy is converted easily to other types of energy. For example, electrical energy is converted to mechanical energy as the blades of a fan rotate to cool you. Electrical energy is converted to light energy in lightbulbs. A hair dryer changes electrical energy into thermal energy. The rate at which electrical energy is converted to another form of energy is the **electrical power**.

The electrical power used by appliances varies. Appliances often are labeled with a power rating that describes how much power the appliance uses, as shown in **Figure 20**. Appliances that have electric heating elements, such as ovens and hair dryers, usually use more electrical power than other appliances.

Figure 20 All appliances come with a power rating.

410 CHAPTER 13 Electricity

Cultural Diversity

Electric Lighting Lewis H. Latimer, the son of a former slave, taught himself to be a draftsman when he was a teenager. In 1880, Latimer was hired by the United States Electric Lighting Company, where he invented the first carbon-filament electric lamp and an inexpensive way to produce the filaments. In 1883, he joined

Thomas Edison, and in 1890, he published the first textbook on electric lighting—*Incandescent Electric Lighting*. In 1918, the Edison Pioneers organization was formed to honor some of the people who worked with Thomas Edison as the "creators of the electric industry." One member was Lewis H. Latimer.

Calculating Electrical Power The electrical power used depends on the voltage difference and the current. Electrical power can be calculated from the following equation.

Electrical Power Equation

$$\text{electrical power (in watts)} = \text{current (in amperes)} \times \text{voltage difference (in volts)}$$

$$P = I \times V$$

The unit for power is the watt (W). Because the watt is a small unit of power, electrical power is often expressed in kilowatts (kW). One kilowatt equals 1,000 watts.

Applying Math Solve a Simple Equation

POWER USED BY A CLOTHES DRYER The current in an electric clothes dryer is 15 A when it is plugged into a 240-V outlet. How much power does the clothes dryer use?

IDENTIFY known values and the unknown value

Identify the known values:

current in the clothes dryer is 15 A $\xrightarrow{\text{means}}$ $I = 15 \text{ A}$

plugged into a 240-V outlet $\xrightarrow{\text{means}}$ $V = 240 \text{ V}$

Identify the unknown value:

how much power does the clothes dryer use $\xrightarrow{\text{means}}$ $P = ? \text{ W}$

SOLVE the problem

Substitute the known values $I = 15 \text{ A}$ and $V = 240 \text{ V}$ into the electrical power equation:

$$P = IV = (15 \text{ A})(240 \text{ V}) = 3,600 \text{ W} = 3.6 \text{ kW}$$

CHECK the answer

Does your answer seem reasonable? Check your answer by dividing the power you calculated by the current given in the problem. The result should be the voltage difference given in the problem.

Practice Problems

1. A toaster oven is plugged into an outlet that provides a voltage difference of 120 V. What power does the oven use if the current is 10 A?
2. A VCR that is not playing still uses 10.0 W of power. What is the current if the VCR is plugged into a 120-V electrical outlet?
3. A flashlight bulb uses 2.4 W of power when the current in the bulb is 0.8 A. What is the voltage difference?

For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

Use Science Words

Word Origin Many units of measurement in science are named for people who did related research. Have students investigate the origins of the words *ampere*, *watt*, and *volt*. The ampere is named after André Marie Ampère, who proposed the relationship between electricity and magnetism. The watt is named after James Watt, who created the first efficient steam engine and first used the word horsepower. The volt is named after Alessandro Volta, who observed that a conducting liquid produced a continuous transfer of electrons, a phenomenon later called electric current.

Applying Math

National Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.1

Answers to Practice Problems

$$1. P = (10 \text{ A})(120 \text{ V}) = 1200 \text{ W}$$

$$2. I = \frac{P}{V} = \frac{10.0 \text{ W}}{120 \text{ V}} = 0.833 \text{ A}$$

$$3. V = \frac{P}{I} = \frac{2.4 \text{ W}}{0.8 \text{ A}} = 3 \text{ V}$$

Reading Strategy

Fix-Up Strategy Choose a challenging piece of text, such as the Applying Math section, and read it aloud while interjecting questions and strategies to aid comprehension. Show students how to use the related equations to aid in comprehension. Then have students try the next Applying Math section as they work in pairs.

Science Journal

Power, Voltage, Current, and Resistance Remind students that they have been given Ohm's law and the formula for electric power. Have them write both formulas in their Science Journals and combine them to relate power to resistance. $I = V/R$; $P = IV$; therefore $P = V/R \times V = V^2/R$; also, $V = IR$, so $P = I \times IR = I^2 R$. **L2** **IS** Linguistic, Logical-Mathematical

Fun Fact

Benjamin Franklin was first to use the terms *positive* and *negative* to describe charged objects. He also invented the lightning rod.

Applying Math

National Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.1

Answers to Practice Problems

$$1. E = Pt, E = (0.7 \text{ kW})(10.0 \text{ h}) = 7 \text{ kWh}$$

$$2. t = \frac{E}{P} t = \frac{(0.8 \text{ kWh})}{(0.2 \text{ kW})} = 4 \text{ h}$$

Science

Topic: Energy

Visit fl.gpscience.com for Web links to information about the cost of electrical energy around the country.

Activity Using a blank map of the United States, create a key showing the relative energy costs in different states in different colors. With a partner, color in the states to create a visual map of energy costs. Give your map a title.

Electrical Energy Using electrical power costs money. However, electric companies charge by the amount of electrical energy used rather than by the electrical power used. Electrical energy usually is measured in units of kilowatt-hours (kWh) and can be calculated from this equation:

Electrical Energy Equation

$$\text{electrical energy (in kWh)} = \text{electrical power (in kW)} \times \text{time (in hours)}$$

$$E = Pt$$

In the above equation, electrical power is in units of kW and the time is the number of hours that the electrical power is used.

Applying Math

Solve a Simple Equation

ELECTRICAL ENERGY USED BY A MICROWAVE OVEN A microwave oven with a power rating of 1,200 W is used for 0.25 h. How much electrical energy is used by the microwave oven?

IDENTIFY known values and the unknown value

Identify the known values:

power rating of 1,200 W $\xrightarrow{\text{means}} P = 1,200 \text{ W} = 1.2 \text{ kW}$

is used for 0.25 h $\xrightarrow{\text{means}} t = 0.25 \text{ h}$

Identify the unknown value:

how much electrical energy is used $\xrightarrow{\text{means}} E = ? \text{ kWh}$

SOLVE the problem

Substitute the known values $p = 1.2 \text{ kW}$ and $t = 0.25 \text{ h}$ into the electrical energy equation:

$$E = Pt = (1.2 \text{ kW})(0.25 \text{ h}) = 0.30 \text{ kWh}$$

CHECK your answer

Does your answer seem reasonable? Check your answer by dividing the electrical energy you calculated by the power given in the problem. The results should be the time given in the problem.

Practice Problems

1. A refrigerator operates on average for 10.0 h a day. If the power rating of the refrigerator is 700 W, how much electrical energy does the refrigerator use in one day?
2. A TV with a power rating of 200 W uses 0.8 kWh in one day. For how many hours was the TV on during this day?

For more practice problems go to page 879, and visit Math Practice at fl.gpscience.com.

Differentiated Instruction

Challenge Have students work in pairs to research and build a Leyden jar, a device used to store electric energy. **WARNING:** Warn students not to use any flammable materials in their construction.  
Visual-Spatial, Kinesthetic **COOP LEARN**

Teacher FYI

Horsepower In the United States, the power of car engines is rated using the British unit horsepower (hp). One horsepower is equal to 746 watts.

The Cost of Using Electrical Energy

The cost of using an appliance can be computed by multiplying the electrical energy used by the amount the power company charges for each kWh. For example, if a 100-W lightbulb is left on for 5 h, the amount of electrical energy used is

$$E = Pt = (0.1 \text{ kW})(5 \text{ h}) = 0.5 \text{ kWh}$$

If the power company charges \$0.10 per kWh, the cost of using the bulb for 5 h is

$$\begin{aligned} \text{cost} &= (\text{kWh used})(\text{cost per kWh}) \\ &= (0.5 \text{ kWh})(\$0.10/\text{kWh}) = \$0.05 \end{aligned}$$

The cost of using some household appliances is given in **Table 1**, where the cost per kWh is assumed to be \$0.09/kWh.

Table 1 Cost of Using Home Appliances

Appliance	Hair Dryer	Stereo	Color Television
Power rating	1,000	100	200
Hours used daily	0.25	2.0	4.0
kWh used monthly	7.5	6.0	24.0
Cost per kWh	\$0.09	\$0.09	\$0.09
Monthly cost	\$0.68	\$0.54	\$2.16

Post Reading

Discussion Have students discuss what they have learned about electricity in small groups. Ask one student to facilitate the discussion, another to record the comments, and a third to report to the class. Provide the following prompts: How does the measurement system for electricity work? What causes static electricity? How do products reduce it in clothing?

3 Assess

DAILY INTERVENTION

Check for Understanding

Visual-Spatial Have students work in pairs to draw a model of the lights, switches, and wall outlets that are in the classroom. The drawing should be similar to that shown in Figure 18 and show that switches are wired in series while outlets and some lights are wired in parallel. **L2 LS Interpersonal, Visual-Spatial**

Reteach

Process Bring in an energy rating label from a new appliance. Have students use the voltage and current specifications of the appliance to determine its power, the energy it will use, and the cost of operation. **L2 LS Visual-Spatial, Logical-Mathematical**

Assessment

Process Ask students to write paragraphs that compare and contrast series and parallel circuits. **Charge flows through both types of circuits. A series circuit has only one loop through which charge can flow; a parallel circuit has more than one. Use PASC, p. 157. L2 LS Linguistic, Logical-Mathematical**

section 3 review

Summary

Series and Parallel Circuits

- A series circuit has only one path that current can follow. A parallel circuit has two or more branches that current can follow.
- Household wiring usually consists of a number of connected parallel circuits.
- Fuses and circuit breakers are used to prevent wires from overheating when the current in the wires becomes too large.

Electrical Power

- Electrical power is the rate at which electrical energy is converted into other forms of energy.
- Electrical power can be calculated by multiplying the current by the voltage difference:

$$P = IV$$

Electrical Energy

- The electrical energy used can be calculated by multiplying the power by the time:

$$E = Pt$$

- Electric power companies charge customers for the amount of electrical energy they use.

Self Check

1. **Explain** how electrical power and electrical energy are related.
2. **Discuss** why fuses and circuit breakers are used in household circuits.
3. **Explain** what determines the current in each branch of a parallel circuit.
4. **Explain** whether or not a fuse or circuit breaker should be connected in parallel to the circuit it is protecting.
5. **Think Critically** A parallel circuit consisting of four branches is connected to a battery. Explain how the amount of current that flows out of the battery is related to the amount of current in the branches of the circuit.

Applying Math

6. **Calculate** the current flowing into a desktop computer plugged into a 120-V outlet if the power used is 180 W.
7. **Calculate Electrical Power** A circuit breaker is tripped when the current in the circuit is greater than 15 A. If the voltage difference is 120 V, what is the power being used when the circuit breaker is tripped?
8. **Calculate** the monthly cost of using a 700-W refrigerator that runs for 10 h a day if the cost per kWh is \$0.09.

section 3 review

1. Power is the rate at which electrical energy is converted to another form of energy. The amount of electrical energy used is the power times the time the power is used.
2. Fuse and circuit breakers stop the flow of current in a circuit when the circuit becomes overloaded. This prevents the wires from becoming so hot they melt or start a fire.
3. The current is determined by the resistance of each branch. The voltage differences across each branch are the same.
4. A fuse or circuit breaker must be connected in series, not parallel, to the circuit it is protecting in order to stop the flow of current.
5. The current flowing out of the battery is equal to the sum of the currents in the four branches.
6. 1.5 A
7. The power is greater than 1.8 kW.
8. \$18.90 (30 days)

Real-World Problem

Purpose Students will design and test parallel and series circuits. **L1** **COOP LEARN**

Logical-Mathematical

Process Skills observe, communicate, classify, compare and contrast, recognize cause and effect, interpret data, use numbers, experiment, hypothesize

Time Required one class period

Materials The lightbulb voltage requirements should closely match the battery voltage so bulbs don't burn out quickly.

Alternate Materials Obtain economical low-voltage lightbulbs by cutting apart a string of Christmas minilights. Insulated wire may be used instead of foil.

Safety Precautions To avoid overheating the wire, students should hook up the battery only long enough to make observations.

Form a Hypothesis

Possible Hypothesis If a bulb is removed from a series circuit, all lights will go out. In a parallel circuit, the remaining bulbs will stay lit. Lights shine brightest in the parallel circuit.

Test Your Hypothesis

Possible Procedures Series circuits should have a single path with lights in a chain. Parallel circuits should have the lights on three separate paths.

Goals

- **Design** and construct series and parallel circuits.
- **Compare** and contrast the behaviors of series and parallel circuits.

Possible Materials

6-V dry-cell battery
small lights with sockets (3)
aluminum foil
paper clips
tape
scissors
paper

Safety Precautions

Some parts of circuits can become hot. Do not leave the battery connected or the circuit closed for more than a few seconds at a time. Never connect the positive and negative terminals of the dry-cell battery directly without including at least one bulb in the circuit.

Comparing Series and Parallel Circuits

Real-World Problem

Imagine what a bedroom might be like if it were wired in series. For an alarm clock to keep time and wake you in the morning, your lights and anything else that uses electricity would have to be on. Fortunately, most outlets in homes are wired in parallel circuits on separate branches of the main circuit. How do the behaviors of series and parallel circuits compare?

Form a Hypothesis

Predict what will happen to the other bulbs when one bulb is unscrewed from a series circuit and from a parallel circuit. Explain your prediction. Also, form a hypothesis to explain in which circuit the lights shine the brightest.

Differentiated Instruction

Visually Impaired Instead of using lamps, this activity can be performed using buzzers in the circuits. A visually impaired student could be paired with a sighted student to aid in circuit construction. **L2**

COOP LEARN **Kinesthetic, Visual-Spatial**

Alternative Inquiry Lab

Test a Hypothesis To extend this Lab into an Inquiry Lab, have students hypothesize how $V = IR$ applies to parallel circuits, and experiment to test those hypotheses. For this experiment, supply light bulbs with different power ratings. Have students use Ohm's law to calculate the current through each lightbulb. Then have them compare the results of their calculations with their observations.

Using Scientific Methods

Test Your Hypothesis

Make a Plan

1. As a group, agree upon and write the hypothesis statement.
2. Work together to determine and write the steps you will take to test your hypothesis. Include a list of the materials you will need.
3. How will your circuits be arranged? On a piece of paper, draw a large parallel circuit of three lights and the dry-cell battery as shown. On the other side, draw another circuit with the three bulbs arranged in series.
4. Make conducting wires by taping a piece of transparent tape to a sheet of aluminum foil and folding the foil over twice to cover the tape. Cut these to any length that works in your design.

Follow Your Plan

1. Make sure your teacher approves your plan before you start.
2. Carry out the experiment. **WARNING:** Leave the circuit on for only a few seconds at a time to avoid overheating.
3. As you do the experiment, record your predictions and your observations in your Science Journal.

Analyze Your Data

1. **Predict** what will happen in the series circuit when a bulb is unscrewed at one end. What will happen in the parallel circuit?
2. **Compare** the brightness of the lights in the different circuits. Explain.
3. **Predict** what will happen to the brightness of the bulbs in the series circuit if you complete it with two bulbs instead of three bulbs. Test your prediction. How do the results demonstrate Ohm's law?

Conclude and Apply

1. Did the results support your hypothesis? Explain by using your observations.
2. Where in the parallel circuit would you place a switch to control all three lights? Where would you place a switch to control only one light? Test your predictions.

Communicating Your Data

Prepare a poster to highlight the differences between a parallel and a series circuit. Include possible practical applications of both types of circuits. **For more help, refer to the Science Skill Handbook.**

LAB 415

Assessment

Oral Ask students to discuss why houses and buildings are wired in parallel and not in series. In a series circuit, all lights and appliances would have to be on at the same time; if one is off or burned out, no charge flows anywhere in the circuit. **L2 IS Logical-Mathematical**

Communicating Your Data

Have students use a computer graphics program to draw sketches of circuits for their posters. They can also use the computer to write any explanations they wish to include on their posters. **L3 IS Visual-Spatial, Logical-Mathematical**

Troubleshooting Students may design a circuit having two lightbulbs in parallel that are wired in series with the third light. Although interesting, this will not help students completely explore the behavior of each of the circuits independently. **L2 IS Visual-Spatial, Kinesthetic**

Expected Outcome When a light in series is removed, all the lights go out. In a parallel circuit, when a light is removed, others remain lit.

Analyze Your Data

Answers to Questions

1. In series, the current will stop and all bulbs will go out. In parallel, the charge will flow through other branches and the other bulbs will remain lit.
2. The lights are brighter in parallel because more current flows through each loop than the loop with three bulbs in a series circuit.
3. It will be brighter because of less resistance in the circuit.

Error Analysis Have students analyze their circuits for possible sources of errors. dead batteries, burned-out bulbs, poor connections with the aluminum foil

Conclude and Apply

1. Answers depend on student hypotheses.
2. between the battery and a wire leading to one side of the lights; along the wire that goes to only one of the lights

Understanding Literature

Pre-Reading Activity Ask students to do a clustering of terms that define who they are. Each student should put his or her name in the center of a cluster that includes elements that define his or her identity such as ethnic heritage, extracurricular activities, and family members. **L2** **IS**
Linguistic

Respond to the Reading

Connect Ask students if they can remember a time they were unfairly judged or misunderstood simply because their outward appearance was different from others around them.

Respond Tell students to be aware of their responses as they read about the invisible man. His description of himself might make them think that anyone who is judged by others is an outsider. Ask students how the text conveys that it is important for a person to have a positive view of himself or herself. **L2** **IS**
Linguistic, Logical-Mathematical

Answers to Questions

1. The narrator says he is "a man of substance, of flesh and bone, fiber and liquids."
2. because he has wired his ceiling with 1,369 lights
3. Check students' work.

Resistance The total electrical resistance of a series circuit is the sum of the resistance of each resistor in the circuit. However, the total resistance of a parallel circuit decreases, and the current flowing into the circuit increases, as more resistors are added to the circuit.

Invisible Man

by Ralph Ellison

I am an invisible man. No, I am not a spook like those who haunted Edgar Allan Poe; nor am I one of your Hollywood-movie ectoplasms.¹ I am a man of substance, of flesh and bone, fiber and liquids—and I might even be said to possess a mind. I am invisible, understand, simply because people refuse to see me. . . . Nor is my invisibility exactly a matter of biochemical accident to my epidermis.² That invisibility to which I refer occurs because of a peculiar disposition . . . of those with whom I come in contact. . . .

. . . . Now don't jump to the conclusion that because I call my home a "hole" it is damp and cold like a grave. . . . Mine is a warm hole.

My hole is warm and full of light. Yes, full of light. I doubt if there is a brighter spot in all New York than this hole of mine. . . . Perhaps you'll think it strange that an invisible man should need light, desire light, love light. Because maybe it is exactly because I *am invisible*. Light confirms my reality, gives birth to my form. . . . I myself, after existing some twenty years, did not become alive until I discovered my invisibility.

. . . In my hole in the basement there are exactly 1,369 lights. I've wired the entire ceiling, every inch of it. . . . Though invisible, I am in the great American tradition of tinkers. That makes me kin to Ford, Edison and Franklin.

1 The outer layer of a part of the cell.

2 The outer layer of skin.

Ralph Ellison

Understanding Literature

Prologue A prologue is an introduction to a novel, play, or other work of literature. Often a prologue contains useful information about events to come in the story. Foreshadowing is the use of clues by the author to prepare readers for future events or recurring themes.

Respond to the Reading

1. What clues does the narrator give that he is not really invisible?
2. Why does the narrator believe he is in the "great American tradition of tinkers"?
3. **Linking Science and Writing** Write a prologue to a fictional book describing Edison's invention of the lightbulb. Recall that a prologue is not a summary of the book. Rather, it can state general themes that the work of literature will address or set the stage or describe the setting of the story.

If all 1,369 light-bulbs were wired together in a series circuit, the electrical resistance in the circuit would be high. According to Ohm's law, the current in the circuit would be low and the bulbs wouldn't glow. If all the bulbs were wired in a parallel circuit, so much current would flow in the circuit that the connecting wires would melt. For the bulbs to light, the narrator must have wired them in many independent circuits.

Resources for Teachers and Students

Juneteenth, by Ralph Ellison, Random House, 1999

The African American Century, by Henry Louis Gates, Jr. and Cornel West, The Free Press, 2000

Reviewing Main Ideas

Section 1 Electric Charge

1. There are two types of electric charge: positive charge and negative charge.
2. Electric charges exert forces on each other. Like charges repel and unlike charges attract.
3. Electric charges can be transferred from one object to another but cannot be created or destroyed.
4. Electrons can move easily in an electrical conductor. Electrons do not move easily in an insulator.
5. Objects can be charged by contact or by induction. Charging by induction occurs when a charged object is brought near an electrically neutral object.

4. Electrical resistance is the tendency of a material to oppose the flow of electric current.
5. In an electric circuit, the voltage difference, current, and resistance are related by Ohm's law:

$$I = \frac{V}{R}$$

Section 3 Electrical Energy

1. Current has only one path in a series circuit and more than one path in a parallel circuit.
2. Circuit breakers and fuses prevent excessive current from flowing in a circuit.
3. Electrical power is the rate at which electrical energy is used and can be calculated with $P = IV$.
4. The electrical energy used by a device can be calculated with the equation $E = Pt$.

FOLDABLES Use the Foldable you made at the beginning of the chapter to help you review electric charge, electric current, and electrical energy.

Section 2 Electric Current

1. Electric current is the net movement of electric charges in a single direction. A voltage difference causes an electric current to flow.
2. A circuit is a closed path along which charges can move. Current will flow continually only along a circuit that is unbroken.
3. Chemical reactions in a battery produce a voltage difference between the positive and negative terminals of the battery.

CHAPTER STUDY GUIDE 417

Identifying Misconceptions

Materials D-battery (1), flashlight (1), bulb in socket (1), switch (1), wires (5), voltmeter (1)

Procedure Have each group set up a circuit. Ask students to predict the voltage between the two sides of the switch when it is open and when it is closed. Students can use voltmeters to test their predictions.

Expected Outcome Voltage varies across different points in a circuit and can exist without current flow. A voltage exists across the two sides of the switch when it is open. The voltage approaches zero when it is closed. **L2 COOP LEARN**

LS Logical-Mathematical, Kinesthetic, Visual-Spatial

Assess

Reviewing Main Ideas

Summary statements can be used by students to review the major concepts of the chapter.

Assessment Transparency

For additional assessment questions, use the *Assessment Transparency* located in the transparency book.

Assessment

FOLDABLES Have students use their Foldables to review the content of the chapter. On the back of the paper, have students write a paragraph about the nature of the forces between magnets.

Using Vocabulary

1. series circuit
2. static electricity
3. voltage difference
4. the law of conservation of charge
5. Resistance
6. charging by contact

Checking Concepts

7. C
8. C
9. C
10. A
11. B
12. A
13. A

Interpreting Graphics

14. circuit A— $2.6\ \Omega$; circuit B— $10\ \Omega$; circuit C— $30\ \Omega$; circuit D— $3.3\ \Omega$
The line is curved, descending from left to right. As the resistance becomes larger, the current decreases toward zero. As the resistance approaches zero, the current approaches infinity.
15. See student page.

Using Vocabulary

- | | |
|------------------------------|--------------------------------------|
| charging by contact p. 395 | law of conservation of charge p. 393 |
| charging by induction p. 396 | Ohm's law p. 405 |
| circuit p. 401 | parallel circuit p. 408 |
| conductor p. 395 | resistance p. 403 |
| electric current p. 400 | series circuit p. 407 |
| electrical power p. 410 | static electricity p. 392 |
| insulator p. 395 | voltage difference p. 401 |

Complete each statement using a word(s) from the vocabulary list above.

1. A(n) _____ is a circuit with only one path for current to follow.
2. An accumulation of excess electric charge is _____.
3. The electric force that makes current flow in a circuit is related to the _____.
4. According to _____, electric charge cannot be created or destroyed.
5. _____ is the result of electrons colliding with atoms as current flows in a material.
6. Charging a balloon by rubbing it on wool is an example of _____.

Checking Concepts

Choose the word or phrase that best answers the question.

7. Which of the following is a conductor?
A) glass C) tungsten
B) wood D) plastic
8. Resistance in wires causes electrical energy to be converted into which form of energy?
A) chemical energy
B) nuclear energy
C) thermal energy
D) sound

9. The electric force between two charged objects depends on which of the following?
A) their masses and their separation
B) their speeds
C) their charge and their separation
D) their masses and their charge
10. An object becomes positively charged when which of the following occurs?
A) loses electrons C) gains electrons
B) loses protons D) gains neutrons
11. Which of the following does NOT provide a voltage difference in a circuit?
A) wet cell C) electrical outlet
B) wires D) dry cell
12. A commonly used unit for electrical energy is which of the following?
A) kilowatt-hour C) ohm
B) ampere D) newton
13. Which of the following is the rate at which appliances use electrical energy?
A) power C) resistance
B) current D) speed

Interpreting Graphics

Use the table below to answer question 14.

Current in Electric Circuits

Circuit	Current (A)
A	2.3
B	0.6
C	0.2
D	1.8

14. The table shows the current in circuits that were each connected to a 6-V dry cell. Calculate the resistance of each circuit. Graph the current versus the resistance of each circuit. Describe the shape of the line on your graph.

Use the ExamView® Pro Testmaker CD-ROM to:

- create multiple versions of tests
- create modified tests with one mouse click for inclusion students
- edit existing questions and add your own questions
- build tests aligned with state standards using built-in State Curriculum Tags
- change English tests to Spanish with one mouse click and vice versa

15. Copy and complete the following concept map on electric current.

Thinking Critically

16. **Identify and Manipulate Variables** Design an experiment to test the effect on current and voltage differences in a circuit when two identical batteries are connected in series. What is your hypothesis? What are the variables and controls?
17. **Explain** A metal rod is charged by induction when a negatively charged plastic rod is brought nearby. Explain how the net charge on the metal rod has changed.
18. **Predict** You walk across a carpet on a dry day and touch a glass doorknob. Predict whether or not you would receive an electric shock. Explain your reasoning.
19. **Explain** The electric force between electric charges is much larger than the gravitational force between the charges. Why, then, is the gravitational force between Earth and the Moon much larger than the electric force between Earth and the Moon?

20. **Diagram** Draw a circuit diagram showing how a stereo, a TV, and a computer can be connected to a single source of voltage difference, such that turning off one appliance does not turn off all the others. Include a circuit breaker in your diagram that will protect all the appliances.

Applying Math

21. **Calculate Current** Using the information in the circuit diagram below, compute the current flowing in the circuit.

22. **Calculate Current** A toy car with a resistance of $20\ \Omega$ is connected to a 3-V battery. How much current flows in the car?
23. **Calculate Electrical Energy** The current flowing in an appliance connected to a 120-V source is 2 A. How many kilowatt-hours of electrical energy does the appliance use in 4 h?
24. **Calculate Electrical Energy Cost** A self-cleaning oven uses 5,400 W when cleaning itself. If it takes 1.5 h to clean, how many kilowatt-hours of electricity are used? At a cost of \$0.09 per kWh, what does it cost to clean the oven?
25. **Calculate Power** A calculator uses a 9-V battery and draws 0.1 A of current. How much power does it use?

Thinking Critically

16. The hypothesis should include the voltage doubling and the current doubling. Variables should include the voltage of the second battery. Controls should include testing the voltage of the second battery.
17. The net charge does not change since electrons are not lost nor gained, only displaced.
18. No, the glass doorknob is an insulator and resists being charged inductively.
19. The net charge on Earth or the Moon is nearly zero. So the electric force is very small.
20. Drawings will vary but should show the appliances in parallel branches with a circuit breaker in series with the voltage source.

Applying Math

National Math Standards

National: 1, 2, 9

Florida: MA.D.1.4.1

21. 0.8 V
22. 0.15 V
23. 0.96 kWh
24. 8.1 kWh, \$.73
25. 0.9 W

Multiple Choice

SC.8.E.6.3

1. Which of the following is true about two adjacent electric charges?
 - A. If both are positive, they attract.
 - B. If both are negative, they attract.
 - C. If one is positive and one is negative, they attract.
 - D. If one is positive and one is negative, they repel.

The figure below shows a negatively charged electroscope. Use the figure to answer questions 2 and 3.

SC.8.E.6.2

2. If a negatively charged rod is brought close to, but not touching, the knob, the two leaves will
 - A. move closer together.
 - B. move farther apart.
 - C. not move at all.
 - D. become positively charged.

SC.8.E.6.2

3. If a positively charged rod touches the knob, the two leaves will
 - A. move closer together.
 - B. move farther apart.
 - C. not move at all.
 - D. become positively charged.

4. When an object becomes charged by induction, which of the following best describes the net charge on the object?
 - A. The net charge increases.
 - B. The net charge decreases.
 - C. The net charge doesn't change.
 - D. The net charge is negative.

Use the figure below to answer questions 5, 6, and 7.

5. Which of the following is the same for each lightbulb?
 - A. current in the filament
 - B. voltage difference
 - C. electric resistance
 - D. charging by induction
6. Which of the following is the current that flows through lightbulb B?
 - A. 1.25 A
 - B. 0.67 A
 - C. 0.8 A
 - D. 1.5 A

7. Which of the following is the electrical power used by lightbulb A?

A. 8 W
B. 18 W
C. 12 W
D. 15 W

Gridded Response

Use the figure below to answer questions 8 and 9.

8. If the current in the circuit is 1.0 A, what is the total resistance of the circuit in ohms?
9. If the current in the circuit is 1.0 A, how much electrical energy, in kWh, is used by the circuit in 2.5 h?

Short Response

SC.2.A.2

10. Two balloons are rubbed with a piece of wool. Describe what happens as the balloons are brought close together.

11. The current flowing through a lightbulb is 2.5 A. The lamp is connected to a battery supplying a voltage difference of 12 V. What is the power used by the lightbulb?

Extended Response

Use the table below to answer question 12.

Resistance of Copper Wire	
Length (m)	Resistance (Ω)
10	0.8
20	1.6
25	2.0
30	2.4

12. Suppose you were asked to estimate the resistance of a 5-m length of wire based on data in the table. What additional information would be needed to make your estimate more accurate?
13. The filament in a 75-W lightbulb has a smaller electric resistance than the filament in a 40-W lightbulb. Describe two ways the filament in the 75-W bulb could be different from the filament in the 40-W lightbulb.

Test-Taking Tip

Be sure you understand all symbols on a table or graph before attempting to answer any questions about the table or graph.

Gridded Response

8. 12
9. 30

Short Response

10. They repel each other because they have the same charge.
11. $P = IV$ $2.5 \text{ A} \times 12 \text{ V} = 30 \text{ W}$

Extended Response

12. The temperature, material, and diameter of the 5 m wire must be the same as the wire in the table.
13. The 75-W bulb filament could be shorter or have a larger diameter than the 40-W light bulb.

Rubrics

Section Focus

Section Focus Transparency **Magnetic Appeal** **Chapter 14**

Your right thumb is magnetic when you feel the word "bustle." The scientists can create just this photo shows a magnet levitating over a ceramic plate. Magnetic levitation has applications ranging from advertising displays to high-speed trains.

1. What happens as one moves a magnet closer to a ring that can turn?
2. How do people use magnets in their daily lives?

L2

Section Focus Transparency **It Was an Age of Small Appliances** **Chapter 14**

Many common household items contain small motors. Some examples are fans, vacuum cleaners, and hair dryers. What other appliances are powered by motors?

1. Which items use electricity? Which items have motors?
Name some ways you use and electricity today.

L2

Section Focus Transparency **Flowing Current** **Chapter 14**

Electricity is often generated at power plants by burning fossil fuels. But fossil fuels are nonrenewable resources that which burn and can cause pollution. There are, however, renewable sources of energy.

What do you think the source of energy is for this hydroelectric power plant?
What do you think would happen if the flow of water through the dam were reduced?
What are three sources of energy that would not be considered renewable?

L2

This is a representation of key blackline masters available in the Teacher Classroom Resources. See Resource Manager boxes within the chapter for additional information.

Assessment

Assessment Transparency **Magnetism** **Chapter 14**

Directions: Write answers to the questions on the lines provided.

1. What is this experiment intended to prove?
a. that a lamp stand can hold a magnet
b. that a cotton thread is a support for a paper clip
c. that a magnet can overcome the force of gravity
d. that a paper clip can float in mid-air without touching anything
According to the diagram, what is happening to the paper clip?
f. It is falling.
g. It is rising.
h. It is changing shape.
i. It is suspended between the force of the magnet and the cotton thread restraining it.
What would happen to the paper clip if the cotton thread was removed?
j. It would fall.
k. It would rise, until it came in contact with the magnet.
l. It would continue to rise beyond the magnet.
m. It would remain suspended where it is.

Teaching

Teaching Transparency **Source of Mechanical Energy** **Chapter 14**

L2

Key to Teaching Strategies

The following designations will help you decide which activities are appropriate for your students.

- L1** Level 1 activities should be appropriate for students with learning difficulties.
- L2** Level 2 activities should be within the ability range of all students.
- L3** Level 3 activities are designed for above-average students.

ELL ELL activities should be within the ability range of English Language Learners.

COOP LEARN Cooperative Learning activities are designed for small group work.

LS Multiple Learning Styles logos, as described on page 12T, are used throughout to indicate strategies that address different learning styles.

P These strategies represent student products that can be placed into a best-work portfolio.

PBL Problem-Based Learning activities apply real-world situations to learning.

Magnetic Fields in 2-D and 3-D

This assignment will investigate a magnetic field both through direct measurement and by generalizing from two-dimensional situations. A magnetic field is a vector field and an electric current is a vector quantity. Thus, we will use vector calculus to find the magnetic field.

Part A: Preparing a Permanent Torus Generalized as a Magnetic Field

Materials

- 1. A torus (donut) about 4 cm in radius
- 2. A permanent magnet

Safety Precautions

- 1. Do not touch the magnet with your hands.
- 2. Do not use your head to hold it in place.

Procedure

1. After the string is placed in the torus, place the torus flat on the floor. Lay the wire in the hole of the torus and tie the ends of the paper and string together. The string must be long enough to go around the torus twice. Lay the paper around the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
2. Place the permanent magnet in the hole of the torus.
3. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
4. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

- 1. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 2. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

Part B: Preparing a Temporary Torus Dimensional Model of a Magnetic Field

Materials

- 1. A torus (donut) about 4 cm in radius
- 2. A permanent magnet

Safety Precautions

- 1. Do not touch the magnet with your hands.
- 2. Do not use your head to hold it in place.

Procedure

1. After the string is placed in the torus, place the torus flat on the floor. Lay the wire in the hole of the torus and tie the ends of the paper and string together. The string must be long enough to go around the torus twice. Lay the paper around the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
2. Place the permanent magnet in the hole of the torus.
3. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
4. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

- 1. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 2. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 3. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 4. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

Part C: Preparing a Permanent Torus Dimensional Model of a Magnetic Field

Materials

- 1. A torus (donut) about 4 cm in radius
- 2. A permanent magnet

Safety Precautions

- 1. Do not touch the magnet with your hands.
- 2. Do not use your head to hold it in place.

Procedure

1. After the string is placed in the torus, place the torus flat on the floor. Lay the wire in the hole of the torus and tie the ends of the paper and string together. The string must be long enough to go around the torus twice. Lay the paper around the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
2. Place the permanent magnet in the hole of the torus.
3. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
4. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

- 1. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 2. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

Observations

- 1. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.
- 2. Lay the string in the hole of the torus and tie the ends of the string together. The string must be long enough to go around the torus twice.

I. Testing Concepts

Directions: For each of the following, write the letter of the item or phrase that best completes the sentence.

1. A disk or diskette _____ magnetic material.

a. is not
b. is
2. The magnetic domain _____

a. is the smallest particle of a magnetic material
b. is the smallest particle of a substance that can be magnetized
3. _____ is the force of attraction between two magnetic poles.

a. Magnetic force
b. Magnetic field
4. _____ is the force of repulsion between two magnetic poles.

a. Magnetic force
b. Magnetic field
5. _____ is the force of attraction between a magnetic pole and a magnetic material.

a. Magnetic force
b. Magnetic field
6. _____ is the force of repulsion between a magnetic pole and a magnetic material.

a. Magnetic force
b. Magnetic field
7. _____ is the force of attraction between two magnetic materials.

a. Magnetic force
b. Magnetic field
8. _____ is the force of repulsion between two magnetic materials.

a. Magnetic force
b. Magnetic field
9. _____ is the force of attraction between two magnetic materials.

a. Magnetic force
b. Magnetic field
10. _____ is the force of repulsion between two magnetic materials.

a. Magnetic force
b. Magnetic field

Answers

Science Content Background

section 1 Magnetism Magnets

In 1269 Petrus Peregrinus published an article describing the properties of lodestone. He reported that if it is hung freely, lodestone orients in a north-south plane but does not point exactly to true North. He also noted that like poles repel and unlike poles attract, and that iron can be magnetized by contact with it.

Magnetic Materials

A common definition of magnetism is the ability to attract iron. Steel is composed of iron and carbon molecules that form a strong material used in many common products. Steel is magnetic because it contains iron. This property allows cars to be lifted by electromagnets in junkyards and soup can lids to be held by the magnet on a can opener. Cobalt and nickel are also attracted to magnets. Iron, nickel, and cobalt are called ferromagnetic materials.

section 2 Electricity and Magnetism Electric Current and Magnetism

Frictional forces usually act in the opposite direction to the motion of an object. For example, air resistance on a car traveling north acts toward the south. The magnetic field produced by an electric current acts at right angles to the direction of the current. The right-hand rule shows the direction of the magnetic field in a wire. The thumb points in the direction of the conventional current, or the way a positive charge would flow in a wire. The fingers then show the direction of the magnetic field.

section 3 Producing Electric Current From Mechanical to Electrical Energy

Niagara Falls generates significant tourism and electricity. In order to keep the tourism industry vibrant, only about 55 percent of the water that goes over the falls is diverted into turbines in the daytime; at night this amount is increased to 75 percent.

Transformers

The ability of alternating current (AC) to be transformed into higher and lower voltages gives it an advantage over direct current (DC) in electrical power distribution. Increasing the voltage does not create energy because current decreases as voltage increases. This increase does, however, result in more efficient transmission. This efficiency becomes significant as electricity travels through miles of wire.

IDENTIFYING

Misconceptions

Find Out What Students Think

Students may think that . . .

All metals are magnetic.

Students are aware of common properties of metals such as the fact that they are good conductors of electricity and heat. It is natural for students to extend these similarities to magnetism and think that all metals can be attracted by a magnet. Lack of first-hand experience with magnets and metals makes this misconception common, even in adults. In addition, iron alloys are omnipresent, so people's limited experiences with magnets may lead them to believe that all metals are magnetic.

Activity

Ask students to draw two columns on their papers and label one *Attracted to a Magnet* and the other *Not Attracted to a Magnet*. Then ask that they place the following words into the appropriate columns: *iron, lead, plastic, copper, steel, aluminum, nickel, cobalt, oxygen, and wood*. Have students form groups and discuss any differences in opinion about which items belong in each column. The iron, steel, nickel, and cobalt are attracted to a magnet, and the lead, plastic, copper, aluminum, oxygen and wood are not. [L2]

Dalles and John Heaton/Corbis

Activity

Provide students with different metals and nonmetals and with magnets with which to test them. The materials should include easily obtainable ferromagnetic materials such as iron and steel as well as nonferromagnetic metals such as aluminum and copper. Make sure to

include nonmetals, even though most students will realize that these are not magnetic.

- Have students use the magnets to test for attraction and sort materials that are and are not magnetic.
- On the board, make a class list of the results.
- Help students realize that iron (Fe) is a magnetic material, so things made from iron, including steel, are attracted to magnets.
- Explain that cobalt (Co) and nickel (Ni) are also magnetic materials.
- Have students locate iron, cobalt, and nickel on a periodic table of the elements. Point out that on the periodic table, these metals are in the same row and are next to each other. [L2]

Assess

After completing the chapter, see *Identifying Misconceptions* in the Study Guide at the end of the chapter.

Chapter Vocabulary

magnetism, p. 424
 magnetic field, p. 425
 magnetic pole, p. 425
 magnetic domain, p. 429
 electromagnet, p. 432 •
 solenoid, p. 432
 galvanometer, p. 434
 electric motor, p. 435
 electromagnetic induction, p. 438
 generator, p. 438
 turbine, p. 440
 direct current (DC), p. 442
 alternating current (AC), p. 442
 transformer, p. 443

• KAT Vocabulary

Science Journal Student responses will vary, but may include magnets attract some metals, likes repel, and opposites attract.

INTERACTIVE CHALKBOARD

with Image Bank

PowerPoint® Presentations

This CD-ROM is an editable Microsoft® PowerPoint® presentation that includes:

- a pre-made presentation for every chapter
- interactive graphics
- animations
- audio clips
- image bank
- all new section and chapter questions
- Standardized Test Practice
- transparencies
- Foldables directions
- links to glencoe.com

- 3 Producing Electric Current
Lab: Electricity and Magnetism
Lab: Controlling Electromagnets
 *Virtual Lab: How does a generator work?*

A Natural Light Show

Have you ever seen an aurora? This light display occurs when blasts of charged particles from the Sun are captured by Earth's magnetic field. Atoms in the upper atmosphere emit the aurora light when they collide with charged particles that result from the Sun's blasts.

Science Journal List three things you know about magnets.

422

Theme Connection

Systems and Interactions Electricity and magnetism are related. Electrical flow causes magnetic effects, and moving magnets are used to produce electrical energy.

About the Photo

Aurora These colorful light displays occur primarily in the upper latitudes of the Northern and Southern Hemispheres. Auroras that occur in the Northern Hemisphere are called aurora borealis or northern lights and those in the Southern Hemisphere are called aurora australis or southern lights.

Start-Up Activities

The Strength of Magnets

Did you know that magnets are used in TV sets, computers, stereo speakers, electric motors, and many other devices? Magnets also help create images of the inside of the human body. Even Earth acts like a giant bar magnet. How do magnets work?

1. Hold a bar magnet horizontally and put a paper clip on one end. Touch a second paper clip to the end of the first one. Continue adding paper clips until none will stick to one end of the chain. Copy the data table below and record the number of paper clips the magnet holds. Remove the paper clips from the magnet.
2. Repeat step 1 three more times. First, start the chain about 2 cm from the end of the magnet. Second, start the chain near the center of the magnet. Third, start the chain at the other end of the magnet.
3. **Think Critically** Infer which part of the magnet exerts the strongest attraction. Compare the attraction at the center of the magnet with the attraction at the ends.

Magnet and Paper Clip Data

	Paper Clip Chain (number of clips)
Trial 1 (end)	
Trial 2 (2 cm)	
Trial 3 (center)	
Trial 4 (other end)	

FOLDABLESTM Study Organizer

Using Magnets Many devices you use contain magnets that help convert one form of energy to another. Make the following Foldable to help you understand how magnets are used to transform electrical and mechanical energy.

STEP 1 Fold a sheet of paper in half lengthwise.

STEP 2 Fold the paper down about 2 cm from the top.

STEP 3 Open and draw lines along the top fold. Label as shown.

Summarize As you read the chapter, summarize how magnets are used to convert electrical energy to mechanical energy in the left column, and how magnets are used to convert mechanical energy to electrical energy in the right column.

Purpose Use the Launch Lab to illustrate the fact that the strength of a magnetic field varies over the length of a bar magnet. **L2 ELL LS Kinesthetic**

Preparation Test the bar magnets to see approximately how many paper clips each team will need. Small clips make it easier to observe differences in field strength.

Materials bar magnet, many small paper clips of the same size
